19, 40, 60, 80, 100, 120, 138, 159, 180, 200, 218, 238, 257, 279, 300, 320, 340, 362, 383, 403, 423, 444, 463, 484, 503, 524.

ERRATA.

Page 43, col. iii., line 4 from bottom. Omit "Swedish and."
Page 209, col. ii., line 35 from bottom. For "Marx" read "Max."
Page 210, col. i., line 6. For "Wooley" read "Woolley."
Page 421, col. ii., line 8 from bottom. For "here" read "hero."

The Nation.

NEW YORK, THURSDAY, JANUARY 1, 1903.

The Week.

In an interview published on Friday, Senator Burrows declares that the Beet-Sugar Convention to be held in Washington City on the 8th of January will decide whether the Cuban treaty of reciprocity shall be ratified or not. That is, the Convention will decide whether a reduction of 20 per cent. from the Dingley rates of duty on Cuban sugar will materially injure the beet-sugar industry in the United States. He thinks it most likely that they will sanction the treaty, but if they do not, then the same Senators who blocked the Cuban relief bill last year will oppose the present treaty. He believes that they will be able to defeat it, since debate in the Senate is unlimited and a two-thirds vote is required for ratification; while the Democrats will try to foment quarrels in the Republican ranks. "The sugar beets of the West," he says in conclusion, "may expect as much consideration as was given the codfish of Massachusetts." Nobody can object to that phase of the case. Let us have fair play, and ratify both the Newfoundland treaty and the Cuban treaty, and then we shall be in better temper to consider the French treaty when Senator Cullom calls it up.

Article viii. of the new treaty of reciprocity with Cuba needs amendment, either in form or in substance, or both. The text is as follows:

> "The rates of duty herein granted by the United States to the Republic of Cuba are, and shall continue during the term of this convention, preferential in respect to all like imports from other countries; and, in return for said preferential rates of duty granted to the Republic of Cuba by the United States, it is agreed that the concession herein granted on the part of the said Republic of Cuba to the products of the United States shall likewise be, and shall continue during the term of this convention, preferential in respect to all like imports from other countries."

These words may mean merely that the most-favored-nation clause in our treaties with other countries shall not operate to admit the goods of those countries on the same terms as Cuban goods, without special treaties to that end. This would be the interpretation most commonly put upon it, since any other meaning would tie our hands for five years, and prevent us from making similar treaties with Germany, France, Great Britain, Russia, Brazil, or any other sugar-producing country. Yet the language used may be held to have the latter signification. "The rates of duty herein granted by the United States to the Republic of Cuba," it says, "are and shall continue, during the term of this convention, preferential in respect to all like imports from other countries." There is no exception here even of the Philippines, which, under the rulings of the Supreme Court, are another country, although subject to our legislation. There should be no clauses in the ratified treaty open to two interpretations. Especially should there be no clause restricting us as buyers of sugar at low rates of duty to one small patch of the earth's surface, and tying the hands of future Presidents and Congresses in that behalf.

The question of the "open door" in the trade of eastern Asia has come up again (as we predicted it would) in connection with the discriminating duty on Manila hemp exported from the Philippines. The Philippine Commission, in its wisdom, put an export duty of $7.50 per ton on that article when shipped to other countries than the United States. This discrimination was ratified by our Congress. It received little attention from the press at the time, and it is not known even now what influences contributed to so glaring an infraction of the principles we have contended for in the trade of the Orient. In searching for the guilty parties, one would naturally look to see who profits by the transaction. Evidently they are the manufacturers of cordage in the United States. If they can get their raw material $7.50 per ton cheaper than their foreign competitors, they can supplant them in neutral markets. But foreign governments have made representations to our Government on this matter. Germany and England have pointed it out as an infraction of the open-door policy, and have expressed the hope that it may not be continued to the hurt of their subjects. Secretary Hay has turned the correspondence over to Secretary Root, who has transmitted it to the Senate Committee on Philippine Affairs to be considered in connection with the pending Philippine tariff bill. Of course, there is only one thing to do, and that is, to repeal the discriminating export duty. Otherwise, our open-door policy will be in ruins in the Orient whenever it suits other countries to disregard it. Both England and Germany have it in their power to retaliate. They can make us lose more in other places than we shall ever gain from this export duty on Manila hemp. The honor of the country is concerned in undoing as soon as possible a transaction which bears so sinister an appearance.

An officer now in the Philippines who has had occasion to employ considerable labor for military purposes, writes us in opposition to the theory that the Filipinos will not perform manual labor. He states that there are at present about 200 Tagalog workmen employed in the Manila arsenal, making saddles, working on ammunition, etc. This kind of skilled labor seems to give absolute satisfaction. Ilocano day laborers at Vigan were found to be industrious and willing when put at the hardest tasks, for which they were paid $6.50 and $7.50 per month. Our informant thinks that a great deal depends on the way the men are handled, and adds, "I have seen Americans swear at natives for not understanding orders given in such a miserable apology for Spanish that not even a native Spaniard could have understood, much less a Tagalog. I often wonder that we Americans get any work out of them at all." This officer is of the opinion, however, that Chinese laborers are more industrious, thrifty, and economical than Filipinos, but he believes that in the long run they will only injure the country if they are brought over in such numbers as to enable American capital to obtain a speedier return than would otherwise be possible. So far from believing in Professor Jenks's proposed system of coolie slavery, our correspondent thinks that the Filipinos should be allowed to develop themselves—slowly, at first, if necessary, but none the less in their own way. Unfortunately, the capitalistic influences behind the proposed exploitation of the Philippines are not of the kind to wait for any normal development of the archipelago, unless they are compelled to do so.

Gen. Miles seems to have some very curious notions about the duties of a commanding general in regard to criticisms of army officers for alleged cruelties. If he were to follow the example of at least one of his superiors, he would content himself with denying any and all charges, and would simply decline to investigate and see for himself. This was the War Department's policy in the case of the Catholic friar who was murdered by the water-cure. Gen. Miles refuses, however, to follow any such bad example and has insisted upon making, or having made, some rigid investigations of the conduct of officers never accused heretofore—among them Capt. R. L. Howze, Sixth Cavalry, whom Mr. McKinley made a brigadier-general of volunteers for alleged brilliant services. Instigated by Gen. Miles, Col. Foote of the Twenty-eighth Infantry has unearthed some more cases of water-cure. It is quite characteristic that the press reports insinuate that Filipino money is being used to prosecute Major Glenn, who is now being tried a second time—as if money could be used in any way in

connection with an army court-martial. There never was a plainer illustration of the fact that "murder will out." President Roosevelt, Secretary Root, and any number of subservient generals have declared again and again that there were only a few cases, and that the offenders had been punished. Now, a year after the first cases were exposed, more and more are leaking out, and the War Department is forced to admit, as in the case of Friar Augustine, the truth of the anti-Imperialist charges. Gen. Miles in this matter is certainly putting Secretary Root to the blush.

The artists who are petitioning Congress to put all works of art produced fifty years ago on the free list, very properly hope for the support of the President. This Mr. Roosevelt can hardly refuse, for the duty on works of art is perhaps the single schedule that could be abolished without raising a howl from some afflicted infant industry. The measure which is to be presented to Congress is framed to meet protectionist susceptibilities. It retains the duty on paintings and sculpture not fifty years old, thus preserving—although no American artist desires state relief from foreign competition—a semblance of protection. The President should not fail to see that here is an easy way of proving to an incredulous people that the tariff can be revised downward by its friends. If the beet-sugar people came to him saying "Please free our beets from the galling discrimination of a needless subsidy"; if the Gloucester fishermen should cry for "free fish and no favor," how could the President refuse them? How, then, can he fail to give ear to those less vociferous persons, the artists of America, when they plead to him the cause of self-respect and of civilization?

Should a Trust, that, like the Standard Oil, raises the price of fuel during a winter when the usual supply has been restricted be considered "good" or "bad" according to Mr. Roosevelt's moral scale for mergers? Doubtless, the President knows just what companies he has in mind when he speaks of bad Trusts; but he is not inclined at present to share his knowledge with others, so that we are left almost wholly to conjecture in this matter. So let us ask whether there is any method by which this particular Trust could be disciplined in case the President should decide that it deserves chastisement. It is often said that the Standard Oil Company is in no way affected by the tariff, and this concern has often been employed to illustrate the theory that the Trusts can not be reformed by making changes in the Dingley Bill. Now we will not assert that the tariff was a factor in the original growth of the oil combination, but we should like to call the President's attention to the fact that the law of 1897 contains a "little joker" that is of interest in connection with the recent advance in oil. Petroleum and its products occupy a conspicuous place on the present free list, but the act has a little proviso to the effect that, "if there be imported into the United States crude petroleum, *or the products of crude petroleum*, produced in any country which imposes a duty on petroleum or its products exported from the United States, there shall in such cases be levied, paid, and collected a duty . . . equal to the duty imposed by such country." Now this applies, obviously, to Russia, the only competitor that could seriously annoy the Standard Oil Company. Oil produced in any country that can offer no effective competition is admitted free of duty, but the only product that could possibly mitigate the conditions caused by the recent rise of price is rigorously excluded. It is a fair inference that the President believes in preserving the "home market" for the Trusts; but we wonder whether he would consider this principle applicable to bad Trusts as well as good.

A former Representative in Congress and a former Federal judge has just given his views on the "lily white" movement in North Carolina, and in doing so Mr. H. G. Ewart uses such "strong language" about ex-Senator Marion Butler that it "cannot be printed." We are certainly of the opinion that the movement can be properly characterized only by the use of some very forcible adjectives. For downright selfishness it would be hard to parallel the conduct of those soulless leaders like Senator Pritchard, who, after having got into power by the aid of negro voters, are now ready to abandon them and to acquiesce in their deprivation of the suffrage. As Mr. Ewart points out, the Democratic boards of registration, despite unfair tests and frequent discriminations due to local prejudices, still found it right and proper to allow votes to six thousand negroes, the very best men of their race. To refuse to allow these men to take part in the councils of the Republican party is, as Judge Ewart says, "not only a cowardly, but a most asinine policy." It certainly smacks of "treachery and base ingratitude," no matter how much its apologists may seek to conceal its real meaning by hypocritical explanations that it is all done in the interest of the negro. The only redeeming feature of the situation is the readiness of men like Mr. Ewart to speak the truth.

Every question about Platt's reëlection has been met by certain people with the reply: "Anyway, he has the votes." But has he? The answers which the *Evening Post* has received from Republican members of the Legislature do not indicate that this is certain. There are in the Senate 28 Republicans and in the Assembly 89, a total of 117 on joint ballot. Assuming that the seat made vacant by the death of Senator Trainor cannot be filled in time for the election of United States Senator, the successful candidate must have 100 votes, the total vote being 199. In other words, if there are 18 Republicans in the Legislature who will not vote for Senator Platt he has *not* the votes. Now, of the 117 Republicans in the Legislature, only 28 have replied openly to the *Evening Post's* letter of inquiry. No less than seven, or a quarter of all who have replied, have clearly indicated that they are as yet unwilling to commit themselves; several others, though answering in terms probably intended not to anger Platt, have carefully left loopholes for use in case of need. As many as eighty-nine members have not replied at all. This might be taken as indifference to the *Evening Post's* canvass if it were not that the Simon-pure Platt legislators have hastened to reply. But where are the others? Do they not care to "please the old man" also? Are they, perhaps, cogitating about a political future in which Senator Platt is not an important factor?

Chicago householders are likely in the future to have their dwellings plainly labelled to this effect, viz.: The woodwork, plaster, decoration, plumbing, painting, all duly certified by placard as the work of respective branches of the associated building trades. It is to be presumed that only those who are opposed to the cause of labor will protest against the liberal use of the union label, for the labor unions have made of this identification and consecration of their handiwork a fixed policy. Their programme clearly presupposes novel ethical views of a strictness which orthodox Calvinism can hardly equal. The unions distinguish between fair wainscoting *(i. e.*, put up by unionists), and unfair wainscoting *(i. e.*, the same material and workmanship, but constructed by non-unionists); similarly are distinguished good plumbing and bad plumbing, not according to the working of cocks and traps and valves, but according to the union ticket in the pockets of those who made and laid the pipes; or, again, honorable wallpaper is that pasted by the paperhangers' union on union plaster, while dishonorable wallpaper is the same paper hung by anybody else. We can imagine that this discrimination may have troubled Chicagoans, little given to transcendental categories, and the use of the union label is doubtless a convenience, just as it would be a practical help to the Calvinists we have already cited if all except the elect were plainly branded with the mark of the beast.

From the point of view of the unions, however, this form of fetishism is a little confusing, and likely to lead them into all kinds of unprofitable speculation quite apart from their practical aims. Recently, an engineer in a new apartment building in this city refused to make trifling repairs on a leaking steampipe because that was the work of the steamfitter. The steam went through the building for a day or so, bringing down union plaster and warping union woodwork. The landlord of the building has had a costly lesson in transcendental unionism. Again, a lady in the course of refitting her house had two antique eighteenth-century mantelpieces put in. Their advent was reported by the workmen, and soon arrived the walking delegate to inquire if the mantelpieces were union-made. There were no unions in New York State before 1800, was the reply. Then they are not union-made and must come out, was the inexorably logical demand. The lady, with a truly feminine misconception of abstract reasoning, defied the walking delegate, who promptly stopped the work, leaving the house minus the front stairs and other necessaries. For three months this courageous woman has stood by her colonial fireplaces, and used the back stairs in a dismantled house—all because she could not understand why eighteenth-century joinery was, transcendentally considered, "unfair."

Chicago, like New York, is appalled at its water waste. It is estimated that fully 75 per cent. of the water pumped into the pipes is lost because of carelessness and leakage. The per-capita consumption now reaches the enormous figure of 164 gallons a day, although 70 gallons would be an extravagant figure. It is estimated that the city throws away $1,832,483 a year merely for pumping this wasted water. Just as is the case here, Chicago is face to face with the necessity of spending millions for new waterworks unless it can cut down the consumption. The City Engineer, who is much aroused over the situation, has made the far from radical recommendation that meters be placed on 40 per cent. of the faucets now in use. He is convinced that if this is done there will be a saving of $500,000 a year, and that the city could provide for any legitimate increase in the demand for water for years to come. New York already has meters in its factories and business houses, but it must soon come to their installation in apartment-houses and private dwellings. That there will be some prejudices to overcome is to be expected. As the Chicago *Evening Post* points out, however, this prejudice is wholly irrational. It is of the opinion that the change to meters would bear less heavily on small families and upon the very poor.

President James of Northwestern University, in appointing a "university drummer," has only given official standing to a customary practice. In older days in the Middle West it was not uncommon to send out a kind of academic gospel wagon, accompanied by the college glee club. This combination proved irresistible to the sub-freshmen of a ruder time. In the East, subtler methods have been employed; but the team captains who visit the great preparatory schools, and the alumni who teach in such institutions, have been, in a quite honorable sense, amateur university drummers. President James's drummer is apparently to be a professional, whose duty will be to explain persuasively to uncommitted schoolboys and undecided parents the advantages of Northwestern University. To many this will seem a method calculated to inculcate in the freshmen of Professor James's institution an inordinate self-esteem. While the vision of four hundred university drummers (assuming that President James's innovation becomes a precedent) descending upon the preparatory schools of the country is not reassuring, judgment should be suspended until the methods of the academic advance agent are known. Will he hold before the high-school boys the scholarly attainments of his faculty and the specific advantages of the curriculum of his university, or will he suggest other careers open to talents? It is significant in this regard that an Eastern university, thoroughly beaten this season on the football field, expects to capture all the school athletes next fall. The teams of its chief rival are so strong that no newcomer may enter there with a reasonable hope of ever "making the 'varsity." A skilled university bagman would doubtless find many similar ways of making all things work together for the good of his alma mater.

The six British hatters who have been forbidden to land at the port of Sydney may console themselves with the thought that their case is a parable. The future historian will grasp at that strange perversion of the idea of empire which made the Commonwealth of Australia, after voting ships to the British navy and hurrying troopers to the veldt, refuse admission to six British workmen who were seeking to better their fortunes in a British colony. Of course, there is a reason for so unreasonable an action. An Australian law, framed to prevent the importation of laborers during strikes, is suddenly found to apply to all labor imported under engagement. Naturally, there is a labor union to force Premier Barton's reluctant hand, and now the official attitude of Australia is, as the London *Economist* puts it, "that the set of workingmen happening at this time to have acquired domicile in Australia have some inherent title to monopolize all the employment which is going there." Meanwhile, the six rejected hatters are likely to be as historic as the Burghers of Calais. Their mishap shows how inevitably empire fails to meet the normal conditions of civilized life, and how powerless it is, both against such short-sighted selfishness as is here illustrated, and against the healthy growth of local or national spirit. Religious fanaticism, militant commerce, personal ambition have time and again built up great empires, but not one of them has stood for any length of time except through the military supremacy of the ruler or the cowardice of his subjects. How little it is true that the empire means peace will be felt when it is remembered that while Australia is treating these six hatters like criminals or madmen, Mr. Chamberlain is on his way to the latest imperial conquests, seeking to repair the havoc to make which Australia gladly paid her share in money and in the blood of her best.

That the Sultan of Morocco should be hard pressed by a native rival is nothing new. For years, every Sultan has had to fight for his throne. In the present rebellion there would be no cause for special interest, much less for the flutter of alarm which the news is causing in Europe, were it not that the Moroccan trouble has far wider bearings than the mere domestic concerns of the Sultanate. The truth is that Morocco has for a long time been regarded as a possible explosion-point. Within a twelvemonth, Mr. Bryce, with that sagacity and stored information which mark him out among statesmen, has predicted that Morocco would be the next scene of Imperialistic exploitation. The Sultanate has been closely hemmed in and almost invaded by foreigners. The French have steadily pushed westward from Algiers; and the common expectation in France has been that all the littoral up to the Straits will one day be under the tricolor. The Franco-Spanish *entente*, including, as it has been supposed, a secret treaty covering new delimitations in North Africa, has been taken as a sure index to French ambitions in Morocco. With this has been put, by suspicious observers in England and the Dreibund, the fact that Russia not long since established an embassy in Tangier. This was held to be, in view of the fact that there are practically no Russians in the Sultanate, a somewhat ostentatious notification that the Franco-Russian alliance was going to have something to say about the partition of Morocco. Possibly, a new Anglo-French treaty of African delimitation may settle the whole question amicably. The occasion is obviously one for thanking our stars that here, at any rate, is an international problem with which we are not called upon to meddle. Would that the Philippines were to us even as Morocco!

THE RIGHT KIND OF ARBITRATION.

After mature reflection, President Roosevelt has wisely decided not to accept the rôle of arbitrator between Venezuela and the European Powers, but to adhere to his first recommendation, that the questions be referred to the Hague Tribunal. By so doing he has avoided serious dangers for the country and for himself, and if his conduct in the future course of the controversy shall be governed by equal prudence, we shall have reason to be devoutly thankful. Great care must be taken to avoid accidental explosion of one kind and another in the progress of the settlement. The nearer we are to the scene of the trouble, and the more we are mixed up with it, the more chances there will be of an accident which may imperil our own peace and quiet.

If this were a difficulty between Germany and Turkey, or between England and Sweden, and our President were asked to take the place of arbitrator, the reasons, if any, for declining would be quite different from those operating in the present case. The Monroe Doctrine is lodged, without any clear definition, in the minds of millions of Americans who are ready to take fire at any time at any supposed infraction of it or disrespect to it. All these people can understand arbitration by an impartial tribunal like the one established at The Hague, and will be disposed to acquiesce in it. An arbitration by President Roosevelt would keep us dangerously close to the *corpus delicti* for months, would expose his decisions to criticism by the Democrats as truckling to foreigners, and as yielding some part of the precious Doctrine to further assault by Old World monarchies. The fear of attack by political opponents would operate as a bias in his own mind. It is the part of prudence for us to push the controversy as far from our own shores as possible. Having lodged it securely at The Hague, we should take the attitude of respectful silence pending the decision.

The question, as regards ourselves, having been thus happily disposed of, there seems to be no place to send the dispute except to the Hague Tribunal, or at all events none so fitting as that. The reasons why may be briefly recapitulated. In the first place, that court has been established by the solemn act of civilized nations expressly to try such causes. It is peculiarly fitted to try them. It has judges already appointed for the purpose. Having been named beforehand, they are beyond the reach of suspicion of bias. General rules of procedure have been laid down, and the mode of creating special rules for special cases has been fixed. The Court has just begun to discharge its high duties. It still has its reputation to make, and to this end all cases which actually arise and are suited to its powers and jurisdiction, ought to be sent to it. It is the bounden duty of every government which is a party to those agreements to avail itself of the moral grandeur which the Hague Tribunal stands for; and by so doing to add to the dignity and weight of its authority in the coming time. Equally is it the duty of the non-signatory Powers to avail themselves of it, a door having been left open for them to come in of their own choice. It is gratifying to know that Venezuela is ready to accept the jurisdiction of the Hague Tribunal. The dispatches say that she accepts it on certain conditions, but there is no doubt that we can name the conditions upon which she will put in her appearance. Of course, the blockade and all other acts of war will cease as soon as the terms of arbitration are settled.

To contribute to the world's peace, to diminish the loss and misery which war entails, was the first aim of the Hague conferees. To create a body of international law which the world will accept and be governed by was the next part of their programme. Obviously, this is not to be done by decision of King Oscar, or President Roosevelt, or Emperor William. However learned and eminent may be the counsellors chosen by them to study the law and the facts in given cases, they cannot command the attention and carry the weight which belongs to a tribunal specially designated for the trial of such causes. In every country there are as good lawyers off the bench as on it, but the bench alone speaks with authority. Its decisions alone go into the books and become precedents and rules of conduct for generations of men. So, too, will the rulings of the Hague Tribunal operate upon the public opinion which directs the policy of nations. A decision of the Venezuelan case by President Roosevelt would indeed be interesting and would settle that particular case, but it would not settle a similar case arising in another part of the world, while an identical decision by the Hague Court would most likely be adhered to in future disputes, and would avoid the necessity of a new trial where the grounds of controversy were the same. This is the very *raison d'être* of a court, whether local, or national, or international.

These reasons for sending the case to the Hague Tribunal are general in their nature, applying to the whole world, and to the future as well as the present time. Those which are peculiar to the parties themselves are perhaps even stronger. The man who goes into a powder magazine with a lighted candle exposes the region roundabout to great danger, but the risk to his own safety is greatest of all. Any piece of bad luck in Venezuelan waters, a mistake of orders, an error of eyesight, or the act of a rash and hot-tempered officer, might produce a condition of affairs uncontrollable by all the governments concerned. It is not pleasant to dwell upon such contingencies, and we therefore dismiss them with renewed thankfulness that they have been happily avoided.

SILENCING THE PRESS.

St. Petersburg dispatches recently gave a list of topics about which the Czar had commanded all Russian editors to be silent. Napoleon's muzzling or manipulation of the press is an old story. His suppression of free debate extended not only to newspapers, but to book-publishers and even romance-writers. "A printing-house," he said, "is a powder-magazine into which every fool must not be allowed to enter." Only last year a German writer published a volume about Napoleon's control of the press of Germany. Journal after journal was confiscated, while those left alive were kept under police surveillance and most rigorous rules. In general, the Emperor lived up to his cynical saying that balls and the opera furnished "excellent subjects for editorials," but that he could not have the gazettes "meddling with politics."

We in America laugh or rage at all this, in our complacent way, but it is a question if our own newspapers are not more and more silenced by ukase or *mot d'ordre*. With all the enterprise, with all the prying curiosity and the vaunted publicity of the American press, there are too many signs that some topics are forbidden it. It is not Czar or Emperor who issues his commands—only a boss or an advertiser; but the result is the same. Inasmuch as the people have come to look to the newspapers for the exposure of villanous politicians or rotten financial schemes, it is obvious that the service of suppressing the news and burking discussion is one that jobbers in politics or in stocks can afford to pay for handsomely. Silence is to them golden indeed. It is so very simple. You do not have to say a word in favor of men whom you abhor or measures that you know to be shady; you merely have to keep still about them, and write with Napoleonic zest on balls and the opera.

Close readers of our indefatigable metropolitan press must have been struck, for example, with its almost complete silence of late about two subjects of prime importance. One of them was the financial operations of a large insurance company. Its plans were so questionable that they were fought and enjoined in court, and finally abandoned by the promoters in alarm; but only one New York newspaper made any editorial reference to the matter. It was a case where a fundamental principle of finance was at stake, where great interests affecting many people were involved, where insurance commissioners in several States were in full outcry, yet the "great met-

ropolitan dailies," as they love to call themselves, were dumb. The reason? Why, there was no concealment of it. The large company was a large advertiser, and the ordinary prudence of the counting-room was enough to restrain the editor's pen.

The other subject which New York city newspapers, as by one consent, never mention is the proposed reëlection of Senator Platt. Not one of them supports him. They have not sunk so low as that. Even his personal organ excludes him from its editorial page. But in no columns, except those of the *Evening Post*, is there any reference to his candidacy, any discussion of his fitness, any concern expressed over the impending disgrace of the State by having a decrepit corruptionist represent it in the Senate again. Why is this? It cannot be that Democratic papers have any political reason for staying their hand. If Republican editors have had any fear that they might offend their readers by attacking Platt, they must have seen from the letters which the *Evening Post* has been publishing that Platt is a stench in the nostrils of decent Republicans. They loathe him, and would gladly see him deposed. Why do they get no help from the *Tribune*, for example? Why is it absolutely silent to-day on a subject about which, in other days, it has been fiercely voluble?

We are not going to intimate unworthy motives in its case or any other; though any one in search of them would have to look no further than to Platt's open alliance with the great interests which are doing so much to "commercialize" both politics and the pen. We prefer to take the explanation commonly offered. Platt is invincible. He is "a bad lot," but it is impossible to defeat him. The people know perfectly well what a tyrannous boss and an unblushing corrupter of public life he has been, but, if they do not rise, why should we say anything? We should only make ourselves disagreeable, and accomplish nothing.

Well, all that we say is, if journalism is going to adopt such principles, it will surely fall from its high estate. If there is to be no sense of trusteeship for the public, the public will have to look elsewhere than to the press for a bulwark against fraud and corruption. Since when was it the first duty of a fearless newspaper to be "agreeable"? How can you help being disagreeable to plotters against the common weal? Sir Leslie Stephen says that the world owes much to those who have been bores in a good cause. And what has a newspaper to do with the question of "success" in putting down a rogue against whom it writes? Its duty is done when it tells the truth. In the case of Platt, we are all the while asked, "Do you really think you can beat him?" Frankly, that is a question we have never asked. We know that the honest citizens of the State would beat Platt if they had a chance, and we can only do our part to give them a chance. The expressions of indignation which they have sent to the *Evening Post* are proof enough that Platt is as poor a representative of the party as are those newspapers which sit silent while the base deed is done.

MORAL COERCION IN SETTLING STRIKES.

At the time of the great strike of the iron-workers in 1901, Mr. Charles Francis Adams made some suggestions for the avoidance of such troubles. They deserved more attention than was then paid them. Just now, at all events, every one is anxious to listen to plans having this end in view, provided the plans are rational and practical. Plans for "compulsory arbitration" do not fall into this category. No power exists capable of forcing an employer to pay wages that make his business unprofitable. No court can compel a laborer to work against his will. The labor-unions refuse to be incorporated, for the avowed reason that they do not propose to make themselves subject to legal process. Their employers, they say, can afford to go to law. *They* cannot; and they do not mean to throw away their legal immunity. Their position, whether reasonable or not, makes all talk of compulsory arbitration preposterous.

Mr. Adams's plan contemplates neither arbitration nor legal compulsion. Since he first suggested it, he has reflected on it and taken counsel, and laid it before the Civic Federation, together with the draft of a bill for its application. The plan is such as may be adopted by a State Government or by that of the nation; but the bill takes the form of an act of Congress. Hence it is necessary to limit the act to controversies affecting the mails or the general government, or interstate and foreign commerce. The most important strikes are of this kind. Stated briefly, the bill authorizes the President to investigate any controversy of this description. For that purpose he may appoint a commission not exceeding seven in number. The commission shall have powers in procuring evidence similar to those of the Interstate Commerce Commission, and the parties to the controversy may appear in person and by counsel. After investigation, the commission shall report the facts with recommendations for such action as shall, in their judgment, end the labor quarrel and prevent its recurrence.

The first question asked concerning such a measure will be, is it practical? The answer to this is, *solvitur ambulando*. The plan is now in operation. The commission investigating the coal strike is a commission such as Mr. Adams proposes, except that its powers are even more limited, and that no compensation was originally provided for its members. It cannot administer oaths or compel the production of papers; and, in our judgment, it is on this account all the better as a commission. Mr. Adams's reasoning tends to the same conclusion. It would be a better commission still if it had only three members. Perhaps it would be a counsel of perfection to say that the best commission would consist of a single member; yet we fancy that the public has forgotten that any one besides Judge Gray is now investigating the coal strike, and it will be his opinion that will be generally accepted. The most important law cases are heard by a single judge. In England a single judge can hang a man without appeal; yet few persons competent to form an opinion hold our administration of criminal justice to be better than the English.

When we come to answer the second question concerning the measure—Will it succeed?—we see that everything depends on the moral weight of the judgment of the Commissioners. The "sanction" in the case is public opinion. On this point Mr. Adams reasons with admirable force. His arguments are in line with the progress of civilization. They are illustrated by the growth of international law, by the constitution of the Tribunal of The Hague, by the increase in the amenities of social life, by the improvement in the vast field of morals which lies beyond the reach of legislation. We quote Mr. Adams on the point:

> "It is singular to note, when any controversy arises, how such a method of settlement as that here proposed is at once set aside, as being inadequate and unworthy of consideration because behind it there is no constable's club or soldier's bayonet. In fact, however, the word 'compulsion' has an unpleasant sound to Americans. In theory only is the thing popular. With us the final appeal must always be to reason; and public opinion enforces the edict of that appeal. In every field of legislation this has been again and again illustrated; and yet the appeal to reason, as now here made, is almost invariably contemptuously dismissed from consideration on the ground that there is behind it no force to compel obedience."

To command the support of public opinion—which, when well-informed and rational, exerts a pressure more irresistible than that of policemen or soldiers—everything must be done to increase the moral weight of the judgments of the proposed Commission. Hence every application of force is derogatory. Let the Commission ask, not command, the parties to produce their witnesses, or suffer public shame for their refusal. The very name *subpœna* is incongruous, and the fewer oaths men are compelled to take the better. Moreover, as moral force is relied on, the weight of the Commission would be augmented by whatever increased the disinterestedness of its members. It would be well if their services could be gratuitous. Whenever an office with liberal pay is created, the

politicians seek for it as a pearl of great price. We venture to say that the judgments of a Commission such as Mr. Adams proposes, appointed by the Governor of Pennsylvania, would not be supported by public opinion. The same would be true in some other States, where the emoluments of office are the rewards of party. Furthermore, the judgments of the Commission will be more effective the sooner they are delivered. The great railroad strike of 1877 in Massachusetts occurred on February 12, and the Railroad Commission made a conclusive report on the 21st. For the Coal Strike Commission to waste time—we do not say it has yet done so—is to waste influence.

To place the appointment of an investigating commission in the hands of the President is to fall in with an unfortunate tendency to overload the Executive; but this may be unavoidable in the beginning. Later on, Congress and the Legislature may see their way to shouldering responsibility themselves. But the great thing is to have the matter thoroughly threshed out in public discussion. Mr. Adams has done well to put his plan in the form of a project of law. That should appeal to the practical instinct. And let it not be forgotten that an emergency may arise sooner than any of us think, to make his bill for settling labor troubles by the moral coercion of public investigation a crying necessity.

DR. TEMPLE AND CHANGES IN THE CHURCH.

The death of the Archbishop of Canterbury not only removes a venerable and right English figure, but recalls the extraordinary way in which the ecclesiastical wheel has come full circle during his lifetime. Forty-two years ago any man would have been thought insane who should have predicted that Frederick Temple, Headmaster of Rugby, would die a bishop, much less Primate of the English Church. It would have seemed as impossible for him as for his famous predecessor, equally suspect on theological grounds, Dr. Arnold. Mr. G. W. E. Russell had this old incredulity in mind when he wrote, at the time of Dr. Temple's enthronement at Canterbury, that the event "made clear to the most casual eye the enormous transformation which sixty years have wrought alike in the inner temper and the outward aspect of the Church of England."

It is difficult to understand to-day the alarm into which Church and State in England were thrown in 1860 by the publication of seven modest theological essays. The first name in the volume of 'Essays and Reviews' was that of Dr. Temple, who wrote on "The Education of the World" in a tone that perhaps suggested Lessing, but that reflects only what is the current coin of theological thought to-day. The two men most noted since, associated in the venture, were Jowett and Mark Pattison. They stood for what would be now thought the mildest of mild Liberalism in theology. At the time, however, they seemed to be shaking both altar and throne. Mighty protests went up to the Bishops from all over England, expressing alarm at the "spread of rationalistic and semi-infidel doctrines among the beneficed clergy of the realm." In reply the Archbishops and Bishops said that they could not see how such opinions as those put forward by the authors of 'Essays and Reviews' could be "held consistently with an honest subscription to the formularies of our church," and intimated an ecclesiastical prosecution. Among the Episcopal signers was Thirlwall, who was in print with views fully as heretical, as Stanley did not fail to point out in his indignant article in the *Edinburgh Review*, and Tait, who was at the very time writing privately to Jowett that he saw nothing to object to in either his essay or Temple's. Such is the malign power of ecclesiastical panic!

One reason for the unreasonable excitement was that such a demonstration of Liberalism at Oxford had been wholly unlooked-for. The University, which her well-known son called the "home of lost causes, and forsaken beliefs, and unpopular names, and impossible loyalties," was supposed to be securely tied to Conservatism. Yet there they were, only a score of years after the Tractarians, with Oxford seething with that Liberal spirit which Newman of Oriel and Pusey and Keble had pledged their all to beat down. Pattison once gave a half-cynical explanation of the transformation of Puseyite Oxford of 1840 into the Oxford of 'Essays and Reviews' in 1860. He said it was the natural attitude of the undergraduate to be in a state of chronic rebellion against his tutors. But the student himself became a don in about twenty years, so that you had a cycle of something like forty years for the University opinion in politics and religion to oscillate from one extreme to the other. Thus the Broad-Church latitudinarians of 1860 were the legitimate product of the High Church tractarians of 1840.

Two of the Oxford Essayists were put on trial, but the final judgment of the Privy Council acquitted them in 1864. Yet the whole controversy was fanned into fresh fury when Gladstone appointed Temple Bishop of Exeter, the official announcement being made in 1869. There was a determined opposition to his consecration. Dr. Pusey went so far as to assert that the choice of Temple was "the most frightful enormity that has ever been perpetrated by a Prime Minister." And when, on December 21, 1869, the new bishop was formally consecrated, a High Church paper declared, in that moderate language which theological controversy so often begets, that "on that darkest day in the whole year was perpetrated the darkest crime in the history of the English Church."

To turn from those old bitternesses to the spectacle of an entire church mourning at the bier of its venerated head, is a lesson in Christian tolerance, as well as in some other things. Dr. Temple never recanted; the church did not change its formularies; yet the process of the suns brought the two into harmony, and the heretic of 1860 became the guardian of orthodoxy in 1902. So far as we know, Dr. Temple published little or nothing, in later years, on controverted questions of theology. He was too much overwhelmed with his vast work as an ecclesiastical administrator. Pattison once said that the way to kill a clergyman's mind was to make him a bishop, since "no bishop, ten years after he was consecrated, is ever in touch with the intellectual spirit of his day." Jowett's reason for appointing heretics to bishoprics was that it "keeps 'em out of mischief." But in Temple's case, the polemic and speculative impulse seems to have yielded naturally to the business demands and humanitarian appeals which filled his nights and days, both as Bishop of London and as Primate of England, with heroic and fruitful labors for the good of men.

COUNTERFEIT PRESENTMENTS.

The authenticity of a "Gainsborough" portrait of Benjamin Franklin recently presented to the University of Pennsylvania is now under dispute, and the discussion has brought out the interesting fact that a picture in Lord Lansdowne's London collection, which has been engraved and widely circulated as a likeness of Franklin, is only a portrait of that rather obscure Georgian worthy, Surgeon-General Middleton, who would doubtless have had Poor Richard hanged as a seditious rogue. What has happened in the case of Franklin is very characteristic. Around every great historic character there come to be grouped, besides genuine portraits, many dubious counterfeit presentments—forgeries, ideal heads, and portraits of forgotten persons rashly ascribed to their greater contemporary; and where no genuine likeness has come down, imagination steps in and gives us the invention of some later artist for the actual features of the hero.

Where no authentic likeness has been preserved, one can hardly quarrel with this tendency to visualize a hero who has constantly held the thoughts and hearts of men. It would be futile to protest against the Chinese and Japanese Buddha, for example; idle to seek in the Roman, Byzantine, and mediæval portraiture of Christ anything but the reverent imagining of the Redeemer in the forms

of successive ages. But where genuine portraits exist, the intrusion and acceptance of false likenesses are a positive misfortune. It is seldom that tradition gives so consistent and satisfactory lineaments as it does in the case of Dante, of whom there is no surely contemporary portrait. Often, indeed, there seems to be a kind of pictorial Gresham's Law at work, by which the worse likeness drives out the better. This is certainly the case with Shakspere. The pouular voice has selected as his best representation the so-called Chandos portrait. This picture, all experts agree, was painted some time after Shakspere's death; it is probably an honest delineation, not of an Englishman even, but of "a distinguished foreigner," yet it has, except for the critical, supplanted the hideous Droeshout print, as well as more attractive portraits with a better claim to genuineness.

How such a confusion arises may readily be imagined. The beginning of trouble is the credulous collector who buys an anonymous portrait because it "looks like," say, Milton, or Shakspere, or Cromwell, and gradually passes from hope to conviction on the subject. One may feel a certain tenderness for so amiable an infirmity, but the imputed likeness makes as much trouble for historians as the innocent "attributed to" does for art critics. Another source of error is the historical painter and the creator of imaginary portraits. Both may do a genuine service in expressing an historical memory in terms of flesh and blood, but both do harm when the fictitious likeness obscures any real image of the man.

Strangely enough, this very interesting branch of historical research has lagged behind. The illustrative material of history is handled in a way that, applied to documents, would be cried upon as a scandal. There is, to be sure, a tendency to exclude merely fanciful pictures from serious history, but excellent work is still published in which the absurd illustrations constantly belie the text. That gallery of Kings of Scotland from Macbeth and earlier, which some sixteenth-century dauber imagined for Holyrood Palace, still appear, on occasion, just as William the Conqueror is still acceptably represented by Virtue's eighteenth-century print. What should be a fascinating avocation for a historian has in the past been turned over to publishers' hacks, and the result has been that, while we may have read the past aright, we have unquestionably seen it wrong.

It will be no mean service of the newer and more comprehensive science of archæology if it provides us with a few experts on historical portraiture. The material already is offered in such institutions as the National Portrait Gallery in London and in our historical associations. To-day this branch lies largely in abeyance because few historians have the temperament for the minute analysis upon which this sort of connoisseurship depends, while, except in a few instances, the whole body of limners of historical personages belong to the artistic submerged tenth; hence do not concern the student of art. What we need, in order to keep our vision of Franklin and Shakspere free from surgeons-general and "distinguished foreigners" is a class of experts who will have, on the one hand, something of the connoisseur's delicacy of perception, on the other the laborious and critical habit of the regular historian. For the many students of history who feel that everything worth while has been done, here is a new and interesting field to be rescued from amateurism and conquered for historical science.

THE UNITED IRISH LEAGUE.

DUBLIN, December 13, 1902.

So much has been said of late of the United Irish League—in praise, chiefly in dispraise—that it may be opportune to present in your columns "an Irish-majority" view of that organization. The Land League and Home-Rule phase of Irish politics appeared to have spent itself after the defeat of the Home-Rule Bill by the Lords in 1893 and Mr. Gladstone's retirement from public life. The acclaims of the crowds with which the Lords' decision was hailed in Palace Yard were not answered by counter cheers of defiance, determination, and hope in Ireland. The broken expectations of half a century, the overstrain of thirteen years' acute agitation tending to paralyze the ordinary life of the country, and the bitter antagonisms between Mr. Parnell's former followers, appeared to have taken the political backbone out of Ireland. And this, so different from what England believed would have been her own attitude after the defeat of a measure as ardently desired as was Home Rule by Ireland, no doubt largely contributed to break up the Liberal party and bring the Conservatives back into power. For a while longer the fight was kept up in Ireland, with dwindling support, by Mr. Dillon and three-fourths of the Irish members under the banner of the National Federation, and by Mr. Redmond and the minority under the National League; the efforts of the majority being distracted and hampered by the machinations of some of the ablest of its nominal members, who have since made it plain that they were in reality sick of further contest for effectual reform, and were only anxious to secure such changes as were compatible with following their usual avocations and no longer shutting themselves out from a share of the loaves and fishes of Government patronage. Many who, fifty years previously, had shared O'Connell's hopes, and, after their collapse and his death, had seen Conciliation Hall turned into a corn store and the Library and Collections of the Repeal Association dispersed under the auctioneer's hammer, were now condemned to the humiliation of witnessing the closure of the offices of the National Federation and the National League. Once more, as in Duffy's time, Ireland appeared but "a corpse on a dissecting table." "Never again put trust in a fickle people," was the cry of many who had hoped and striven and sacrificed, and who, nevertheless, again have gathered courag for further effort.

Through and after all, much had been gained. Twenty per cent. reduction had been secured on the rents of Ireland. Thousands of former tenants at will had been put in the way of becoming proprietors of their holdings. "A nation of serfs had been turned into a nation of freemen." The uprising of the Land League had been so formidable that Government and the ascendancy element in Ireland had been forced, as never before, to realize that there was an Irish people to be counted with. Railways were made in remote districts, a Congested Districts Board and a Department of Agriculture were created; and, half a century after its necessity had been fully admitted, a system of county government was established—cramped, it is true, compared to its English prototype as to many of its powers. A greater interest than ever before began to be shown by the upper and middle classes in the welfare of the people. Workhouse and philanthropic reform associations, police-aided clothing and children's protective societies were established. The admission of women as guardians of the poor exercised a beneficial influence on the management of the poor-houses. The complete success of Mr. Gladstone's measure of disestablishment was shown in the dying down of religious animosities, and we had what formerly would have been an anachronism in Ireland—the principal conservative organ (the *Irish Times*) also the mouthpiece of the upper-class Catholics. But the doors were still closed against further land reform; even Mr. T. W. Russell advised the farmers of the north to bid good-bye for the present to hope, and make the best of their state.

It is, however, true of peoples as of individuals, that every "heart knoweth its own bitterness." It was impossible that Ireland could long remain satisfied under present conditions. Depopulation continued. Marshy wastes and stony mountain sides continued crowded with a miserable rack-rented population, while contiguous rich lands, from which their fathers had been driven in famine years, were still given over to cattle ranches and sheep farms. Vital statistics proved that the fibre of the nation was deteriorating. The benefits of recent land legislation could be obtained only through expensive legal procedure, too often only after risky and protracted litigation. The class feeling of the judges in Ireland led to many of the most beneficial provisions of the Land Acts being narrowed in their application. The Sales Court was overburdened with estates held back from disposal by the presiding judge so as not to "bear" the property of his friends the landlords. The Land Courts were upon the whole, by even so ardent a Unionist as Mr. T. W. Russell, stigmatized as "an Augean stable." The laborers had, it is true, benefited by a rise in wages, but the reduction in rents had not made up to the farmers for the fall in prices of agricultural produce. A Government commission instituted to inquire into the financial relations of the countries reported that Ireland was overtaxed to at least £2,500,000 per annum, and although this sum could easily have

been made up to Ireland in other ways than by altering the uniformity of taxation over the United Kingdom, Government made a jest of the report. Not the slightest hope was held out of the old system of Castle government being altered.

Under all these circumstances, it was inevitable that some organized effort should again be made to crystallize Irish feeling, express it in Parliament, and compel attention to Irish wants. For the hundredth time an opportunity was let pass by the "better" and upper classes of society in Ireland to take their natural place as leaders of the people, and show that while they were not prepared to go the length of home rule, they were determined their country's affairs should not be neglected in the Imperial Parliament. But, as ever since the Union, which put them above and beyond the influences of the opinion of the mass of their fellow-countrymen, they held aloof, satisfied in the circles of their own lives. In minor respects they could feel for their fellow-countrymen. To broad requirements they were blind. If the Irish people were not satisfied with general conditions, it was due to their hopeless crassness. If Belfast was satisfied, why should not the rest of Ireland be so? The extent to which Irish society is permeated and influenced by official classes in no way dependent upon the good will of those about them for pay or advancement, is largely explanatory of this state of feeling. If outsiders are inclined to take the opinion of the classes in Ireland that all is well, that agitation is but the outcome of the machinations of interested politicians, they should remember that all previous periods of unrest, culminating in the accomplishment of reforms since acknowledged to be necessary and salutary, have been regarded in like spirit.

The masses and those who sympathized with them had to go forward as best they could. Common sympathy for the Boers, due to whatever cause, had something to do with bringing Irish nationalist parties again together. The election of 1900 found the United Irish League, commenced in the west, fully established in central offices in Dublin, and represented in Parliament by a united party as strong in numbers as that led by Mr. Parnell. The capacity of Irishmen for compromise was shown in the chairman of the Parnellite (the smaller) section being chosen as chairman of the whole, and by the manner in which, since, Mr. Dillon, chairman of the former majority, and his ablest lieutenants, Mr. O'Brien, Mr. Blake, and others, have loyally served under their old antagonist. And this chairman, Mr. Redmond, has fully justified the confidence placed in him. Since then the League has flourished. There are said to be 1,400 branches in Ireland, besides many in Great Britain. If we may judge from accounts published in the papers, one way or another during and since the election of 1900 some £40,000 has been contributed by the Irish in the United Kingdom to its funds, now three in number—one for the expenses of the League itself, one for the support of members in Parliament, another for legal defence.

The League has in a remarkable manner aroused public opinion. Again Ireland is a factor in Parliament. It is due to the League that a Land Bill was introduced by Government last session, that it was withdrawn as inefficient, that a better one is promised. Owing to the League a conference between representatives of the landlords and the tenants is about to take place. The League is a grim necessity. There is not much "sweetness" or "light" about it, although there are few higher-minded men living than many connected with it. But these largely want the support and influence of classes which in Great Britain have helped to steady and dignify politics. The League has to work too often through imperfect instruments. Those who join must subject themselves to the suspicion of approving wild language too common at meetings, and a fictitious atmosphere of connection with crime is spread around its doings, from which political movements of like vehemence in self-governing countries would be free. Language and acts are held as criminal over Ireland which from Orangemen in the north or any party in Great Britain would pass unnoticed; and a microscopical eye is directed to Irish doings. Police notetakers attend all outdoor political gatherings—and most gatherings in Ireland are outdoor; the people are not permitted to use for political purposes the courthouses and other buildings built and maintained at their expense. Trial by jury is dispensed with wherever and whenever the Government desires. Men are tried by Magistrates sent down from the Castle and removable by the Castle; and where it is thought well to submit cases to juries, these are "packed." In a recent instance not only was a special jury secured by Government to try a case, but the jurors were specially selected from a large panel; forty-five being ordered to "stand aside." Apart from the chances of supposed connection with or approval of crime, the dangers of financial ruin are, under recent decisions of the courts, not inconsiderable. Members have, however, the satisfaction of knowing that never perhaps before was Ireland freer from real crime.

Under all the circumstances, however, it requires nerve, a clear sense of right, an overwhelming conception of the political necessities of the country, for quiet people, who would gladly live in good esteem with all men, to take the popular side in Irish politics. For a Protestant it is peculiarly difficult. He must work mainly in conjunction with Catholics, with most of whom, on other than political issues, he cannot have much in common. He is ostracized from much that is sweet in society. He has, however, the consciousness of working with men many of whom he learns to love—men who, while holding firm to their own religious convictions, he realizes are no more desirous of interfering with his beliefs than he is with theirs. He knows he is striving for a people of as innate capacity for advancement and high things as any other—no more prone than other peoples to forget those who have served them or to bear lasting grudges.

It is beside the subject which this letter was written to elucidate, but it is difficult not to note the bearing which recent doings in Parliament may have on the terms of an Irish settlement. If Catholic feeling has been so powerful as to compel the Irish members to take their recent part in Parliament on behalf of Catholics in England, would it permit them to relinquish their continued right of interference in English affairs? And to what extent will English Nonconformists, smarting under the Irish Catholic opposition in Parliament on the education question, be inclined to modify their views as to relinquishing their right of interference in Irish affairs on behalf, it might be, of their co-religionists?

D. B.

AMERICAN WARES IN ITALY.

NAPLES, December 10, 1902.

With the other readers of your columns, I have long enjoyed the letters from time to time written upon the literary and archæological and political conditions of Italy. May I be permitted to call your attention to several points that may be instructive to thinkers upon the commercial future of the United States abroad?

About two years ago I decided to obtain the Italian representation of several large American woodenware manufacturers. This intention sprang from a desire to encounter the ubiquitous German competitor fair in the face, with a firm resolve to find out why Americans could not share, or, at least, hitherto had not been able to share, proportionately in this importation into South European markets. Previous diligent perusal of our consular reports and "Commercial Relations" in Europe had led me to the belief that I had hit upon a fresh field for effort of this kind. Nor was I mistaken. Upon my arrival, somewhat over a year ago, I found that I was the only direct Italian representative of American woodenware in Italy. My equipment for the enterprise consisted in a tolerable speaking knowledge of the language, and in an acquaintance with the ways of the people as well as with their wants gained from a previous sojourn in Naples.

My desire was to sell large orders to wholesalers and to jobbers in the principal business centres of Italy; said orders to be filled direct from the United States. My first surprise came from the discovery that to all intents and purposes the wholesaler did not exist. Something remotely approaching his kind flourished in such cities of the north as Milan. Effort had, therefore, to be turned in the direction of the nearest Italian analogues to the American jobber—namely, the vast tribe of *rappresentanti*. The fact that merchants of every sort refused to consider catalogues in any language other than Italian confirmed the oft expressed, though seldom regarded, warning invariably found scattered throughout consular literature. Even if illustrated, they elicited no interest. At his office in Turin, one important *rappresentante* had a mound of catalogues of divers American hardware manufactures. He begged me to buy for him in New York certain kinds of hardware, full descriptions and illustrations of which for months had been stacked on a neighboring table. Furthermore, he had been provoked by the visit, some weeks before my talk with him, of an English hardware agent who spoke no Italian and unintelligible French.

However, these were trifling difficulties in my path, because I had brought with me illustrated circulars printed in Italian. These gave prices in *lire*, and easy terms of payment that conformed to those readily granted by the Germans with whom I hoped to compete. The serious stumbling-

block that now confronted me was the matter of delivery. Buying in small lots as Italians do, the prices of all the goods were unnaturally though necessarily elevated by reason of the extra cost of freighting in small amounts. Besides this, there was to be met the objection of my prospective Italian buyer in regard to the speed of delivery. Granted that our own were superior in quality to the German goods, the German stood ready to deliver from his bonded stock in less than a week any order great or small. For inland delivery I, on my part, could not promise anything in less time than two months at soonest. And the house whose ice-cream freezers I represented for Italy, wrote me in a disconcerting manner that the factory was so far behind on domestic orders that they could promise me nothing more than samples until some time in 1903.

In order to do business to advantage, it was evidently necessary to have a good-sized stock of all the manufactures represented stored at either Genoa or Naples, or at both these ports. Domestic prosperity had made Americans in general quite loth to put themselves to any risk or expense (of warehousing and so on) for the sake of an export market. Effort on their part could not be enlisted farther East than New York or Boston. Certain large commission houses with offices at New York, London, and in Germany bought in America orders of considerable amount, carried them to Germany, and thence dispersed their contents in small lots over Italy. In order to lessen the expense for each of my houses, I proposed that each should contribute enough to pay for the storage of a common stock to be placed in bond at Naples. The suggestion was quite fair, as there were no competing goods to be put together. The idea was discountenanced as hazardous; and a proposition to set up an American hardware and woodenware store where goods could be sold at both wholesale and retail, met with refusal. And this was notwithstanding the fact that the best local advice indicated that an undertaking of this kind could easily have been begun with a small initial outlay, and that it would have proved to be a profitable novelty, likely to sell the goods at rates below those offered by *rappresentanti* whose per cent. of profit, plus that of the people through whose various hands the goods had already passed, would be clearly saved by the complete elimination of middlemen.

It took no extensive research to show why the Germans who were in Southern Italy were introducing woodenware and hardware with practically no competition from without. The reasons for this situation are few and simple. With their proverbial insight, the Germans approached the question of export trade with the philosophy that has won them so high a position in purely intellectual realms. In Italy they have overcome opposition both by accident and by design. As the whole world knows, for some years, Germany has been in the throes of an industrial crisis. To avert disaster and possible outbreaks among the hordes that constitute the operative class, it has been found expedient to keep the factories productive at any risk short of actual loss. As a result of the domestic market being overstocked, goods are turned out and sold to the export trade at the merest trifle above actual cost of production. How has an outside demand been built up? For one thing, the consular service attained its present highly efficient development by reason of the need of a continual outlet for German products. Each consulate is obliged to turn into the chief bureau at Berlin (the statistics of which are always accessible to German manufacturers) accurate reports and tables. The former describe the general market conditions of the consular district in question, and state what products can be imported at a profit from Germany (and, also, exported to Germany). The tables present detailed information as to the means of access and the cost thereof. They also give the local *octroi* (where such exists), as well as the cost of delivery of goods to the market; and, finally, prevailing quotations on those lines that may be of inter est to the prospective German exporter.

The German manufacturer consults the statistics that are ever at his disposal, and sends one or more representatives into the district he proposes to invade, armed with a copious supply of samples for distribution, and power to make the best terms possible. The representative will ask the local buyers what they are willing to pay for certain articles; and he can usually agree to deliver any desired order on terms of ninety days or more, or with a small per cent discount, for cash in thirty days. These articles once introduced, a stock is afterwards kept so that at short notice orders can be refilled. So scrupulously painstaking are the Germans that no conciliatory effort is omitted to urge their wares upon the export market. For example, I saw the other day some German wall-paper that, on the back, had a legend printed in six languages informing one of its washable qualities. More than this, in order to draw the eye to the words themselves, there was a large and strikingly quaint design of gnomes wandering over the surface between the print. This insistent fondness for pandering to the fancy of any one who may become a buyer, is further illustrated by a still more classic example. It is well known that at one time England and Germany were competitors in selling sewing needles in the Chinese market. The English needles were sold in the customary black wrappers. An ancient superstitious dread of black shifted the Chinese needle trade to the Germans, who presented their inferior product wrapped in red paper of good omen. British conservatism or stolid indifference to pampering such whims as this (which proved, at least in this one case, a matter of crucial importance) cost dear. English and American manufacturers have very much the following attitude toward foreign buyers: "If you are not satisfied with what I have to sell, better go elsewhere." And elsewhere they often go. This independent and dictatorial manner is of small moment in times of vast domestic demand for home manufactures, but it never makes for commercial expansion, since the successful competitor abroad finds pliancy in its widest sense the most imperative consideration.

Meanwhile, the American manufacturer has probably not done more than to sell orders at New York to Germans who resell at a profit, which might be saved by employing a representative equipped with a knowledge of Italian, abundant samples, power to give long credits where it would be safe to do so, and illustrated circulars in Italian. Or, perhaps, he has opened an agency (with a small stock) in London. In this case, at least two profits unnecessarily intervene between American manufacturer and Italian consumer. At most, let us say, he has sent a representative over to Italy to look after his interests. But this unfortunate has his hands tied. He is obliged to submit to the indignity of having a successful German rival step in under his nose and take the market out of his hands because his power is limited. He cannot extend credits. He must await advices from headquarters about trifling details to which he could better attend on the ground. His superiors are naturally annoyed at the pettiness of questions they cannot understandingly answer, questions upon the instantaneous reply to which may depend important orders; and with which, once and for all, the representative should have been authorized to deal.

From the above strictures upon American obtuseness in matters of export, the managers of the Singer sewing machine, the Remington typewriter, and the National cash register are exempt. Their successful introduction is national. From Palermo to Turin their progress has been rapid far beyond that of any other American manufactures. How was this brought about? Superiority of the article itself, compliance with all the demands made by the Italian consumer that are met by the Germans, and, lastly, by extensive advertising. It is probably not too much to say that Italians advertise as much in proportion to the amount of capital invested as we do at home. These three machines are everywhere advertised in journals and by posters. A few Americans, very few as yet, have followed this encouraging example.

A carefully planned and logically conducted assault on the present German supremacy in woodenware and hardware, for example, would make a comparatively important place for America in southern Italy. The attack must be carried on along the lines followed by those now holding the field, or in another way that could hardly fail of a sudden success. So little Neapolitan capital is invested in industries of any sort that a large American department store at Naples, in which nothing could be bought that was not of American origin, would succeed from the hour of its inception. There should be a direct delivery of goods from the American manufactory to the store at the lowest export rates. This plan would obviate the various middle profits that at present are holding us back in this region where "English" and "American" are in themselves advertisements of no little value. This saving would be so considerable that the Germans could be met victoriously with goods superior to their own, at as low or lower prices than those at which they now find themselves practically without competition. A store such as I have in mind, such as several times has been suggested to me by people cognizant of the possibilities here for American enterprise properly directed, ought to include a varied assortment of commodities. For instance, there need be no clash in an "emporium" of this kind between dry goods and optical goods, between shoes and woodenware, between groceries and drugs,

provided that no conflict of interests should be permitted to occur, and that each department be by itself in charge of a responsible director. Shop rents in choice situations are low beyond belief. Before many months the establishment could count on a much larger *clientèle* than that of tourists, resident English, and modernized Neapolitans. Its sales would extend outside of Naples into central and northern Italy.

RAPPRESENTANTE.

Correspondence.

CHANNING'S VERSE.

TO THE EDITOR OF THE NATION:

SIR: Noticing in a recent issue of your journal the citation, from Channing's 'Poems of Sixty-Five Years,' of that impressive meditation of his entitled "To-morrow," it has occurred to me to send you the first form of it, as he sent it in a letter to Emerson from New York, where, at the age of twenty-six, he was aiding Horace Greeley in editing the *Tribune*. In copying the verses for publication from the printed volume of 1847, it escaped my notice that I had them in a fuller form, but with variations, in this letter. It came back to Channing, with other letters to Emerson, after 1882, and was left to me with the mass of his manuscripts at his own death a year ago. He gave the poem no title, and omitted three lines in printing it. The thought, though profound, is obscure, like much that poets have to say about that mysterious entity, Time—"the wild Time," as Emerson says.

F. B. SANBORN.

CONCORD, MASS., December 23, 1902.

NEW YORK, Feb. 9, 1845.

MY DEAR FRIEND:

I got and was glad to get your letter to-night. I thought, not that you had forgotten me, but that you had forgot to write. It is dated Feb. 1, and is a nine days' wonder.

I have nothing to say; it is for this reason that I write. Had I anything to communicate I should be perfectly silent. Not only have I nothing to say, but I cannot imagine how any one ever had. At remote distances from where I am, some faint possibilities of life in a shaded background seem to arise.

Fled, O fled forever! are you, early and mysterious lights, that around the initials of existence once in rosy beauty played: gone, gone, there where all things fine and fair fleetly go!

Thus, O thou man of marble security! do *I* write, the child of impulse, the creature of imagination, and the ghost of the past. Thou, cased in triple steel, needest not confessions, desirest not sympathies. It is better where thou standest than where I conflict with the shadows running swiftly over the wide, bare, deserted and misty plain—its only music the very distant, sullen dashing of some sea bitter in its waves, or now the dull sough of a weary wind that here has come to die in the long strands of sere grasses. W. E. C.

I send you, you patron of the poor! the only verses I have written this winter.

TO MY WIFE.

And thou, who art the life of this world's light,
Fair flower that sweet suns nurtured into bloom!
From thee I urge no more the weary flight,
Thy image kindly sits within the room,
And softly smiling bans the veiled doom.
. . . . . .
To-morrow comes, alas! my friend, to-morrow—
There down below the pines the sunset flings,
Long arching o'er, its lines of ruddy light,
And the wind whispers little harmonies,
And underneath their wings the tender birds
Droop the averted head—silent their songs.
Yet not a word whispers the moaning wind,
Nor when the primal stars, in faint array,
Trail with the banners of the unfurled night;
Nor even when the low-hung moon just glints,
And faintly with few touches seres the wood.
Not then, nor there, doth Nature idly say,
Nor whisper idly of another day:
That other morn to its own morrow is,
That other day shall see no shade of this—
Being forever morrow where the hand
Omnipotent the shadow parts, and time,
Circling in gayest measure, rounds the print.

A "STRENUOUS" KING OF ENGLAND.

TO THE EDITOR OF THE NATION:

In these days of a "strenuous" President, it is interesting to note the "strenuous" King of England who first gained that title. Bishop Stubbs, in his 'Introductions to the Rolls Series,' recently reprinted, says that King Richard

"had the rare prerogative of true genius, to be able to see the best plan of operations [in war] to be the best, even when it did not proceed from his own brain. He was circumspect to design and swift in execution, ready to seek and to take the best advice, to yield his own schemes and accept a subordinate position when the decision of the majority was against him. Skilful as he was in the designing and earnest in the execution of military combinations, he was the veriest tyro in politics."

Bishop Stubbs cites in his notes Bohadin, who says of him: "The King of England—strenuous before all," and Giraldus, "Strenuitas et magnitudo fere pars"; Gervase of Tilbury, "In strenuitate, magnanimitate, militia, scientia, et omnis generis virtutibus nulli secundus"; Chronicle of Tours, "Vir armis strenuissimus et a populo honoratus."

At another place (p. 314), Bishop Stubbs says of him: "His eloquence, such as it was, may have come to him with his troubadour tastes from his mother, and his indomitable pride, and his carelessness of expressing his contempt for those he felt beneath him in strength or fame." And at page 321, "His political alliances were formed on the merest grounds of likes and dislikes; he was eloquent after a rude and effective fashion, consciously unfit to govern men—he did his best to choose good ministers—and utter want of political common sense prevented him from being a good ruler."

In these days of historic parallels, it might be suggested that Richard the Lion-hearted, as described by Bishop Stubbs and the early authorities quoted by him, was in some sort the prototype of our own strenuous President. At all events, it is curious and interesting to find such a picture in the grave and well-weighed pages of so good an historian as Bishop Stubbs, of the great English King, with some features so like those of the modern President. R.

"MALAHACK" ONCE MORE.

TO THE EDITOR OF THE NATION:

SIR: In Volume 73 of your esteemed weekly a great deal of discussion is to be found on the word "malahack" (see pp. 148, 205, 245, 264, 377, 413), but none of your correspondents had found it in a dictionary or traced its origin. I met the word by chance in John S. Farmer's Dictionary, 'Americanisms, Old and New: A Dictionary of Words, Phrases, and Colloquialisms Peculiar to the United States, British America, the West Indies' (London, 1889). At page 356 "malahack" is explained thus: "To cut up hastily or awkwardly. This is an *English* provincialism, which, however, is colloquial in America." But more is said in the fourth volume of the famous Oxford work of Prof. Joseph Wright, 'The English Dialect Dictionary' (1902): "*Malahack*, verbum, East Anglia. (1) To cut or carve in a slovenly, awkward way. Cf. *molly-hawk*. Norfolk, Suffolk. (2) Of a horse or donkey: to become disabled or worn out by hard work. East Suffolk." Under "*Molly-hawk*," p. 148, occurs the entry: "Norfolk. A heavy double-toothed mattock."

"Malahack," therefore, is in every-day use in Norfolk and Suffolk, and appears not to be found outside "East Anglia." As your correspondents from Maine to Virginia prove, it is also common especially in the districts peopled by early emigrants from "East Anglia." No doubt, the word came from there to America, not *vice versa*. Whether the etymology from *mal* (French) and *hack* (English), "to hack badly," as mentioned somewhere, is correct, I cannot decide.

The word *mallack* mentioned by one of your correspondents (p. 377) is, according to Wright's Dictionary (vol. iv., p. 40), one of the many forms of the word *marlock*, which means, as substantive: "a prank, frolic, 'lark'; a trick, practical joke; a noisy disturbance, an uproar, 'row'; an unfortunate accident; one who plays pranks, a fool"; as verb: "to play; of a horse: to be restive, kick," etc. Other forms of the word *marlock* are "*maalack, mailack, mailock, mairlock, malech, malek, marlak, marluk, morlock*," etc.

I may mention that I have not found the word "malahack" in slang dictionaries such as James Maitland's (1891) or Albert Barrère and Charles G. Leland's (1897).

Yours truly, A. B. MEYER.

DRESDEN, ROYAL MUSEUM, December 14, 1902.

Notes.

The Arthur H. Clark Co., Cleveland, O., announce in a limited edition an important historical series entitled 'The Philippine Islands, 1493-1803: Explorations by Early Navigators, descriptions of the Islands and their Peoples, their History, and Records of the Catholic Missions, as related in contemporaneous books and manuscripts, showing the political, economic, commercial, and religious conditions of those Islands from their earliest relations with European Nations to the beginning of the nineteenth century,' in fifty-five volumes, the first of which will appear about January 15, 1903. This work will present (mainly in English translations) the most important printed works, to the year 1803, including a great number of heretofore unpublished MSS., which have been gathered from various foreign archives and libraries, principally from Spain, Portugal, France, England, Italy, Mexico, Japan, the Philippines, etc. The series will be edited and annotated by Miss Emma Helen Blair, A.M., of the State Historical Society of Wisconsin, assistant editor of 'The Jesuit Relations and Allied Documents,' and James Alexander Robertson, Ph.B., also formerly engaged upon that work. An historical introduction and notes will be furnished by Prof. Edward Gaylord Bourne of Yale. The series will include a very extensive bibliography of "Philippina," surpassing any that has yet appeared. There will also be an exhaustive analytical index to the complete series, and numerous facsimile illustrations, maps, etc. One thousand numbered sets is the limit of the edition.

The handsome typography of Charles Lamb's 'Adventures of Ulysses,' brought out for the holidays by R. H. Russell, is its chief recommendation as a reprint of a classic. Full-page tinted illustrations, by M. H.

Squire and E. Mars, it does not lack, but of hardly any of these can it be said that they are real designs, or more than decoration. They make the story a picture-book for the young, and these at least will seek no further.

The same publisher hands us a small folio in humorous vein, 'A Dog-Day,' the diary by Walter Emanuel, the chalk and crayon plates by Cecil Aldin—from the French. Old folks can enjoy it once; babes will return to it as often as the mother makes up a text of her own for this dog's adventures.

The story of St. George and the Dragon, in Burne-Jones's designs and an old English ballad, has been attractively presented by Mr. Russell on a scroll that might, if need be, be tacked to a wall, though it is on rollers. The scenes are rather faintly reproduced, as if at second or third hand.

Messrs. Dent's 'Don Quixote,' pretty in all externals as Dent books always are, is intended for unfortunate youth—unfortunate as not being thought worthy of a complete edition. We can do very fairly without "The Curious Impertinent," and even with an abridgment of the "Story of the Captive," but to cut out the disquisitions on knight-errantry, the classics, the drama, and so on, because they are supposed not to interest "youth," should be criminal, and is stupid. Then, to praise the book thus transmogrified for "its healthy fun and frolic" is most precisely to add insult to injury. The text is the always readable vulgate of Jarvis, and the illustrations are by W. H. Robinson. As to these, we should have rejoiced more over the old set of Tony Johannot.

It is hard to imagine to what wealth of language and prodigality of capitals FitzGerald would have been moved had he reached Mr. C. H. A. Bjerregaard's 'Sufi Interpretation of the Quatrains of Omar Khayyam and FitzGerald' (J. F. Taylor & Co.). The position of the commentator seems to be that, in some mysterious way, not only Omar but FitzGerald wrote Sufism without knowing it, like M. Jourdain and his prose. This inner meaning is now extracted in a most sumptuously printed but undeniably dull exposition, the principal value of which is that it illustrates so beautifully how sane men could once believe in the double meaning of Scripture. As to Omar, most are agreed that he was no Sufi, but a philosophical sceptic, who sought refuge from time to time in a theological "perhaps." And as to FitzGerald, Sufism in Omar was his pet bogy. He even, it may be, made Omar more of an unbeliever than he was. Mr. Bjerregaard and all good occidental Sufis have now their revenge by making FitzGerald one of themselves *malgré lui*. But if a man does not himself know what he is writing, and his word cannot stand for the faith that is in him, where—with permission—"are we at"? On the side of scholarship, this book, in spite of protests, raises grave doubts as to Mr. Bjerregaard's first-hand knowledge of Sufism. Certainly no one who had such knowledge would class together al-Ghazzali and Jalal ad-Din ar-Rumi. As well confuse Hegelians of the right and of the left.

The 'Cambridge Bible for Schools and Colleges' would not ordinarily find notice here, but a new commentary on the 'Song of Songs' is of some even literary importance. Principal Andrew Harper has in this case (Cambridge, Eng., University Press; New York: Macmillan) produced a really suggestive little book, although it is improbable that his view as a whole will meet with much support. It is practically Ewald's hypothesis cast into lyric rather than dramatic form. In its defence is suggested the parallel of such dramatic lyrics in varying metre as make up Browning's 'James Lee's Wife' and 'In a Gondola.' This is undoubtedly valid so far as the separate songs or soliloquies are concerned. Browning's dramatic lyric is the nearest parallel we have to the very essence of all Semitic poetry. But the combined whole cannot thus be explained; Semitic poetry knows no such elaborate structure. Throughout, Principal Harper vainly kicks against the pricks of Budde's hypothesis, and finally exhausts his ingenuity on it in a twenty-page appendix. The fixed use of the Authorized Version as text in this series is here reduced to an absurdity by the printing of a new translation separately.

The long series of the Dent-Lippincott charming little volumes, "The Temple Bible," has now been closed by an 'Introduction to the Study of the Scriptures,' by the Bishop of Ripon. As the volumes have separate editors, their general merit of course varies, but the plan of literary introduction, clearly arranged text, simple notes, and lists of references in English literature is admirable, and has inspired to lucidity some most learned theologians. As we cease to read the Bible in one way, we may perhaps, by grace (partly) of books like this, come to read it in another. That the other way shall still be essentially religious is the care of the Bishop of Ripon's little introduction. It, too, is simple, direct, and telling.

Mr. J. N. Larned's 'Literature of American History,' noticed in our last volume, made a few incursions into 1900 and 1901, but its 4,145 numbers were otherwise retrospective up to the last year of the last century. The work is now continued for 1900-01 in a thin 'Supplement' of less than forty pages (Boston: Houghton, Mifflin & Co.) "on lines laid down by the parent volume," and yet with a difference. Mr. Philip P. Wells of Yale appears as editor in charge, and his all but uniform practice is to cite, often freely and again condensing, some authoritative review, giving the writer's name where it is known. Very serviceably, also, mention is occasionally made of controversy over the work in question, as in the case of Prof. E. G. Bourne's 'Essays in Historical Criticism' or of the Durham Report. The numbering is continuous with the elder volume, and the concluding title is No. 4333. On the whole, this seems to us a safer mode of procedure than that of express and first-hand collaboration in appreciation. The longer extracts not infrequently convey a satisfactory impression of the weight of judgment even when anonymous.

We are glad to receive the sixth edition of Clegg's useful little 'International Directory of Booksellers and Bibliophile's Manual; including Lists of the Public Libraries of the World, Publishers, Book Collectors, Learned Societies, and Institutions, Universities, and Colleges; also, Bibliographies of Book and Library Catalogues, Concordances, Bookplates, etc., etc.' (Rochdale, Eng.: James Clegg; New York: Dodd, Mead & Co.). It is three years since the fifth edition appeared. No material change has been made in the scheme, and the editor still strives to keep the work of a handy size. The title does not exhaust the variety of information here packed conveniently away.

With volume iii. is concluded the 'History of Enfield, Conn.,' edited and published by Francis Olcott Allen at Lancaster, Pa. This remarkable work embodies in permanent form all that pertains to the planting and growth of a Connecticut town. Careful explanatory notes add much to the value of the record. Volumes of history might be evolved from the lists of soldiers sent out from Enfield to the several colonial wars, with specific detail of the object of each expedition, and in some instances of its result. Other phases of colonial life are clearly brought out and illustrated. The records of death and graveyard inscriptions are conspicuously minute and indigenous. Enfield may well take pride in this exhaustively comprehensive history, testifying as it does to the love and loyalty of a descendant of one of its early settlers—Moses Allen—the ancestor also of the Revs. Thomas and William Allen, Gen. Ethan Allen, and many other worthies.

In a little volume entitled 'Hugh Price Hughes as We Knew Him' (London: Horace Marshall & Son) are collected several interesting reminiscences of a distinguished English Nonconformist minister, whose recent death is described by one of the contributors, the Dean of Westminster, as a loss to "the cause of national righteousness." These brief papers are a remarkable evidence of the impression made by Mr. Hughes upon his fellow-workers in the various fields of church work, social reform, and journalism. All his associates speak with amazement of his untiring energy. One of his volumes of sermons, for example, for which a publisher had long been clamoring, was dictated to his private secretary in two days. Even more significant was his disinterestedness. He refused to take from the West London Mission a salary of more than $1,500 a year, with the use of a furnished house; and during the last year of his life, having received a small legacy, he returned the whole of his stipend to the mission, and in addition contributed $500 to the Methodist Twentieth Century Fund. As Mr. F. A. Atkins says, "He might have made ten thousand [pounds] a year as a barrister, but he preferred to be a Methodist preacher with the salary of a managing clerk."

The fact that the attention of students in other parts of the world is specially directed toward English institutions, by the Rhodes scholarships or whatever else, makes Gilbert C. Bourne's 'Introduction to the Study of the Comparative Anatomy of Animals—Vol. II., The Cœlomate Metazoa' (London: George Bell & Sons; New York: Macmillan) a very timely publication. The author's selections of types of animal organization for dissection, description, and comparison have been determined by the requirements of students reading for the preliminary and intermediate science examinations in the universities of Great Britain; yet the work is quite as well adapted to the needs of students and teachers in foreign countries as in England. As will be seen from the list, the chosen types have close allies in nearly all parts of the earth, and the slight differences that exist only add interest to comparison. A good deal of the work is embryological, and in embryos

the minor differences are less likely to appear than in adult forms. The types include the liver fluke (Distomum), the worms Lumbricus and Polygordius, the molluscs Anodonta and Helix, the crustacea Apus and Astacus, the insect Periplaneta, the lancelet Branchiostoma (here named Amphioxus), the shark Scylliorhinus (here named Scyllium), the frog Rana, and the mammal Homo. The nuclei of definitions are prominently indicated in bold-face type. In most cases the specific name of the type under dissection is given; an exception appears to be made in the case of "the frog." Some of the names are antiquated. Opportunities for criticism in regard to treatment, thoroughness, and accuracy are comparatively few. It is a pleasure to deal with a work of so much excellence.

'Clinical Psychiatry,' adapted from the German of Kraeplin by Dr. A. Ross Defendorf, a lecturer at Yale, is published by Macmillan Co. as a text-book for students and physicians. It does not seem particularly adapted to such use, for the style is not fluent and the directions for treatment are not particularly satisfactory. We should be disposed to put it in the library for occasional consultation in confirmation or disproof of deductions from observed mental phenomena.

England's new King and Queen and President Roosevelt are in the select portrait gallery of the new issue of the *Almanach de Gotha*, its 140th (Gotha: Perthes; New York: Lemcke & Buechner). The editor conceals his reluctance to drop the Transvaal and the Orange Free States forever from view, but notes their disappearance and hails the swimming of free Cuba into his ken. His official perplexities have arisen, he says, from unprecedented changes in the diplomatic service. Cabinet changes have been perhaps fewer than usual. In all civilized nations there has been a rejuvenating of the high military commands. By courteous exception, the *Almanach* gratifies a request of the Swedish Minister of Foreign Affairs in admitting to the appendix a brief account of the Nobel Foundation, with the personnel of the committees.

The desideratum in the Harvard University Catalogue which we have long expressed, viz., a page reference for instructors' names in the index, is, we are glad to observe, supplied in the new issue for 1902-03. One who wishes to learn the rank and chair of a member of the teaching corps, for example, is no longer obliged to search through the entire list of "officers of instruction and administration," arranged, not alphabetically, but "on the basis of collegiate seniority."

The nineteenth annual report of the American Bureau of Ethnology opens with an extended administrative report by the late Col. Powell. To this document he appended a short outline of "Esthetology, or the Science of Activities designed to give Pleasure." This is a treatment of the games, art, music, drama, etc., by which savages attempt to render their tedious lives more agreeable. The papers accompanying the report are of rare value, and largely from the hands of specialists regularly connected with the Bureau. Of these the Myths of the Cherokee, by James Mooney, is noteworthy, embellished as it is by a careful study of the historical setting of the racial contact of Cherokee and European. Three papers are given to the Puebloan Tusayans, one to the mounds of Northern Honduras, and three to numbers and calendar-systems. Of the latter, "Primitive Numbers," by W. J. McGee, offers data for important generalizations. "The Wild Rice Gatherers of the Upper Lakes," by A. E. Jenks, is a valuable study in culture-history. The printing and the plates of these two volumes are, as usual, of a high class; but the plate-work suffers in comparison with that of several years ago, specially when in color.

The 'Handelsatlas' of A. Scobel (Leipzig) is one of the most satisfactory aids to the teaching of commercial geography that have come under our notice. The maps are all in color, and the shades are, fortunately, so arranged as to lend themselves with comparatively little difficulty to reproduction in lantern-slides. The author has selected accurate forms of base maps, and has refrained, with few exceptions, from overloading them. His charts represent the distribution of all the most important articles of commerce—metals, minerals, and commercial flora and fauna—in great detail. These maps tell their story almost at a glance, and are well designed to aid the younger student as well as the more mature. Besides the distribution of products, the regular trade-routes, ancient and modern, are well represented; and the density of population and prevalent occupations are likewise indicated. Detail maps of all the important harbors of the world form a valuable feature; and ancient and modern colonial geography comes in for some attention. The map which represents the colonies of the Phœnicians, Carthaginians, and Greeks, together with the extent of the Roman Empire, is especially convenient, and that which shows the extent of the Hanse puts a great deal of detail in compact form. The Atlas is cheap in price.

Among the historical manuscripts published in the December Bulletin of the Boston Public Library is a letter from Boston, dated July 20, 1779, in which a reference to the possible capture of the city by the British closes with the remark that "half of the people wish their coming." Possibly this Tory leaning had much to do with the refusal to believe the news of the taking of Stony Point. "We have just recd an Account from Genl Gates of the Reduction of a fort on the north river, but the people know the credulous disposition of the Genl so well that they place no confidence in any Account he may transmit hither." In a letter dated "Park of Artillery near Morris-Town, March 19th, 1780," some details are given of the dispute between the officers and soldiers of the Pennsylvania Line, "respecting the inlistments of the latter, many of whom contend they were listed but for three years while their Officers insist on their being inlisted during the War. This dispute caused such frequent desertions while those troops were on Command on the Lines, that it was thought expedient to man the Line with the Troops from Connecticut alone."

The new Chinese tariff, which went into effect October 31, is published in the Consular Reports for December, together with the agreement between the special commissioners of the United States and of China. Consul-General Mason of Berlin describes the German processes and machinery for briquette manufacture. There is a picture of a machine "by which black dense briquettes of high caloric value are made from peat without the application of heat—simply through the action of kneading and drying." Other German industries treated are uralite, a new fireproof material, and quartizol, "a cheap, strong, fire- and water-proof brick made of fine clean quartz sand and some chemical admixture." Of peculiar interest is the prospectus of a proposed international peace exhibition of South Africa to be held at Johannesburg in 1904-05.

The principal article in the *Geographical Journal* for December is Dr. M. A. Stein's report of a journey in Chinese Turkestan, his special aim being to examine some of the ancient ruins seen by Sven Hedin and other travellers. It was made under the direction of the Indian Government, and was the first attempt to explore this region from an archæological point of view. He visited the sites of several towns which have been submerged by what the natives term the "great sand ocean," and found numerous remains dating back to the second century of our era. Among these were statues, stucco images, rilievos, frescoes, ornamental wood-carving, and coins. Orchards and gardens could be traced, and in one place a row of fallen poplars was discovered. The most important finds were several hundred wood tablets, the great majority of which were written in an Indian language. Some were in a non-Indian language, but written in Indian characters, and may prove to be an indigenous tongue spoken by the people of that period. When they are deciphered, it is hoped that they will throw light upon a lost chapter of Central Asian history. In his notes of a trip through Uganda, Sir C. Eliot recommends the use of automobiles for the transport of goods—an experiment which has been successfully tried in the Congo Free State. Capt. R. Amundsen describes his proposed expedition to determine the position of the North Magnetic Pole. He hopes to start in May, 1903, with eight companions and return by way of Bering Straits in the summer of 1907.

It is significant of the progress of Japan in scientific knowledge that the leading place in *Petermann's Mitteilungen*, No. 11, should be given to a morphologic study of the Selouchi or Inland Sea by Dr. N. Yamasaki of Tokyo. After briefly adverting to the important place which the sea has occupied in the history and industries of the nation, he describes the topography of its shores and numerous islands, its geologic history, the peculiar features of its bottom, and the changes which are taking place mainly through erosion. Hauptmann W. Stavenhagen gives another instalment of his review of Russian cartography, past and present.

—Truth is no longer in a well. From the Esoteric Centre of Washington she has come out, and even now, but sexless and pure, in the astrality of the Occultist, Dr. A. de Sarâk, Count of Das, she is radiating forth, "forward, ever forward," even to Boston, "dissipating darkness" by luminous lies and "proclaiming peace" with a steady flagellation of her dearest foes, the Theosophists. Great was Blavatsky, the Russian spy who succumbed to the influence of the most notoriously ignorant quack of India; but greater still is the astrality of the Count of Das, who will "hatch out a

bird or a fish in the space of a few minutes," and can thus (for in the persuasive words of his review, "this is logic") prove his title to be an Adept superior to the "poor old gentleman, proud of his title," at the head of the Theosophists. All this we learn from a rapt perusal of the first number of the first volume of the *Radiant Truth*, managed by Miss S. L. Lee, late a Theosophist, but now a successful scorner of that heresy, and edited by the glorious Count himself, who spells Krishna as Christna (as if Christ could be thought to derive from India!); attributes to the Vedas ideas utterly foreign to them; cites from Manu verses not found in Manu; and cheerfully endorses the claims of one Jontin, an extant alchemist, who can "manufacture the diamond, gold, and the elixir of life." But this is not all. The *Radiant Truth* publishes Occult *secrets*, and, that all may test the truth of the *Truth*, it even prophesies. Who would not be inspired? Hear, all ye poets and clergymen: "To facilitate inspiration, breathe from time to time the perfume of the leaves of the Lemon Verbena plant. It is good to carry about the person three leaves of the Lemon Verbena, gathered on a Sunday, three hours after sunrise." And this is the twentieth century! As to the prophecies which are to substantiate beyond cavil of the Theosophist the claims of the Occultist, only one is vouchsafed to us by the astral Count in this first number of his *Radiant Truth:* "Our review will meet with the greatest success."

—There is little to edify in the Poe-Chivers papers, an instalment of which appears in the January *Century*, with editorial introduction and comment by Professor Woodberry. Some may be interested to learn that Poe's temperament was bilious, nervous, sanguineous, but, upon first view, appeared to be bilious, sanguineous, nervous; or that he was "the Incarnation of the Greek Prometheus, chained to the Mount Caucasus of demi-civilized Humanity, with the black Vulture of Envy feeding on his self-replenished heart"; or that Tennyson's poems are "as effeminate as a phlegmatic fat baby"; or that Lowell's Rosaline was "as palpable a plagiarism as was ever palmed off by arrogant mental mediocrity upon a too credulous Public"; but unless the limitations of Dr. Chivers are themselves of importance, no important interest has suffered by the long slumber of his opinions. A final instalment is to follow in February. The "so-called" Sugar Trust (since they are all so called, why not consult brevity and call them so?) is considered by Franklin Clarkin, with somewhat fewer details of management than have characterized the previous articles of the series. Albert Shaw writes of the President and the Trusts, censuring the managers of these organizations for their reluctance to accept the policy of publicity and governmental regulation for which the President has declared. The editor pleads earnestly and thoughtfully, as he has often pleaded before, for the status of friendship between labor and capital, rather than the status of warfare so generally maintained at present.

—Benjamin Kidd, still harping on my daughter, contributes to the January *Harper's* a further presentation of his theory of "projected efficiency," whereby he seeks to reconcile the facts of social life and progress with the doctrine of the survival of the fittest as it is held in respect of the lower realms of life. In the earlier stages of human existence, immediate efficiency was the price of survival; as the races have advanced, the successful candidate has more and more become that race which carries not only those qualities necessary to efficiency in the present, but also the burden of qualities which will contribute to a higher efficiency in the future. Natural Selection is at work, therefore, among human kind as elsewhere, but in this field her discriminations are now based not so much upon present fitness as upon "the degree of efficiency of the subordination of the present to the future." Wu Ting-fang writes interestingly, as always, of Chinese and Western civilization. If it were not for the mistaken fear of recognizing anything commendable in a non-Christian civilization, the mission of such a man as Wu Ting-fang might have done an immeasurable amount of good in establishing a basis for mutual respect and understanding between China and the United States; and no thoughtful and unprejudiced person can doubt that the reception of the fundamental principles of Christianity in China would be much more rapid under such conditions than it has been in the past. James B. Connolly writes a vivid description of Arctic whaling, as it is carried on to-day, but it is impossible to get the real spirit of adventure into a chase that ends by shooting an explosive bomb into the whale with a mechanically operated gun. Professor Kittredge, of Harvard, illustrates briefly the current growth of language by the formation of new words, counselling, with Horace and so many others, a mean between the unyielding purist and the reckless innovator.

—The November number of the Annals of the American Academy of Political and Social Science contains a study, by F. R. Fairchild of Yale University, of the financing of the South African war. A detailed history of the financial operations of the war is followed by sections devoted to a more general discussion of the war taxes and the Government borrowing, and to a summary of the cost of the war and the means by which it has been met. The total cost of the war, covering only actual expenditure during the four years of war (the official estimates being used for the year 1902-3), is computed at £212,609,000, being made up of the three items—supply services, £196,657,000; interest on loans, £9,367,000; discounts on loans, £6,585,000. This expenditure has been met as follows: by suspending the sinking fund, £9,228,000: by taxation, £53,208,000; by borrowing, £150,173,000. Of the additional taxation levied to meet war expenditure, the most important measures are the import duty on sugar and the export duty on coal, enacted in 1901, and the import duty on corn and flour, enacted in 1902; this last particularly interesting, in view of Great Britain's long abstention from any form of "corn laws." A remarkable feature is the fact that the heavy outlay for war expenses induced no economy along other lines; on the contrary, the ordinary expenditure of the Government was increased by about £23,000,000 during the past three years. Additional taxation to the amount of more than £75,000,000 was imposed during the war, of which only £53,000,000 was devoted to war expenditure.

—The war loans amounted in all to £159,000,000, of which £92,000,000 took the form of consols. The loans were very successful, so far as popular response is concerned, but the terms which the Government was able to make became more and more unfavorable as the war progressed, as appears from the contrast between the first loan, issued at 98½, and the last one, which was floated at 93½. At the close of the war, consols stood at 96, having dropped ten points or more since the summer of 1899. The very low point of 91⅛ was reached in November, 1901. Other forces, however, besides the war borrowing, contributed somewhat to the fall in consols. A comparison with the other principal wars in which Great Britain has been engaged since 1688 shows that the total cost of the South African war has been exceeded by only one other war, the twenty-three years' war with France (1793-1815). No other war has reached half the cost of the South African war. In proportion to its duration, the cost of the recent war is half as great again as that of any previous one. A greater proportion of the cost has been met by borrowing than was the case in the other important wars of the past century.

—'Some Experiences of an Irish R. M.' was a blithe work that won an immediate popularity, even with readers who knew nothing of the happy-go-lucky existence described by its authors, Martin Ross and E. Œ. Somerville. Their latest joint production, 'A Patrick's Day Hunt' (E. P. Dutton & Co.), is a short story profusely illustrated with colored plates. The scene is laid in County Cork, but the description of the pack, the run, and the members of the hunt would fit any hunting county in Ireland. "The like o' the crowd of people that was in Kyleranny that day never you seen—side-cars, and carts, and phaytons, and all sorts, let alone them that was goin' huntin'. Ye wouldn't hardly know there was hounds in it at all with the dint of the people that'd be around them, and it 'd be as good for you to thry to get into Heaven as to get past the cross roads. Ye'd lose your life cursin' before the owld women 'd stand out from under your feet. Ye'd have to be going around them this way, the same as a person that'd be winding a watch. 'Is it sick the Major is, that he's not in it?' says I to Tim Hurley, the Whip (that's the son of an Aunt of mine by the Mother), when I got to come at him, 'and Johnny Daly riding Monaloo?' 'He has the 'fluenzy,' says Tim. 'Is it bad with him?' says I. 'He's bad enough to-day,' says he, 'but yesterday he was clear dead altogether.' 'It's a pity anything would ail him,' says I. The Major was a fine man, always, and his family was a fine family. Sure me father used to say that in owld times if ye went to the big house ye'd get the smell o' roast beef when ye'd be no more than half-way up the avenue, and there'd be dhrinkin' all day and knockin' all night, and if ye axed the change of a half-crown it wasn't in it. Faith, I said to John Daly, there wouldn't be any fun, nor no cursin,' nor nothing, when the Major wouldn't be in it." Miss Martin of Ross is one of the well-known Galway family called for generations the "Kings of Connemara." Galway is a county notorious in Irish hunting circles for the "Galway

Blazers," which is the suggestive name of the most popular hunt. Miss Martin's handling of the vernacular is, naturally, excellent, and her experiences are at first hand. In a Christmas gift book like the present work the illustrations count for much, and Miss Somerville's share in the volume is perhaps the more important. The printing of the colored plates by Evans of London is unusually good.

LOWELL THE REFORMER.

The Anti-Slavery Papers of James Russell Lowell. 2 vols. Boston: Houghton, Mifflin & Co. 1902.

Immediately after his marriage to Maria White at the close of 1844, Lowell went to sojourn in Philadelphia, and entered into an engagement with the abolition *Pennsylvania Freeman* to furnish an editorial article fortnightly at five dollars apiece. Later, returned to the East, he rendered a service of the same kind to the *National Anti-Slavery Standard* of New York, but weekly, and at twice the previous pay. These leaders (five from the Philadelphia journal, in 1845, fifty from the New York, 1846-1850), were examined by Mr. Horace Scudder in preparing his Life of Lowell; some were epitomized, some freely quoted from. The need of this elegant reprint, therefore, is not at first sight apparent. Nevertheless, the collection shows how much an acute editor may miss by attacking his material piecemeal. On page 236 of his first volume, Mr. Scudder, with a slant at those abolitionists who, while being stigmatized as men of one idea, were chided or reviled for having too many reformatory irons in the fire, says of Lowell:

"His imagination and his sense of humor both prevented him from being a thick-and-thin reformer, and he refused to allow his hatred of slavery to be complicated with practical measures for the reform of various other evils which troubled society."

This is echoed by the scarcely well-informed writer of the Introduction to the present reprint, when he pronounces Lowell "surprisingly free from radicalism," yet cites approvingly from the very first leader in the *Freeman* the passage: "The aim of the true Abolitionist is not only to put an end to Negro slavery in America: he is equally the sworn foe of tyranny throughout the world." And here he stops, but Lowell, as will be seen on page 6, was arguing for that divorce of the anti-slavery agitation from politics to which the radical Garrison held his faction, since "if American slavery be politically abolished, the power of the abolitionist will extend no farther." And again, four years later (p. 195):

"Though chattel slavery be the most odious shape in which oppression presents itself, it is well for us to be accustomed to consider the abolition of it, not as an end, but as a step toward a more perfect reorganization of society."

In 1849, concerning Greeley's "contemptuous expressions toward Garrison and those who are nicknamed Garrisonians," Lowell wrote (ii., 83):

"The friends of every class of Reform in America owe a debt to Garrison, and in such matters there should be no repudiation. Especially let not the butt end of the wedge sneer at the *ultraism* of the entering part."

In fact, Lowell was at no pains to conceal his opposition to capital punishment, or his temperance views (in sympathy with his wife's brother William), or his condemnation of a pro-slavery church and clergy. But these volumes also make clear his complete possession by ideas which would now be called Socialistic. Of this, Mr. Scudder takes not the least notice, and his index has but two entries under Socialism, one in connection with Henry George and the address on Democracy of 1884; the other with the Introduction to 'The World's Progress' (1887), and both antipathetic to State Socialism. We must resist the temptation to cite freely on this point. Here is a decisive quotation from page 10 of the first volume:

"It is not money or railroads or factories that the Northern monopolist usurps; he lays his selfish hands upon human freedom like his brother at the South, and hence a feeling of unavoidable sympathy between them. The system of labor and of its reward at the North we sincerely believe to be but little better than that at the South."

The sound of this in his ears came back to him four years later while he still confessed that "the arguments of the anti-land-monopolists are entirely conclusive." He hedged a little (ii., 137):

"We do not see how any advantage is to spring from disputes as to whether this or that injurious system is entitled to an evil preëminence; but we are not to be supposed as granting that chattel-slavery is no worse than wage-slavery. It is one of those assertions which recoil disastrously upon those who make them."

We take leave of this theme by noticing the cropping up of Lowell's Socialism in the words he puts into Calhoun's mouth in the absurd colloquy with Foote and Cass. See particularly pages 79 and 82 of volume one for this curious incarnation. Mr. Scudder thinks the interlocutors "decidedly more discriminated in character than his old men of straw, Philip and John, so that the reader really seems to hear these worthies discoursing together, and not struggling against the betrayal of the master of the show, who is shifting his voice from one to the other." Calhoun, however, is unmistakably the mouthpiece of the Socialist playwright.

The present Introducer is again at fault—traducer rather—when he says that Mr. Lowell "never sympathized with the extreme wing of the Abolitionists in their attacks on the Constitution and their proposals to dissolve the Union." However, on page 4 following, one may read: "the new position assumed by the American Society [for disunion, seven months previously]. . . . I rejoice at the stand which has been taken by the Society. In my eyes it never looked so sublimely as now." On page 13—"reverence for a pro-slavery Constitution," "the utter worthlessness of that piece of parchment." On page 43 (of Webster)—"the defender of the 'Constitution' when he might have been the champion of Freedom and of Man!" On the corresponding page of volume two—"In repudiating the doctrine of dissolution as if it were something odious and shameful, we think he [the editor of the Boston *Republican*] acts unwisely."

At this period, Mr. Lowell was at one with his associates in standing fast for a purely moral agitation, and in holding it impossible to combine this with the conduct of a political anti-slavery party; at one in regarding (as did Birney) the American church as the bulwark of American slavery, and in finding it natural in the new "third party" to "resolve" that its members "have nothing to do with the assailants of the church and clergy." The prime utility of this reprint is in demonstrating just the reverse of what is ignorantly stated in the Introduction.

Lowell was not a born journalist; he was not even a born prose-writer. His natural vehicle was verse, as he again and again declared. These papers show a disproportionately long vestibule, an extensive cutting out of work, and a sudden pull-up. The seriousness of the reformer and the exuberance of the humorist often destroy the "keeping" of an article. From epigrammatic phrases like "public *want* of opinion," or "morals as high as the cispenitentiary degree—enough, that is, to keep them out of the State's Prison," we pass to an allusion to the "dark horse" custom of Presidential conventions, "The only feasible plan for them is to buy another pig in a Polk," or an allusion to the scriptural defence of slavery combined with mob violence, "an entertainment [for the anti-slavery lecturer] of Ham and eggs (the clergy and people contributing their respective quotas), which kept the promise of hospitality to the ear and broke it to the sense." Through it all, one encounters noble and inspiring sentiments never out of date, as, of caste: "When the moral vision of a man becomes perverted enough to persuade him that he is superior to his fellow, he is in reality looking up at him from an immeasurable distance beneath." True to-day is it: "In this country the civilization of the people has not yet come nearly up to the political principles set forth in the Declaration of Independence." All that relates to Webster, and there is a good deal here, is worth attention now, as showing how long before his 7th of March speech his readiness to sacrifice his principles for the Presidency was mistrusted. Latter-day whitewashing, with its false assumption of a juster perspective, needs this contemporary check. Let any one answer now Lowell's interrogatories in 1846 (i., 37): "What has Freedom to thank Daniel Webster for? What has Peace? What has Civilization? What has that true Conservatism which consists in bringing the earth forward and upward to the idea of its benign Maker?" This passage is succeeded by a striking personal reminiscence of Webster "when he defended himself in Faneuil Hall against the outraged Whiggism of Boston for having retained his seat in the Tyler cabinet," and displayed all his magnetic power and majesty of person.

These volumes demanded an index, which is denied them, and invited annotation. Twentieth-century readers need to be told who was "the Fox of Kinderhook" (ii., 49); to have the South Carolinian John Brown (i., 202) identified; to have the dictum, "That is property which the law makes property," remarked for Clay's on page 84 of volume two, before the ascription is overtaken on page 191. Shall we not also admit, with shame, that the historical satire on page 72 in the first volume will escape the penetration of fairly attentive readers? "Hangman" Foote *loquitur:*

"If, for the sake of appearances, he [Jefferson] declaimed against our wisest and

most cherished institution, he was neither so thriftless nor so inhuman as to turn the Ishmaels he had begotten into the desert. He was a prudent and economical farmer of all the qualities of his nature. If he made his organ of language profitable to him as a politician, he no less enriched his pocket as a private citizen by his philoprogenitiveness."

Finally, time's irony on the art judgment on page 218 of volume i., "Probably this world has never had five such sculptors as Powers," called for anticipation of the inquiry from the present generation—"Who the deuce was Powers?"

So tasteful, fairly costly, and limited an edition was bound to be correspondingly free from printers' errors. For the benefit of purchasers we subjoin such as we have observed: volume i. (p. 26, line 8), "these" for those; (p. 39, lines 12 and 14), omit comma after shallowness, "di grege" for "de grege"; volume ii. (p. 53, first line of last paragraph), "as" for from; (p. 172, last line), "natural" for neutral (compare p. 175); (p. 183, line 16), supply "law" after "moral"; (p. 195, line 5 from bottom), "put" for puts.

THE POLITICS OF ARISTOTLE.

The Politics of Aristotle. With an Introduction, two Prefatory Essays, and Notes Critical and Explanatory, by W. L. Newman. Vols. III. and IV. Pp. xlvi, 603, lxx., 708. Oxford: Clarendon Press; New York: H. Frowde. 1902.

The works of Aristotle have been sadly neglected by classical scholars in America. Not one in five hundred of American college graduates has read a page of Aristotle in the original, and not one in a hundred has been required by his college courses to read a page even in a translation. Yet Aristotle is the "master of those who know." Huxley in late middle life learned Greek in order to read his works in the original, although we should expect observations made before the invention of the microscope to be of slight interest to a modern scientist; and he showed in an interesting case that Aristotle was right where his unscientific interpreters had believed him wrong. And Gladstone is said to have counted the 'Politics' one of the three books to which he was most indebted. An examination of the catalogues of fourteen prominent colleges and universities of this country shows that courses in Aristotle's Nicomachean Ethics are offered by two universities in Greek and by two in English. The 'Metaphysics' is studied in English or in Greek in three universities, and the 'Categories' in one. Two courses are offered on the 'Constitution of Athens' and one on the 'Politics' in Greek, while the reading of the 'Politics' in English is part of the work in political science at two other institutions. But in the particular year covered by the catalogues examined, these courses in the 'Constitution of Athens' and the 'Politics' in Greek were not given.

The published work of American classical scholars shows the same neglect of Aristotle. No paper on him or his works is printed in the 'Transactions' of the first thirty annual meetings of the American Philological Association, and the index to the first twenty volumes of this publication notes but one such paper as read before the Association. The first twenty volumes of the *American Journal of Philology* contain but one article based on a work of Aristotle, suggested by the then recently discovered 'Constitution of Athens,' and one note of less than a page in length on the 'Metaphysics.' In the first ten volumes of the "Harvard Studies in Classical Philology," the nearest approach to our author is in a paper on Homeric quotations in Plato and Aristotle, which naturally does not enter into esoteric Aristotelian discussions. Apparently, only two or three American dissertations for the degree of Ph.D. in classics have had to do with Aristotle. His position in German scholarship forms a marked contrast to his treatment in America. An index to the German classical publications for a quarter of a century, 1873-98, gives nearly twice as many pages to Aristotle as to any other Greek author. Such eminence is doubtless due to the volume and variety of his works, but this makes the American indifference still more noteworthy. But two or three of our classical scholars of a younger generation are now publishing occasional papers on him in philosophical periodicals, and at last the influence may spread to the philological.

Oxford, however, is the true stronghold of the study of Aristotle in modern times. Probably no other city, large or small, contains so many scholars acquainting themselves at first hand with at least some of his views. Of the great and useful editions of Aristotle's works published in the course of the last thirty years, England has furnished more than all other countries together. For the study of the Nicomachean Ethics the most important works are Bywater's critical edition of the text, Jackson's learned and stimulating edition of Book V., Stewart's two volumes of commentary, and the convenient exegetical editions of Sir Alexander Grant and of Burnet. In recent years, Germany has given us no work to match any one of these, except Susemihl's poorly printed edition of the text. For other works, Kenyon's and Sandys's editions of the 'Constitution of Athens,' Wallace's 'Psychology,' Cope and Sandys's 'Rhetoric,' and Butcher's 'Poetics' give the fullest and best commentaries of recent years. Jowett's translation of the 'Politics,' with a volume of notes, just preceded the publication of the first two volumes of Newman's edition, and in 1894 Hicks published an excellent and convenient revision and translation of the first part of Susemihl's edition with German commentary. Thus we have a fine shelf-ful of English editions of Aristotle, scholarly and attractive, in large type which contrasts strikingly with the typography of the ordinary German editions. The quarto edition of the Berlin Academy, published in 1831, has become such a standard for reference that the preservation of the same lines is convenient, and, to attain this end, the Teubner text of Aristotle is set in type much smaller than that used for the other Greek authors, while the English publishers have been luxurious in the use of large type and good paper.

The first two volumes of Newman's edition of the 'Politics' were published in 1887, and were reviewed in these columns. The four volumes contain 2,513 pages, of which 224 are occupied by the Greek text, 131 by critical notes, 1,177 by the exegetical commentary, about 700 by essays and appendixes, and 132 by indexes. The ordinarily convenient plan of having text and notes on the same page is manifestly impracticable here, since less than one-tenth of the space is given to the text, which hence would form but a narrow rivulet on the page. Consequently, the reader who desired a copious draught of Aristotle rather than of commentary would be seriously inconvenienced, having but a small part of a sentence on the page before him, for frequently the comments on a single line occupy more than a page. But this arrangement is at least more convenient than that of Stewart's commentary of 1,012 pages on the 'Ethics,' which furnishes no text of its own, but refers the reader to Bywater's edition. The 'Politics' should be read by many more than have the leisure to study such a commentary and such essays as Newman's, but this edition will be of high value not only to those who take it all in course, but perhaps especially to those who desire to consult it occasionally. The reviewer has read about five hundred pages of the commentary, and pronounces it anything but dull and heavy reading. The editor, like Aristotle himself, draws illustrations from all quarters, including the modern as well as the ancient world. Frequent references are made to Bryce's 'American Commonwealth.' Bare references to authorities are not so frequent as full quotations, and the commentary will be useful to the student of political science who, with a limited knowledge of Greek, is using Jowett's or Welldon's translation, but desires a commentary. The characteristics of the first two volumes are maintained. The work is learned and accurate, and furnishes the most complete apparatus for the study of the 'Politics' which is likely to be published within the lifetime of scholars of to-day. Perhaps some may feel a certain lack of perspective, in the similar treatment of more familiar and less familiar matters, but for such a work this has its advantages. That nothing should be overlooked, and that the editor should agree with the reviewer in the interpretation of all doubtful passages, could not be expected.

An interesting Appendix of Reminiscences of passages in the writings of Plato could be extended. It does not include the remark in 1324 b 22, that the true statesman will not hold a part of his art to be the consideration how he shall acquire power over men, whether they desire it or not. This is a distinct allusion to Plato's "Ship of State" (in the 'Republic,' 488), where the true pilot, who is fitted to command, will not think there is any art in securing control of the ship, and, if there be such an art, will believe this to be incompatible with the art of ruling. The Aristotelian passage aids in the interpretation of the Platonic sentence, and, on the other hand, a careful comparison of the Platonic sentence would have saved the editor from suggesting an inconsistent construction for one of Aristotle's words. In another passage the editor seems to be out of his true field. At 1338 a 25, Aristotle quotes as Homeric a verse which is not found in our manuscripts of Homer, and then adds a bit which is in our Odyssey. The editor, with others, supposes that the two fragments belong together, and he rewrites the Homeric passage so as to introduce the new line. In the process, however, he omits a half-verse which is quoted with the follow-

ing by Plato in the 'Republic,' and makes carpenters to be called not to a settlement as useful men for a hamlet (as our Homeric text would have it), but to a feast, in which we may suppose they could be of no special service. The Homeric nobles had reasonable views of the dignity of labor, but they would not take special pains to invite carpenters to their feasts, and the Homeric passage does not imply a feast, but work.

The editor adopted fifteen years ago the view that Books VII. and VIII. of the MSS. and old editions had been displaced, and should follow immediately after Books I.-III. To this order, naturally, he holds still, only saying rather mildly that he is not sure that Wilamowitz-Moellendorff is right in his view of the original order and its change. Wilamowitz believes that Aristotle's lectures on politics were among his very earliest courses of instruction, and that they were often repeated; that the discussion of fundamental questions (Books I.-III.) was followed originally by a consideration of the best state (Books VII., VIII.), though in later years the lecturer postponed the discussion of the best constitution, and inserted a discussion of the essence, the differences, and the changes in constitutions (Books IV.-VI.), but, since the course was often repeated, parts of I.-III. may be later than VII., VIII. Every teacher of to-day will readily believe that Aristotle was not able always to conclude his course of lectures exactly as he had planned, and will demand no further explanation of the groups IV.-VI. and VII., VIII. Huxley thought that our manuscripts of the 'Historia Animalium' were based on notes taken by students, explaining thus from his own examination of note-books the broad contrast between acute, accurate observations, due to the master, and minor inaccuracies which are likely to be due to the student. Every instructor is grieved at times to learn how he has been misunderstood even by his best students. Newman rejects the view that our 'Politics' is based on students' note-books, and as evidence of this calls attention in the commentary to passages which show attention to literary style not likely to be caught by a student in taking notes. Wilamowitz believes that our 'Politics' is based on the drafts which Aristotle made for use in his lectures, drafts used several times and containing both earlier and later elements. This seems to explain the facts better than any other hypothesis. That some passages were written out in greater detail than others and with particular care is natural. Nothing indicates that either this work or the Ethics was published by the philosopher himself. We know him, perhaps, after all, rather as a teacher than as an author. The 'Historia Animalium' may have been published from note-books, in default of the lecturer's drafts, but the 'Politics' from his papers after his death.

Aristotle collected through his students more than one hundred and fifty constitutions of States in Greece and out of it. This collection was of great use to him in his lectures, and the gathering and sifting of the material must have been admirable work for his "research-students"—just such subjects as are sought by the modern candidate for the degree of Ph.D. Perhaps an analogy for the number and variety of these constitutions might be found in American colleges and universities, where many experiments have been made in administration, the government of students, the manner of appointment and the tenure of office of the instructors, the duties of instructors and their part in the management of the institution, and the like. Each of the older institutions and others still very young have made changes in these respects, which would prove an interesting subject for investigation. If the facts could be ascertained, what principles one college had borrowed from another, and why it had deviated from the ordinary rule, under what influences and with what limitations the appointing power had been given to the President, or to the trustees, or to the faculty, material for a doctor's dissertation would be at hand in almost every college. A change of administration and the introduction of a strong man as President has often caused a complete change in the unwritten constitution of the college. Many such essays must be written before a really authoritative book on college administration in America can be composed.

The editor's criticism of Aristotle's treatment of education may be of interest:

> "Does Aristotle's scheme of education call for enough effort from the young? . . . Would not a training which gave them more difficulties to face and to conquer, develop in them more force of will and be more really useful to them? Does not education largely consist in requiring the power and the will to do that which is distasteful to us, when it ought to be done?"

Rhode Island—Its Making and its Meaning: A Survey of the Annals of the Commonwealth from its Settlement to the Death of Roger Williams, 1636-1683. By Irving Berdine Richman. With an introduction by James Bryce. In two volumes. G. P. Putnam's Sons. 1902.

Mr. Richman's book is not a study in the origins of political or economic institutions, or an analysis of the forms of colonial government. It is essentially a plain narrative of the chief events connected with the early history of Rhode Island, from 1636 to 1683; it is the story of the "making" of Rhode Island, told for the purpose of elucidating its "meaning"—for the purpose, that is, of showing that Roger Williams and the colony which he founded furnish the connecting link between the religious reformation of the sixteenth century and the political revolution of the eighteenth century. The central idea of the Reformation was individualism. Roger Williams was the first man to understand the full significance of individualism on its religious side; he did not, however, fully understand the significance of individualism on its political side. It was the work of Rhode Island, as distinguished from the work of Roger Williams, to understand and establish this idea also.

This theory is worked out substantially as follows: Massachusetts, in attempting to establish and maintain a theocracy, found itself in conflict with the "Time Spirit" of toleration. This "Time Spirit," which was represented in America by Roger Williams and others, supplied the condition which made a new colony necessary. Rhode Island was the result of this necessity. Freedom of conscience was made the cornerstone of the new colony, and the struggle for "political individualism" was immediately begun. This struggle finds its expression, on the mainland in the establishment of government by a majority of householders, on the island in the contest between the Coddington people and the "Hutchinson-Gorton combination." In both cases the principle of political individualism triumphed. The land system which was developed was typical of the same struggle; that of Providence was opposed to political individualism, while that of Aquidneck fostered it. The further development of this principle, which was given wide recognition in the first Rhode Island Constitution (the government established in 1647-50), was checked for the time being by Coddington's "coup d'état," and was ultimately subject to some wholesome restrictions, the precise nature of which does not clearly appear. The principle of freedom of conscience was formally recognized by the English Government in 1644 and in 1663, but meanwhile, in practice, it encountered, at the hands of "Destiny," two crucial tests. The first "test" was that of persecution, at the hands of Massachusetts, in the persons of Holmes, Clarke, and Crandall. The second "test" was concealed in the problem as to how far individualism should be allowed full swing in resisting governmental authority. For this test the instrument of Destiny was William Harris, who denied the legitimacy of any governmental restraint. At this point Roger Williams and Rhode Island part company: the former maintains that individualism shall not be permitted to go so far; the latter maintains the doctrine of "Soul Liberty" to the logical end. Nevertheless, by the author's own account, after political individualism had "paralyzed the arm of Rhode Island in time of peril from the Indians," the colony itself apparently came back to the position of Williams, or nearly so.

When a student of history groups the results of a long series of careful investigations about a central principle or theory, the initial question which must always be asked is this: Is the theory the result of the investigation, or is the investigation the result of the theory; has the student tried to "understand by investigation," or has he investigated what he is convinced he already understands? In the latter case the work will most likely have very little historical value. In the former case a second question arises: Is the theory a correct inference from the facts which have been presented?

While one is strongly tempted to suspect that Mr. Richman's investigation was the result of his theory rather than the reverse, the book is in no sense mere special pleading. On the other hand, the author has produced an unusually careful and impartial piece of investigation. It is based upon a full knowledge of the printed sources, and the examination of some important manuscript collections. It has been presented with great wealth of detail, and in a style that is clear and not without its charm. While less attention has been paid to constitutional questions than one might expect, and while the almost total disregard of economic conditions is disappointing, the author has nevertheless shown otherwise a sufficient care for proportion and perspective, and no event or phase of development has been wrenched,

to any appreciable extent, out of its proper setting for purposes of advocacy. So conscientiously, indeed, has the work of investigation been done that it does not, in great part, obviously or convincingly connect itself with the theory which it purports to set forth. There are whole chapters (*e. g.*, x., xiv., xv.; the last is perhaps the most valuable part of the book) which are altogether remote, apparently, from the central thesis; while most of the chapters which do connect themselves with that thesis contain much extraneous matter. This distinction is clear even in the table of contents, where the statement of the theory has been sandwiched in, at proper points, between the chapter headings. The theory, in fact, is not an unbroken thread which we follow continuously, but rather a series of mile-posts in front of which the author stops us at intervals in an interesting journey, for the purpose of indicating where, precisely, we are. The theory is thus detachable from the investigation, or the investigation from the theory, according to the inclination of the reader, neither interfering seriously with the other. If, therefore, Mr. Richman has technically adopted the method of the advocate rather than the method of the historian (we do not assert that he has), he has successfully avoided the dangers which that method inevitably involves.

As for his theory in general, one may be permitted to suggest that it is a far cry from the reformation of the sixteenth century to the revolution of the eighteenth, and perhaps so small a link as Rhode Island is likely to need some stretching before it can be made successfully to reach from the one to the other. On the whole, Mr. Richman appears to us a careful investigator, but not altogether a profound political philosopher. It is his contention, for instance, that Roger Williams did not understand the full significance of "Soul Liberty" on its political side, as it is understood to-day. In a narrow sense, this is true; more broadly considered, it is not. It is true that Roger Williams believed that preaching against the legitimacy of governmental restraint might, in general, be rightly suppressed. It is true that in England and the United States such preaching is now, in general, permitted. But why? Because, in general, such preaching has no appreciable effect on the stability of the existing political authority. The fundamental question which individualism in politics raises, is not whether this or that expression of individualism shall be permitted, but it is whether the principle of individualism shall be permitted to undermine and destroy the State. Roger Williams believed essentially that it should not be permitted to do so; most people to-day, even in "England and the United States," agree with him. In fine, the "full significance" of individualism in politics is anarchy. The State, if there is to be any State at all, must protect itself by drawing a line between that expression of individualism which is permitted and that which is not. This line was drawn at one point in theocratic Massachusetts, at another in the tolerant but small and weak Rhode Island; it is drawn at still another in the great and powerful United States. The principle, however, is the same in each case; the application of it will depend upon the character of the State and the firmness of its foundation.

On the whole, the work of Mr. Richman is a valuable contribution to American Colonial history. Some exceedingly useful maps supplement the text. A fuller citation of authorities would have pleased some readers, and irritated others. An exhaustive bibliography of sources would have added materially to the value of the work.

Essays Historical and Literary. By John Fiske. Volume I. Scenes and Characters in American History. Volume II. In Favorite Fields. The Macmillan Co. 1902.

These posthumous volumes of Mr. Fiske's possess a good deal of interest, though not always a very novel interest, at least to his readers. Half of them are historical, dealing with the "last Royal Governor of Massachusetts," Hamilton, Jefferson, Madison, Jackson, Webster, and other worthies; the other half gives us *inter alia* glimpses of the historical method, of Mr. Fiske's view of the bearing of evolution on religion, reminiscences of Tyndall and Huxley. They are all of a popular sort—that is, are designed for a popular audience—and must not be read too critically. They all have merit, derived not merely from lucidity, but from a characteristic simplicity which was Mr. Fiske's own, and which helped to give him the art of carrying his audience along with him, no matter what he touched upon. Occasionally his simplicity gets the better of him; he falls into a kind of boyishness of expression which is perhaps not well suited to the subject in hand.

In his essay on Old and New Ways of Treating History he gives a much clearer exposition of what the new historical school, successors of the men of the order of Freeman, Stubbs, and Gardiner, are about than they have ever given for themselves; with all the more impartiality, too, that he was not himself altogether one of them. He was primarily a scientific man (his scientific attainments and learning were comprehensive enough to have made a name for him without anything else) who in the middle of his career diverged into history, and developed a remarkable power of popular historical exposition, so that, while he was originally known as the standard-bearer *in partibus* of the Spencerian philosophy, it seems probable now that he will be remembered chiefly hereafter by his striking contributions to American popularized history. But these contributions are not in the main works of research or original investigation. They are in many respects what historical writing was before research was ever heard of; that is, they are primarily literary, narrative, and descriptive. Their superiority over much of what went before them consisted in their being much better done, not in their being done on any novel theory or plan. They also introduced into American historical writing a feature of which Macaulay first revealed the secret—that of reconstituting the past by actually introducing us to the daily life of the period—a feature lacking in some of the best volumes of even so recent a writer as Parkman.

Of the scientific portions of these volumes we do not undertake to speak with authority. Fiske's reminiscences of Huxley and Tyndall are interesting, but perhaps the most curious paper is that in which he explains his religious views. To most minds—to Huxley's above all—the tendency of the evolutionary view of the universe was towards agnosticism. Not so, however, in the case of Mr. Fiske. Evolution is exactly what mankind has long been waiting for as a sort of new Revelation; it is what we might have anticipated, had we not been dull enough, until within a few years, to miss the point. The essay, considering who the author is, is certainly a strong proof of the ineradicable craving of the human mind for some religious basis for the phenomenal world.

We have not space to go into details, but strongly recommend the volumes, even to those who are already well acquainted with the author. The essay on Charles Lee is, to us, quite new and very entertaining.

American Animals: A Popular Guide to the Mammals of North America North of Mexico, with Intimate Biographies of the more Familiar Species. By Witmer Stone and William Everett Cram. Doubleday, Page & Co. Small 4to, pp. 341. Illustrated.

This is a good sample of what may be accomplished in a popular work scientifically handled. It is said to treat of every species and variety of mammal found in North America east of the Mississippi, all of the varieties of big game animals north of Mexico, and only the most important species of the others west of the Mississippi. A first impression obtained by turning these pages is that they contain more of real life than is the case with most works of similar purpose, and this impression is strengthened by closer examination. Mainly, it is due to the large number of excellent photographs from live animals. The pictures are ably seconded by a text well adapted for securing and retaining the reader's attention. The volume is a popular-science work, in which the popular features are generally so good as to enhance the value of the science—not the most common peculiarity of popularized science.

Points for criticism occur here and there, especially in connection with the illustrations. In many cases these are distributed without regard to their accompanying texts. The texts of the mountain goat and the mountain sheep are illustrated by the figures of the prong-horn antelope, and the article on the bison by those of the mountain goat and the musk ox. The prong-horn's text contains the figures of the woodland caribou, the only figures in the limits of the essay on the Virginia deer are those of the wapiti, and the armadillos are to be found in the description of the whalebone whales. By search the reader is able to locate figures that should be in the article to which they belong. A few of the plates are from colored drawings; in these the selection of colors in reproduction could not have been made with a view to doing justice to the artist.

At times, in the notes on habits, one may detect something like straining for a conclusion almost or quite out of reach. The old grizzly, we are told, writes his challenge by clawing the pine tree as high as he can. Another grizzly finds the tree, and, unable to reach as high, leaves the range to the first; but if able to reach as high or higher, he stays and hunts as he pleases

until the combat decides. The author concludes:

"The method of challenging all comers is common to a great many wild beasts, large and small; not only bears of all kinds and many of the smaller hunters, but deer and moose as well. And I am inclined to think that when the house cat stretches up to sharpen his claws on the trunk of a tree, it is a similar challenge for other cats to read."

A question to be asked in this connection is whether the cat, the bear, or the deer really exerts himself to reach as high as he can when working off some of his surplus energy in this way. Beavers, again, are said to be so persecuted that they scarcely dare to raise a lodge or dam, but are compelled to hide in secret burrows beneath the bank. As a trapper would tell it, on the contrary, the beaver builds a dam and a house only when and where he needs them. On a strong stream, with an eddy in which to sink the supply of brush in front of a bank to burrow in above the floods, he is simply a "bank beaver," in need of neither dam nor house, and not so easily trapped as those with dams and houses. Fishers are said to be as much at home in the treetops as pine martens, and to climb where the partridges roost to catch them in their sleep. The partridges usually bearing the name roost on the ground. Raccoons are said to dig hornets' nests out of the turf; but the insect commonly called hornet swings his paper nest from branches or other supports in the air. A Canada lynx is said to have a "retrousse tail."

A key to the genera is given; there is also a short bibliography.

Glimpses of China and Chinese Homes. By Edward S. Morse. Boston: Little, Brown & Co. 1902.

Modestly set forth as is Professor Morse's volume, it is a noteworthy addition to our knowledge of China, for to this work he has brought the same competence, industry, and zeal which made his 'Japanese Homes' uniquely valuable. One does not, indeed, get from this work the idea that the author is altruistic or philanthropic. Rather, the tone of it, in contrast with his high praise, amounting sometimes to rhapsody, of the Japanese, seems startling. Perhaps he was spoiled by his comfort and his popularity in Japan. Yet, even making all allowance for the winsomeness of "things Japanese," he seems almost savage in tone when decrying the Chinese generally, so that one is almost tempted to discount the value of his judgments of Japanese, whom he flatters so highly. He does not seem to make proper allowance for the fact that the Chinese, being an old race, have necessarily the defects and diseases of age, and possibly of decrepitude; while the Japanese, in comparison, are a young race with a very new country. The critical student sees no Japanese civilization, based on writing and letters, before the fifth century of the Occidental era, while in China the historical period begins at least nine hundred years before Christ, with trustworthy traditions reaching still further. On many points the author's standards of comparison are certainly unfair, because they are always with Japan and the Japanese, and not with other countries and races. Certainly, a wider induction of facts would have given the reader more confidence in Professor Morse's judgment.

Apart from this, however, his book, for its architectural information, is a genuine contribution to science. His sketches, though possessing no artistic merit, are, for truth, at the antipodes of the deceptive or thoroughly misleading pictures of French and other artists that have so long dominated our popular works on China. The descriptions of the Chinese homes, and the dinner—with the leavings thrown on the floor—of the back yard, the theatre, the prison, and the peasant's house, worthily supplement, in the interests of science, Dr. Smith's great works on 'Chinese Characteristics and Village Life.' We have realistic descriptions, which we can depend upon, of the examination hall, military drill rooms, and the water clock.

In one instance, in his zeal for science, the author hired a boat and faced the howling mob in a potter's town on the river beyond Canton. Though apparently his life was in danger, he saw the working of a Chinese potter's wheel, of which he gives a sketch. The wheel rests on the ground, and the potter squats beside the wheel, while the helper, holding to a rope hung from above, rests on one foot and kicks the wheel around with the other foot. Unlike the potters in all other parts of the world, he lifts the clay vessel from the wheel, which has been previously sanded, and, though somewhat deformed by this act, the pot is afterwards straightened by the spatula and the hand. The ovens, though like those in Japan, are much more substantially built. Barren as a brick yard, the Chinese pottery, without a green leaf or flower, contrasted frightfully with the hospitality, politeness, and love of work and beauty of surroundings of the Japanese potter. Followed back to his boat by a "venomous mob of thoughtless brutes," the seeker for knowledge "no longer wondered that magistrates could order these people to be beheaded by hundreds without a quiver of feeling"—which order and process, he declares, he would at that moment have enjoyed and witnessed with equanimity. Mr. Morse justifies our Chinese Exclusion Act, believing that in those respects in which the Chinese are different from us they represent a savage race.

The book is handsomely presented and is well indexed. It will have a welcome on the lengthening shelf, where the material is gathering which some day a literary master will coördinate into science.

Our Homes, and How to Beautify Them. By H. J. Jennings. With numerous illustrations. London: Harrison & Sons. 1902. Pp. 254.

This is one of many books devoted to the subject of inexpensive decoration of domestic interiors. Although there is mention of the statelier ways in which ornamentation has been carried out in old times, and much insistence upon the splendor of Renaissance and later furniture, on the spirit and movement of Elizabethan plaster work, on the refinements in carving and in inlays of colored woods of the eighteenth-century English makers, there is still at least a superficial semblance of thinking for the people of small means who, however impecunious, must needs have suggestions of splendor. The lecturer who tries to interest his audience in interior decoration, finds the same hindrance now that he found thirty years ago: if he shows on the screen the magnificent interiors of the seventeenth century, or talks of the refined decoration of the eighteenth century, he is told by his audience, if he consults them, that he is talking over their heads and showing them what they cannot imitate. If, on the other hand, he tries to show them what they might really have which is at once tasteful and inexpensive, he will find that his audience yawns.

With the disappearance of well-defined classes of society, showing itself most obviously in the replacing of costume by fashion, there has come to be also that lack of distinction between the styles of adornment in other things than dress. There is no decoration suitable for the quiet domestic house of small cost or small rental, because its owner is not really satisfied unless there is copied in its furnishing and its appliances as much of the magnificence of the past as he has happened to notice or to have heard mentioned. The exceptions to this rule are the only interesting decorations of modern times. We have some such exceptions in the suburban houses built in the neighborhood of Boston during the last twenty years—houses in which the architects have carried their designing into the details within, and have panelled their walls and put up chimney-pieces in the character of the simple exterior, keeping all the rooms in harmony, one with another. Such interiors may be very inexpensive in their fitting up, and their furniture need cost but little, and yet there will frequently be beauty in them.

If we understand aright the book before us, the author is seeking to assert the possibility of having such things in modern England also, and while he shows magnificence, he seems to be quite aware that the person of small means ought not to seek the magnificent. The frontispiece gives the long gallery of Knole, in Kent; or, at least, a photograph of that reproduction of it which was set up by a London firm of upholsterers at the Paris Exhibition of 1900. Another full-page plate shows a "French Renaissance Dining-room," the expense of which, even if it were in pounds sterling, would be in the thousands—supposing always that the work is solid and respectable, and turned out by responsible makers of such things. But, on the other hand, there are simplicities enough: even in the large plates there is the modification of a Jacobean Hall and of a supposed Elizabethan fireplace; "a Renaissance Dining-room" which, if studied from anything of the sixteenth or seventeenth century, would at least seem to have been studied from the simplest parts of the mansion in which it is found; a "Hall for Country-house," in which the plainest of woodwork and plaster, and the commonplace fittings, unite to reassure the would-be economical builder.

There are a great number of text illustrations, half-tone cuts from good examples of writing-desks, tables, and cabinets, sofas, settees, and chairs of many epochs. But with mention of these pictures must come a needed reference to the fact that all these pictures, except a few taken from "the Louvre, South Kensington, and private collections" are furnished by one London firm, and that the text makes constant allusions to the work of this firm, so that one is a little surprised not to see their name appearing on the title-page as the

publishers of the work. It is not to be denied that the resources of one large and enterprising firm of upholsterers might supply material enough for a book of this sort. We know of half a dozen such houses in New York—houses whose experience would work up into a most fascinating record, which would be full of instruction for such as wish to learn by the experience of others. Hence it is not absolutely in condemnation that we mention the very peculiar conditions under which this book seems to have been prepared and published.

BOOKS OF THE WEEK.

A Garland of Love: A Collection of Posy-Ring Mottoes. London: Arthur L. Humphreys.
American Essays. Edited by E. E. Hale, jr. Globe School-Book Co.
Aspects of the Jewish Question. By a Quarterly Reviewer. E. P. Dutton & Co. $1.
Barry, William. The Papal Monarchy, from St. Gregory the Great to Boniface VIII. (The Story of the Nations.) G. P. Putnam's Sons. $1.50.
Bell, Malcolm. Sir Edward Burne-Jones. (Bell's Miniature Series of Painters.) London: George Bell & Sons; New York: Macmillan. $1.
Bellairs, E. G. As It Is in the Philippines. Lewis, Scribner & Co. $1.50.
Bingham, N. W. Rollicking Rhymes of Old and New Times. Henry A. Dickerman & Son.
Bond, R. W. The Complete Works of John Lyly. 3 vols. Henry Frowde.

Schilling's Spanish Grammar

Translated and edited by FREDERICK ZAGEL. 340 pp. 12mo. $1.10 *net*.

"I am happy to say that you have done more than a mere translation of the German work; you have made a most felicitous adaptation of it to the use of the American students. The thought of doing something of the kind had more than once crossed my mind, for I knew Schilling's Grammar, and I thought it ought to be translated; but I lacked time and courage. I trust your work will be brought to the notice of a large number of students of Spanish, for I feel sure they will gladly and thankfully use it as soon as they know it; for my part I will consider it my pleasant duty to do all in my power to call upon it the attention of all such friends and acquaintances of mine as are interested in the study of Spanish."—*Prof. C. L. Speranza of Columbia.*

Henry Holt & Co.,

29 W. 23d St., New York 378 Wabash Ave., Chicago.

SELECT PASSAGES FROM

The Introductions to Plato

By BENJAMIN JOWETT, Late Master of Balliol College and Professor of Greek in the University of Oxford. Edited by Lewis Campbell, M.A., LL.D. 16mo. Cloth, 85 cents.

"A wish has often been expressed that the late Master of Balliol's Introductions to his translations of the Platonic Dialogues might be published in a separate form. This step has hitherto been prevented by considerations which it is unnecessary to mention here. But it was thought that a select number of significant passages in which Professor Jowett had made Platonic interpretation the vehicle of his own thoughts might be of interest and use to many persons, for whom the examination of five octavo volumes might seem too formidable a task."—*From the Preface.*

European and American Plan

The BERKELEY HOTEL

Boston.

John A. Sherlock, Proprietor.

Facing on Berkeley, Boylston, and Providence Streets; but one block from the far-famed Public Gardens and the same distance from Copley Square; is but two minutes' walk from the Art Museum and Trinity Church; is directly opposite the Institute of Technology, and but five minutes to all theatres, shops, and the business section. Restaurant à la Carte. Dining-Room. Table d'hôte, Café and Billiard-Room for Gentlemen.

¶Messrs. McClure, Phillips & Co.

announce the publication on January 1, 1903, of the first number of the

Journal of Comparative Literature,

under the editorial management of

GEORGE E. WOODBERRY,
Professor of Comparative Literature in Columbia University;

J. B. FLETCHER,
Assistant Professor of Comparative Literature in Harvard University;

J. E. SPINGARN,
Tutor in Comparative Literature in Columbia University.

¶The Journal will be devoted to the interests of the comparative method in literary study and investigation at home and abroad, and the most eminent scholars in this field will collaborate with the editors to make it thoroughly representative.

¶The Journal will be issued quarterly.

The price of single numbers will be seventy-five cents, and annual subscription will be three dollars. Subscriptions and all business communications should be addressed to

McClure, Phillips & Company,
at 141-155 East 25th Street, New York.

¶*A circular containing additional information will be sent on application.*

THE FOURTH EDITION

THE de WET BOOK

is everywhere hailed, on publication, a remarkable narrative

The N. Y. Tribune:

"For REAL, RED-BLOODED interest, commend us to THREE YEARS' WAR, written by CHRISTIAAN RUDOLF DE WET. . . . it is the frank outpouring of the mind of the man whom we may call THE NOBLEST ROMAN OF THEM ALL."

In a column editorial, the *New York Evening Post* likens this book to GRANT'S MEMOIRS and compares its author with

CROMWELL.

The Associated Press in a London cablegram declares:

"It is perhaps the MOST REMARKABLE BOOK by the MOST REMARKABLE LEADER that any recent war has produced."

"UNIQUE IN MODERN LITERATURE. . . . ONLY A CLASSICAL COMPARISON can do it justice."—*Brooklyn Eagle.*

The Arab Conquest of Egypt and the Last Thirty Years of the Roman Dominion.

By Alfred J. Butler, D. Litt., F.S.A. With maps and plans, 8vo. Cloth, $5.35.

The Harmonics of Aristoxenus.

Edited, with Translation Notes, Introduction, and Index of Words, by Henry S. Macran, M.A. Cloth, $3.50.

Dante La Divina Commedia.

Text by F. Moore. Commentary by H. F. Tozer.

In response to several suggestions, it has been decided to divide Dr. Moore's text of La Divina Commedia and Mr. Tozer's notes thereon into three parts each. They can now, therefore, be purchased as follows:

Inferno Text
Purgatorio Text } 75 cts. each.
Paradiso Text

COMMENTARY to each of the above, $1.00 each.

Appian Civil Wars: Book I.

Edited with Notes and Map by J. L. Strachan-Davidson. 8vo. Cloth, 90c.

A History of Agriculture and Prices in England.

From the year after the Oxford Parliament (1259) to the commencement of the Continental War (1793). Compiled entirely from original and contemporaneous records by James E. Thorold Rogers. Edited with sundry additions by one of his sons. Vol. VII. (*completing the work*) in 2 parts. 8vo. Cloth, $12.50.

Also published by Henry Frowde:

Select Passages from the Introductions to Plato.

By Benjamin Jowett, Late Master of Balliol College and Professor of Greek in the University of Oxford. Edited by Lewis Campbell, M.A., LL.D. 16mo. Cloth, 85 cents.

"A wish has often been expressed that the late Master of Balliol's Introductions to his translations of the Platonic Dialogues might be published in a separate form This step has hitherto been prevented by considerations which it is unnecessary to mention here. But it was thought that a select number of significant passages in which Professor Jowett had made Platonic interpretation the vehicle of his own thoughts might be of interest and use to many persons, for whom the examination of five octavo volumes might seem too formidable a task."—*From the Preface.*

Select Passages from the Theological Writings of Benjamin Jowett.

[Edited by Lewis Campbell, M.A., LL.D. 16mo. Cloth, 85 cents.

For Art Collectors

¶ The well-known valuable art collection of the former Mayor of Cologne, Germany, the late Carl Thewalt, is to be sold by the heirs in its entirety, according to the wish of the deceased. This collection, begun forty years ago, is to-day probably the most important private collection in Germany. It contains some 3,000 objects, of which 250 were united to form the "Thewalt Room" in the Dusseldorf Exhibition of 1902.

¶ The collection consists of an assortment of the rarest and most precious masterworks of the Middle Ages and the Renaissance selected with the greatest care and taste, and admirably illustrating the evolution of the various artistic crafts of the periods. It is in the house of its former owner, Victoria-strasse 23, Cologne.

¶ Further information may be obtained from the heirs, Messrs. Thewalt in Cologne, or from their representative, P. Haustein, Art-Dealer, in Bonn, Germany.

The Nation.

NEW YORK, THURSDAY, JANUARY 8, 1903.

The Week.

President Roosevelt rings true again in the matter of the post-office at Indianola, Miss. The office in this place was in charge of an excellent colored woman who had filled it for a number of years, always with complete satisfaction to the Post-office Department and to the neighborhood she served. Originally appointed by President Harrison, she was reappointed by President McKinley nearly six years ago. Her character and standing are of the best, but of late the rowdy white element in the community, whose Anglo-Saxon chivalry towards her sex is reserved for white women exclusively, has tried to drive her out of office simply because of her color. The just punishment of the town is the closing of the office. The prosecution of the offenders belongs, under the circumstances, to the community, and the President's action is a proper bringing to bear of pressure to that end. Southern regeneration from lynching must come from the South itself; but the Federal Government should not withhold its moral influence when its own officers are threatened. Meantime, as was foreshadowed, the President has sent in Dr. Crum's nomination for the Charleston collectorship.

Whatever else may be said of Senator Hoar's Anti-Trust bill, it may be confidently affirmed that it is not a measure which will become law at this session of Congress. It is a long and intricate bill, which it would be the easiest thing in the world to talk out in the Senate, even if the chairman of the House Judiciary Committee were not strongly opposed to it, as he explicitly announces that he is, and even if the President were not disinclined to let Mr. Hoar steal his thunder. He has notified the country through the press that the Administration's measure is something apart from the Massachusetts Senator's.

A mass meeting was held last week in Faneuil Hall to urge upon Congress the imperative necessity of an immediate repeal of the duties upon beef and coal. The gathering was interesting principally on account of the prominent Republicans who had some part in the proceedings. Of course Mr. Foss was present, and advocated, as "a Republican and a protectionist," free iron, free coal, free hides, and Canadian reciprocity. Then the Rev. Edward A. Horton, speaking as "a Republican and a minister," denounced the tariff on coal and beef as "a disgrace to Christian rules of brotherhood and humanity." This, we suppose, will merely convince the protectionists that clergymen should keep out of politics. Only an unworldly and unpractical visionary would ever have supposed that the tariff had anything to do with brotherhood and humanity; it is, of course, purely "a business question." And finally, Congressman McCall sent a long letter, in which he denounced the duty on coal as "a miserable device of men" to deprive Canada and the United States "of a choice gift which Providence has bestowed upon them," and declared that we are attempting "by artificial contrivances to nullify the benevolent decrees of nature." If this be not the rankest free-trade doctrine that ever came from the pen of a New England Congressman, we should like to know where a better specimen can be found—for we should be glad to read it. But then, McCall always was a hopeless case. He actually believes that the wretched Filipinos have rights which the Anglo-Saxon is bound to respect, and does not hesitate to say so. Such a man would be drawn, naturally enough, into a movement to secure some recognition of the rights of those Americans who are so unfortunate as to have to buy either coal or meat.

The New Year is full of promise for the new Republic of Cuba. It finds President Palma in a stronger position than ever, owing to his firmness in putting down the Havana strike. The feeling in the Cuban Congress towards him is friendlier, and he has gained a number of supporters, despite the fact that he was forced to remove the Mayor of Havana, who did his best, it appears, to foment the strike. As a whole, the island seems to be far more orderly, particularly in the interior, than when under Gen. Wood—a circumstance that makes the refusal of the President to withdraw the last of the American troops the more regrettable. The Republic is now collecting more revenue and expending less than did Gen. Wood's government. The sugar-planting season has begun earlier than usual, and the tobacco crop bids fair to be one of the largest in the history of the island. If the reciprocity treaty should be passed at an early date, the Cubans would undoubtedly look forward to one of the most prosperous and happy years in their history.

Extracts from the annual reports of Gov. Taft and the Philippine Commission, published on Monday, give so gloomy a view of the condition of the Filipinos as to warrant all Imperialist editors in burying them as deeply as possible in the inside pages of their newspapers. Nothing said by the "pessimistic" anti-Imperialists, incredulous of the ability of the United States to administer colonies better than any other nation, can surpass the blackness of these official reports. Wasted by war and misgovernment, the islands are really in a shocking condition, many of the inhabitants being kept alive only by food supplies purchased by the Commission with the insular revenues. A locust invasion; the loss, through war and disease, of the water buffaloes upon which the rice culture is dependent; the cholera and the plague; brigandage; the pecuniary losses because of the silver standard—these are some of the reasons assigned by Gov. Taft for taking a gloomy view of the future of the islands. If the buffaloes are not speedily replaced by importations from other countries, agriculture will continue to be at a standstill. Under these circumstances brigandage flourishes, so that Gov. Taft foresees the necessity of calling upon the military for aid in certain districts, although the constabulary has thus far been able to cope in a measure with this evil. He reports that, "as the conditions grow worse—for they are likely to do so before they grow better—it will be necessary in a province like Cavité, where ladronism seems inbred in the people, to proclaim martial law, and even to call in the military finally to suppress it; but it is still hoped that it may be avoided." The only encouraging statement in Gov. Taft's message is the fact that, "since the Fourth of July last, not a shot has been fired by an American soldier." For this we may all give thanks. Gov. Taft pays a high compliment to the natural orderliness of the Filipinos by expressing his surprise at the slight disturbances in view of the terribly depressed financial condition of the islands.

By his usual methods, Addicks has secured one more supporter in the Delaware Legislature. There seems to be some little dispute whether voters in the Kent County district, where a special election was held on December 31, received $50 or only $20 each for their ballots, but nobody denies that the vote-buying by the supporters of Addicks was open and general. As a result, the Addicks man won by a majority of 192, in a district where the result in November was a tie, and where the total vote is only 800. Though he gains an additional vote in the Legislature, Addicks will hardly profit by this flagrant exposure of his corrupt practices. His strength on joint ballot will now be 23 instead of 22, but the number of votes necessary to a choice has also been increased by one as a result of filling the vacant Kent County seat. The Delaware corruptionist

is therefore no nearer an election than before, and the opposition to him must be strengthened by these latest outrages. There is nothing to indicate that a single one of the anti-Addicks Republicans in the Legislature will give way.

After weeks of agonized silence, the *Tribune* has at last found its voice about Platt—but what a voice! It says he "will be Senator," and will also be "an adviser in State affairs," thus continuing a state of things which has, it says, been "an advantage to the State." So this is what Dr. Theodore Cuyler and the other Republican clergymen and college professors and men of light and leading, who are indignant at Platt's disgraceful domination of the party, get from the old organ of decent Republicanism. They have not forgotten, if the *Tribune* has, its open charge that Platt was a corruptionist, and its bold challenge to him to sue it for libel if he dared. On April 12, 1895, it said: "The information was conveyed to us direct from Mr. Platt that . . . if we had any regard whatever for Mr. Whitelaw Reid's character, reputation, present welfare, or future prosperity, we would [should] do well to refrain from any further reference to Mr. Platt's practice of disbursing the money of the Republican State Committee by his own check and without accounting." The *Tribune* defied him then, and for many a day thereafter, pointedly observing that the boss's friends "have not yet persuaded Mr. Platt to begin a suit for libel." Its columns would furnish many more delightful excerpts in support of its sudden discovery that Platt is "an advantage to the State."

The figures given out by the Comptroller at Albany, showing the condition of the State's finances, are for the fiscal year ending September 30, 1902. They show the effect of the legislation of 1901, but not to any considerable extent that of 1902. The increase of revenue from the taxation of corporations is notable, the total for the year being $6,226,183, as compared with $4,966,680 for the previous year, an increase of $1,259,503. The fact that $380,567 was collected in organization fees from corporations forming under the laws of this State, as compared with $295,091, indicates that some advance, at least, has been made in the effort to induce new companies to incorporate here rather than in New Jersey, West Virginia, and elsewhere. The rate of the organization tax was reduced by the Legislature of 1901 from one-eighth of 1 per cent. to one-twentieth of 1 per cent. of the authorized capital stock. Of the total receipts of the State ($23,660,775), the amount from indirect sources was $16,051,353, about $7,000,000 less than the expenditures. This was the highest point yet attained for indirect revenues, but will doubtless be somewhat, though not largely, increased for the year ending September 30, 1903. Legislation proposed in 1902 for the purpose of increasing these revenues failed of enactment, notably the proposed tax on foreign corporations and the proposed recording tax on mortgages. The gap shown in the Comptroller's figures between the indirect revenues and the expenditures, therefore, indicates about what the deficit for this year will be. Last year the difference was made up by a direct tax; this year it will be made up from the surplus. The figures just made public clearly indicate why the session of the Legislature this winter must be largely occupied in devising new sources of indirect revenues if the Governor's policy of permanently abolishing the direct tax is to prevail.

Superintendent Kilburn of the State Banking Department directs attention to the tendency of trust companies to attract savings deposits to themselves, and he considers this an element of danger in times of financial disturbance. Deposits of savings banks, as he points out, are of two kinds, or rather they come from two classes in the community. One portion consists of the savings of wage workers and other persons of small means. The other consists of surplus funds of the well-to-do classes, and even of those who may be ranked as capitalists. The latter avail themselves of the facilities offered by savings banks to distribute their investments. Thus, a man or woman of large means may have deposits of $3,000 each in half a dozen savings banks. Although savings banks are not designed for this class of depositors, there is no way to prevent them from making such deposits, nor does any visible harm arise from it, unless it be the lowering of the rate of interest from the competition of capital. But the competition of capital in the loan market would not be prevented by excluding this class of depositors from savings banks; it would merely take other forms. Quite different is the danger which arises from the accumulation of savings deposits in trust companies. The danger ensues from the character of the savings depositor, who is most commonly inclined to give ear to rumors of bank disaster and to panic generally. The savings bank is empowered by law to require thirty or sixty days' notice of an intention to withdraw deposits. It is thus enabled to curb an unreasoning panic. The trust company must pay its deposits on demand, and accordingly it is destitute of the power, which the savings bank holds and exercises in cases of necessity, to check a panic. All that the Superintendent says is quite true, but the only remedy for the case lies in moral suasion—in warning the trust company not to take savings deposits and to the savings depositor to put his money in the savings bank rather than in the trust company.

About one in ten of the non-union workers in New York State joined the union ranks during the past year, as appears from an inspection of the figures submitted by the State Labor Commissioner. Such a rate of growth would need to be continued for only a few years to give the walking delegates practical control of the labor market in this State. Fortunately for those who employ labor, and for the workers themselves, this rate of increase is not likely to continue. The growing arrogance of the unions may be expected to deter self-respecting applicants for membership, and will surely stretch to the breaking-point the patience of employers. It is a warrantable conclusion that, but for its extreme views, union membership would be larger in industrial New York. In Minnesota, for instance, it is a little over 48 per cent. of those engaged in manufacturing industries and the small trades, as compared with only about 39 per cent. in this State. This showing in New York ought to encourage a disposition to resist the extravagant demands of the unions. Politicians may learn from it, too, that a majority of the workers are opposed to union tyranny, and are not to be delivered at the polls by labor leaders.

Gen. Greene has made an effective start in his new office of Police Commissioner by suspending without pay the captains and inspectors against whom there are charges pending. He has also terminated the influence of Inspector Cross, whose prominence hitherto has been a disgrace to the Administration, by making Inspector Brooks commander of Manhattan and the Bronx. Still another admirable move is his placing Inspector Cortright at the head of the entire force as chief inspector, in accordance with the recommendation of the Philbin Commission. Gen. Greene's second day in office was marked by as striking and important reforms as was his first. He remanded all the wardmen to patrol duty. At last we have a Police Commissioner who recognizes a state of affairs which is simply notorious. Gen. Greene does not hesitate to say that there is blackmailing, and that the wardmen have done a lot of the collecting. There is thus no procrastination, no waiting for "evidence" with a promise to act after careful, legal investigation. Gen. Greene's next step should be the remanding to patrol duty of the roundsmen and sergeants now attached to the staffs of the inspectors, and the reorganization of the Detective Bureau. Gen. Greene took still another excellent step in coming out strongly for a police-signal system. On the question of the liquor-law enforcement, Gen. Greene was

forced to keep silent when interviewed. He should ask himself whether the existence of so much blackmailing among the police is not in large measure due to the Administration's attitude towards enforcement.

Another outrage is about to be added to the dismal annals of monetary crimes. The Mexican Ambassador to the United States has confirmed the report that his country "is examining the question of changing to the gold standard," and it appears that some preliminary steps have already been taken in this direction. This will be sad news to the friends of silver who had looked forward to the complete rehabilitation of their favorite idol, and had believed that Mexico would never "dishonor" one of its greatest staple products and reduce silver to the position of a mere commodity, such as pork, or grain, or iron. And the worst of it is that the blow has been struck so soon after Mr. Bryan had journeyed to Mexico to study the currency problem, and to prevent, if possible, the perpetration of such an outrage. And yet, one who is able to master his sympathy for the sad fate of poor, abandoned silver can manage to take a cheerful view of the situation. Of all the countries that have remained upon a silver standard, Mexico is our best customer. In 1901 our total trade with our Southern neighbor was estimated at $65,326,000, which was more than twice the value of our trade with such a country as China. From our own point of view, it will be highly advantageous to have commercial intercourse with Mexico freed from the embarrassment caused by a fluctuating silver currency.

Wireless telegraphy threatens to remove the last resort for the nervous—the ocean steamship. Certain liners, it is announced, will not only maintain constant communication with the shore, but will issue a newspaper every day for the use of passengers. This will bring into shipboard life everything that the newspaper means. The stock ticker will compete with the mild merriment of the smoking room, branches of the famous houses of X——, Y——, and Z——, bankers and brokers, will displace the comparatively innocuous professional gambler, the latest odds on the races will be posted near the shuffle-board, a pool-room will attract those who would naturally have shone in the purser's gymkana; and the gossip of London, Paris, and New York will sustain seasick members of the gentler sex whom mild shipboard scandals leave comfortless. In fine, Mr. Marconi's invention seems likely to destroy that sense of community on shipboard by which people of diverse tastes, being forced to waive their work-a-day interests, meet upon a basis of pure sociability. Much of the glory and all of the restfulness of a sea voyage will have departed—except for those who have the time and courage to take sailing vessels, or, being millionaires, can afford to keep their steam yachts unprovided with the latest invention.

Why the Conservatives have lost fifteen hundred votes and a bye-election in the sporting constituency of Newmarket, it would be difficult to say. Presumably, the jockeys and trainers who worked for Mr. C. D. Rose, a well-known yachtsman, did not make their appeal primarily to the Nonconformist conscience. Perhaps the Government's failure to "witch the world with noble horsemanship" in the purchase of army remounts may have been cited with damaging effect by good Liberals who were also convinced horsemen. Mr. Gibson Bowles has recently caused some amusement by catching the Foreign Secretary in a mistranslation of French, and one may imagine the Liberal orators of Newmarket adopting Mr. Bowles's heckling methods, and saying of Mr. Brodrick's knowledge of horseflesh, "'e don't know 'is 'ead from 'is 'ock." Arguments like this would have distinct political value in the Newmarket constituency. But, however special the causes of the Newmarket defeat may be, there is now a sufficient record of Unionist disaster in constituencies as various as those of Kent, Yorkshire, and Lancashire to show that the Government has worn out the patience of many of its supporters. This conviction that something is amiss with the Ministry is politically quite as damaging as a more reasoned opposition.

Germany's rupture with England is now complete—poetically speaking. Wildenbruch has handed Kipling his passports. Never again shall the English poet's name be heard in Germany, announces, in true dithyrambic spirit, the favorite bard of the Hohenzollerns. Kipling is only the uncrowned—the unlaurelled—official poet of Great Britain, but Wildenbruch is court meistersinger in Berlin. The Kaiser openly praises and patronizes him, and apparently would like to make it *Majestätsbeleidigung* not to go to his stupid mediæval plays. Certainly the German people have shown that nothing but the threat of prosecution for high treason can drive them to a Wildenbruch drama. However, this poet's retort to Kipling's ode on the Goth and the shameless Hun is evidently something more than a display of courtier zeal. It is a kind of poetical mailed fist shaken across the Channel. Germany wants the English to understand that she can give as good as she gets in the way of poetical billingsgate.

The Emperor Francis Joseph reverses the usual process—instead of making his Ministers resign, he himself threatens to abdicate. The manœuvre is reported to have brought the Prime Ministers of Austria and Hungary to terms: they have agreed to prolong the *Ausgleich*, which fixes the financial relations of the two kingdoms. Whether the respective Parliaments at Vienna and Buda Pesth will be equally complacent remains to be seen. The question will occur to every one, however—If the mere threat of abdicating produces such consternation, what will happen when the Emperor dies? That is an event which, in the course of nature, cannot be long deferred, and no conundrum is harder to answer than what will then take place in the Austrian Empire. Of course, there are all sorts of rough-and-ready breakups and partitions suggested—Hungary to set up for herself, Bohemia to be a separate kingdom, the German provinces to gravitate towards Berlin, and so forth—but not one of them fails to create more formidable difficulties than it surmounts. It is possible that Europe may be so convinced of the soundness of Talleyrand's saying, "If Austria did not exist, it would be necessary to invent her," that all hands may join to preserve the *status quo* even after the puissant Emperor is gone. Yet the problem of Austria's housekeeping is clearly growing more acute with every year.

The late Señor Sagasta was probably quite as much politician as statesman. He was the War Minister of Gen. Prim, and the prop of the Bourbon dynasty during the Cuban war. His peculiar and personal form of Liberalism stood for very few political ideas, although within the present year he fearlessly enforced the laws against the religious orders. But he will probably be remembered less for his varied activities as engineer, journalist, and party leader, than for that strange chance which brought him to power on the eve of the Spanish-American war. At that time he showed himself a statesman. He accepted an inheritance of disaster with patient hopefulness; did everything to restore peace to Cuba, to quiet Spanish indignation, and to meet the ever more pressing demands of the United States. That he deserved to succeed, and that the final declaration of war was the result of the *Maine* horror, and of needless vacillation at Washington, will undoubtedly be the verdict of history. Powerless to prevent the humiliation of Spain through the loss of her colonies, he saved her from internal anarchy, and at the last appeared to turn disaster on the two oceans to the profit of the home country; thwarting personal ambitions that threatened the state, and placing the crown securely upon the head of a boy king. In the last five years of his life he showed that peculiar fortitude which any statesman must have who leads back to political health a prostrate nation.

COLOR AND CRIME.

We print in another column the reply of "W. H. B." to Professor DuBois's criticism of his misuse of the census. On examination it will be found that he has compared the figures for the entire colored population, male and female, negro, Chinese, Japanese, and Indian, with the figures for the negro male criminals. The error in this respect is of no great practical importance, except as emphasizing how perfunctory was the statistical inquiry upon which "W. H. B." assumed to base an argument against the education of nine million of his fellow-countrymen. The radical blunder which he made is, however, due to his not having taken the trouble to find out what the Census Office means by an illiterate. He supposes that the word as used in the census reports implies a person who can neither read *nor* write, when, in fact, it means a person who cannot read *and* write. He found that the census report stated that 56.76 per cent. of the colored population were illiterate. He turned to another census volume and found it there stated that 54.13 per cent. of the negro male criminals can neither read nor write. Without more ado, he felt himself justified in asserting that, in proportion to their numbers, the "educated negroes were more criminal than the illiterate." Had he read the few paragraphs preceding the tables of illiteracy in part two of the population statistics of the census of 1890, he would have found a precise definition of the term illiterate as used in those reports.

In his first letter to this journal, "W. H. B." asserted that, proportionally, the negro rate of criminality was higher in the Northern than in the Southern States. There is no question that the census reports for 1890 do show that, on June 1, 1890, there were, in proportion to the total negro population, very many more negroes confined in prison in the Northern than in the Southern States. It may be true that this fact shows that the Northern negroes are more vicious than the Southern. It is, however, by no means certain that it does. The same table shows that, on the same day, June 1, 1890, out of every million inhabitants of Massachusetts, 2,335 were prisoners, while only 531 to the million of the inhabitants of North Dakota and 590 to the million of the inhabitants of West Virginia were similarly confined. It would be a rather rash man who, on this basis, should assert that the people of Massachusetts were four times as bad as those of North Dakota or of West Virginia. Moreover, the same table shows that only 1,421 to the million of Mississippi negroes were imprisoned, while, as before stated, there were 2,335 prisoners to the million of population in Massachusetts. If "W. H. B.'s" reasoning is sound, it follows that the average Mississippi negro has fewer criminal propensities than has the average resident of Massachusetts, black or white. It will be also rather hard to explain why it is that, while, to every million of Mississippi negroes, there were only 1,421 prisoners, there were 3,086 to the million in Alabama, and 3,022 in Georgia. The fact is, that the methods of administering criminal justice and the provision of reformatories, jails, and penitentiaries differ so widely in the different States, that any comparison between the criminal statistics of the different sections of the country based merely on the number of people in each of them who are in prison on a particular day, are absolutely worthless. There is, of course, no doubt whatever that, in proportion to population, more negroes than whites are convicted of crime. There can be little question that more negroes than whites commit crime. It is practically certain, however, that the difference in the criminal propensities of the two races is exaggerated rather than represented by the statistics of convictions, and would be exaggerated rather than represented by those statistics even if they were always accurately compiled, and compiled in such a way as to make comparisons more practical and easy than they now are.

It is not probable that many innocent negroes are convicted of offences which they did not commit. Such convictions sometimes take place, as they sometimes take place in the case of innocent white men. They probably take place somewhat more frequently among negroes than among whites, and this for two reasons. In the first place, the negroes as a class are poor and without influential friends. The innocent white men who are convicted of crimes they did not commit, are almost always poor and without influential friends. There being relatively more negroes than whites who are in that unfortunate condition, the chances of an innocent negro being convicted are greater than of an innocent white man. Secondly, the factor of race prejudice in this and other matters cannot be ignored. It is not that a white jury ever deliberately convicts a negro of an offence which they do not believe he committed, but it is because, unconsciously to themselves, very much less evidence will satisfy an ordinary white jury that a negro has committed a crime than is required to convince them that a white man has done the same thing. In short, their state of mind is very like that of "W. H. B." He would never have made the assertion that education made white men criminals unless his study of the subject had been so complete and thorough as to leave in his mind no room for a possibility of doubt that he is right. A mere hasty glance at a couple of tables was quite sufficient to satisfy him that education did tend to turn negroes into criminals.

Then, many times white men commit crimes for which they are not convicted, or, if convicted, are sentenced to lighter terms than are imposed upon negroes for similar offences. A very small proportion of the white men in this country, North or South, who commit a premeditated murder, are capitally punished for the offence. In some portions of the country, such, for example, as the mountain regions of Kentucky, any punishment for such offences is relatively rare. It is probable that the greater number of negroes who are guilty are punished, and not infrequently to the full extent of the law.

No one who has had any experience with the practical administration of criminal justice, can doubt that people who have influential connections, of one kind or another, are less frequently and less severely punished for crimes committed by them than are those people who have no such connections. It is not merely or chiefly what may be called a clearly illegitimate exercise of political or personal "pull" that produces this difference. The causes are more diverse and more subtle. A young man commits an offence, perhaps a serious one. He or his people have friends of respectability and more or less influence. These friends see the prosecuting witnesses, and press strongly upon them the possibility that, if this offence be overlooked, a worthy citizen may be saved to the community and the family spared permanent disgrace. In very many instances considerations like these prevent any prosecution at all. Even after the prosecution is begun, similar representations to prosecuting officers often lead to an entry of a *stet* or a *nolle prosequi*.

Often this failure to prosecute or to carry on the prosecution to the point of trial is not only merciful but wise. It still remains true, however, that such wisdom and mercy are very much more likely to be displayed in the case of those who have intelligent and influential friends to speak for them than in the case of the poor and friendless. When a criminal case is brought to trial, the offender who has money enough to procure good counsel, or who has friends enough in the community to create more or less sympathy for him, stands a very much better chance of escaping conviction, though guilty, than do those unfortunate members of the community who, though no more guilty, have no such assistance rendered them. The extreme poverty of the negroes as a class compels those of them who live in cities especially, to leave their children at a very early age practically without parental supervision or control. When, as is common, both mother and father are out at domestic service, or at other employment which takes them from their homes for long hours together, the children from a very early age are left to their own resources.

After all such allowances are made, it

is not improbable, however, that there is a greater tendency to crime in the American negro of to-day than in the American white man; but the difference is much less than the statistics of conviction of crime would indicate to be the case.

WORK FOR A REAL "WORLD-POWER."

We had so fondly hoped, because we had been so loudly told, that the United States became a "world-Power" when it whipped enfeebled Spain, that we can but rub our eyes to find Europeans saying that we have only now attained that dignity. And, perversely enough, they acribe it to our having, not gone to war with some one half our size and smashed a fleet, but having kept the peace! It is the firm and successful stand of this country for arbitrating the Venezuelan dispute which makes us thought of with more respect than ever in those very lands where the heart of military glory was long ago plucked out, to use Rosebery's phrase. The French dispatches speak of the great admiration felt everywhere on the Continent for President Roosevelt as a peacemaker. It is our exaltation of peace which has heightened our prestige, and our success in causing arms to yield to the august verdict of the Hague Arbitration Tribunal which has made us bulk larger in the eyes of the world.

We should not let this Venezuelan incident, which we have made a national triumph, swim from our ken before we have read in it the moral that lies writ there for all who have eyes to see. This renowned victory of peace has been won on principles which are a standing refutation of what we have been doing elsewhere for four years past. In Venezuela we have done what we said could not be done in the Philippines. In behalf of aliens we have dared greatly, and have encountered risks which we said could not be faced in behalf of our own subjects. One has only to recall the two main reasons given for our course in the Philippines to see that they applied with equal force to Venezuela. If they could safely be disregarded in the latter case, so they could in the former.

These two reasons were (1) that if we should withdraw from the Philippines the rapacious Powers would pounce upon them; and (2) that, but for the presence of our flag, the islands would fall into "anarchy," and the United States could never be responsible for an anarchist government. Who does not remember the awful pictures drawn of the navies of Europe speeding to the prey in case they once saw us leave the archipelago? Why, the land-grabbing Powers were only waiting for the signal! Each of them had its favorite island picked out in advance—Japan had her eye on Mindanao, Germany would never be happy till she got Cebu, England would, of course, slip over in the night from Hong-Kong and annex Luzon. Among so many islands, there would be something for every one; and our alarmed Imperialists saw them already parcelled out. The European nations simply could not resist the chance to take good land away from the weak Filipinos. Hence how clear our duty, having taken it ourselves, to follow the good old rule of conquerors, and say with Charles XII., "The Lord has given and the Devil shall not take away."

Well, gentle Imperialist, do you not see now the significance of what has happened in Venezuela? There you had your weak and defenceless country. It was like a tethered lamb before the lion and the eagle. But did they rush upon it? No; the United States told them they must not, and they did not. Ah, but that was the Monroe Doctrine! Let us, however, clear our minds even of Monroe cant. The Monroe Doctrine is, in the last analysis, nothing but our wish and will. It has no standing in international law. It is simply *Sic volo, sic jubeo.* And we could just as successfully will and command in the case of the Philippines as in the instance of Venezuela. Of course, we said at the time that we could not. Our leading Jingoes among the prophets assured us that an American protectorate over the Filipinos was impossible. A predatory world would not respect it. But we could make it, in the East as well as the West. The Monroe Doctrine is elastic enough, we'll be bound, to stretch across the Pacific in case of need.

Then there was our dread of Philippine "anarchy." Venezuelan anarchy, however, we have shown ourselves perfectly ready to stomach. If any chaotic government ever had a name to live anywhere, it has existed for nearly a century on the shores of the Orinoco, if Venezuelan historians have written their own annals true. "Mean and bloody" has that history been, as President Roosevelt has said. From Blanco to Crespo, at least, the Venezuelan Government has been in the hands of an ever-changing oligarchy of adventurers and usurpers and tyrants. It is precisely because of rampant anarchy in Venezuela that Great Britain and Germany proposed to interfere. But we, to whom an imagined Philippine anarchy was a nightmare, stood up for the actual Venezuelan anarchists like brothers beloved, and maintained that, as Mr. Roosevelt has said, it was infinitely better that they should be left to develop along their own lines than be interfered with by an alien Power.

We will not labor the point. Were not the art of contradiction as glorious in power to-day as it was in the time of Socrates and Glaucon, we should expect all reasonable Americans to agree that what we have done in Venezuela—and, we may add, in Cuba—we could have done in the Philippines. We assert, for our part, that it is a work we yet ought to undertake. To cry "Hands off!" for a feeble folk in the isles of the Pacific; to give their strong national sentiment an opportunity to expand in conformity to its own type; to place them under the ægis of the American republic and the Hague Tribunal—there you have work right worthy of a real world-Power.

THE PHILIPPINE CURRENCY BILL.

Just before the holiday adjournment of Congress, Senator Lodge reported from the Committee on the Philippines a bill (S. 6357) to regulate the currency of the islands. It provides, first, that the gold peso, equal to a half dollar of our money, shall be the unit of value, but does not provide for any gold coinage. Instead of that, it makes the gold coins of the United States legal tender in the Philippines at the rate of one dollar for two pesos. Next, it provides for a silver peso of full legal tender, to be coined from bullion bought by the Government, and of which the Government must coin twenty millions, and may coin seventy-five millions. Thirdly, it provides for subsidiary silver coins to be legal tender for ten dollars.

The effect of this measure is to establish in the Philippines what is called the "limping standard"—a phrase applied to countries which have the gold standard nominally, but also have a large amount of silver of full legal tender. Germany, France, and the countries of the Latin Union are in this category. The United States is in the same category. None of the countries named consider the condition a happy one. The European nations took the limping standard because they could not help themselves. They caught it, as people catch the measles. They had large amounts of silver in circulation in the early seventies, when the gold standard asserted itself over the civilized world, and they could not get rid of it. Germany made great efforts to sell hers, and did dispose of a part of it. In doing so she broke the price of the metal so that when the Latin Union countries decided to stop coining silver, they had no market on which to sell theirs. The United States is the only country which took this kind of measles voluntarily. We took it with our politics, but no political party is very proud of it now; nor shall we have any reason to be proud if, after our experience with it and our knowledge of it in other lands, we inflict it upon a people who are under our legislative control.

The great objection to the limping standard is its uncertainty. Those who are under its régime never know where they may stand a year hence. A bill is now pending in Congress to remove the

uncertainty which the limping standard entails—a bill to provide for the redemption of the silver dollar in gold. The act of March 14, 1900, recognized the uncertainty by a clause requiring the Secretary of the Treasury to keep the silver dollar at par with the gold dollar, but did not provide him with any means to do so. Senate bill 6357 recognizes the same uncertainty attaching to this system in the Philippines, by authorizing the Government of the islands to adopt such measures as it may deem proper to maintain parity between the gold and silver coins, and to borrow ten million dollars gold for that purpose. This clause of the bill expresses the fear of its framers that the equilibrium of the standard will not be maintained without extraneous and extraordinary efforts.

Looking at the details of the bill, it is very doubtful whether parity can be maintained if the Government of the Philippines exercises all the powers conferred upon it. It must coin twenty million, and it may coin seventy-five million silver pesos of full legal tender, at the ratio of 32 to 1, while the market ratio of silver to gold is 43 to 1. The line of prudence and safety under the limping standard lies in keeping the amount of the overvalued money (the silver pesos) no greater than the retail trade of the country can absorb, but the temptation will be ever present to overpass the limit. We know how this is ourselves. Unless the Philippine Government is wiser than the Washington Government was, we may expect to see the limit overpassed as it was under the Sherman act.

In devising a new monetary system for the Philippines, the simplest plan is the best. The gold standard, as provided in the bill before us, with a silver subdiary coinage of the kind provided in the act passed by Congress last year, is quite sufficient. There is no good reason for thrusting in a third kind of money, whose sole virtue will consist in its redemption in gold. These pesos would be both an element of danger and a needless expense. As the bill provides for issuing paper certificates for them like our silver certificates, why not issue the certificates in the first instance? The pesos are to circulate on the credit of the Government, not on their intrinsic value. Our silver certificates would circulate just as well, perhaps better, if there was not a dollar of silver behind them. If the Filipinos prefer to handle silver rather than paper, give them plenty of half pesos, which the bill also provides for. The natives probably know that two halves are equal to a whole one.

As the pesos are quite unnecessary, the only visible object in coining them is to make a market for silver bullion. We trust that the Senate Committee is not now trying to "do something for silver" at the expense of the Filipinos, but we recall the fact that the Senate bill of the last session did have that aim, since it contained a clause that the coins might be made at our mint, but that the silver bullion so coined should be of American production.

We are told by some people that if we introduce the single gold standard we shall increase the wages of labor in the islands. That depends upon the ratio between gold and silver which may be taken as a starting-point. Wages in the Philippines, although nominally the same as of old, have been actually reduced by the decline in the value of silver. The laborer who gets a peso in wages, cannot buy so much with it as before. As regards future wages, the question is, What shall the future peso be? The bill says it shall be an amount of gold equal to half of an American dollar. That is the ratio of 32 to 1. It is a fair starting-point, since it was the market ratio when we took the islands. It was the ratio actually adopted by Japan in the same year. There has been a fresh drop in silver within a few weeks, which has cut the effective wages of labor still lower. The Filipino laborer has been thrown down by the force of circumstances, and Congress ought not to hold him down, but rather to lift him up and put him on his feet, especially since Congress neglected its duty in this particular, last summer, when it might have avoided the major part of this trouble.

THE ARTS OF THE EAST.

Lord Curzon, addressing an audience of native princes at the opening of the Indian Arts Exhibition at Delhi, urged these leaders of Indian opinion to stand by their own beautiful art. He deplored the tendency to adopt European fashions of furnishing merely because they are European, and showed that the future of the finer industries of India depends upon the presence of a body of intelligent patrons who will hold artist and craftsman to their best. An amusing sequel of this speech is the protest of the Tottenham Court Road furniture dealers, who blame Lord Curzon for discouraging the furniture trade with India, and convict him of purchasing in quantity the English fittings which he bids the princes of India eschew. But the furniture dealers of Tottenham Court Road will hardly be accepted as referees of the questions—Is it desirable to preserve the arts of the East? and, What are the conditions of their preservation?

When Théophile Gautier said that no Western nation could make a carved saddle, he caught a striking symbol for the arts of the East. These arts are, first of all, applied to the ordinary uses of life—the rug for prayer, the tent, the saddle cloth, the enamelled lantern, the tiles on the floor, the pottery for household uses, the brass or bronze utensils of ordinary service. These are the characteristic products of Asiatic art. These things have become the marvel of art lovers throughout the world, through a peculiar skill of which Western workmen have lost the tradition. The cumulative habits of a thousand years alone make possible the certainty of the Japanese ivory-cutter's knife; the peasant rug-maker of Persia and Asia Minor has a knowledge of color effects more subtle and correct than that of our greatest painters. In every branch of art, immemorial training has perfected the work of brain, and hand, and eye, so that in comparison with, say, a scrap of a Persian tile, our best pottery seems tentative and amateurish. It is this accumulated knowledge of beautiful ways of doing things that Lord Curzon begged the Indian vassals of England to cherish.

The future historian of Eastern culture will have a somewhat melancholy chapter to write on the decline and fall of Oriental art. He will show how the Western nations, among whom machine work had destroyed handicraft, filled the East with Brummagem manufactures. He will explain how the West dealt the East a still more crippling blow by requiring of the Eastern artist the work of the Western machine. The people of the nineteenth century, he will say, asked of China, Japan, India, Persia, Asia Minor, not their best, but their worst—anything, so it bore the tag Oriental. Under this foolish demand, he will explain, the art of rug-making virtually disappeared from the Asian villages, while the potteries of Japan gave themselves to caricatures, "for export," of their older and finer products, and Japanese painters cast away the beautiful linear symbolism to the perfecting of which centuries had gone, and gave themselves to meaningless imitation of the painting of Paris.

A very few years will decide the fate of the apparently moribund arts of the East. Unquestionably, machine-made products will there, as elsewhere, increasingly replace the direct work of the artist's hand. Does this mean that beautiful handicraft is to perish out of the East as utterly as it has done out of the West? Lord Curzon thinks he sees a remedy in the revival of national spirit and taste in the East itself. And, clearly, the redemption of Eastern art must come in this way, or not at all. The artist artisan does his best only for the patron of his race, from whom he may count upon complete appreciation. The patronage of foreign connoisseurs is, on the whole, demoralizing to the craftsman. He distrusts their knowledge, and scamps his work for them—as a glance at the French painting made expressly for the American market will prove. The real danger to Eastern art, then, lies in the reaction of Western civilization upon

the men of wealth and station in the East. When the Indian prince becomes an Oxford man and a cricketer, he usually accepts the worst English standards—replaces his century-old rugs with Brussels carpet, and his carved teakwood with the gilt lacquer of the shops. Similarly, the Japanese has a tendency to become a vague New Yorker or Parisian. Thus he is unsettled in his own tastes, while he hardly acquires a sense for European art.

In fighting against that levelling tendency which is making the top hat the sign of gentility the world around, one is not merely tilting quixotically in behalf of the picturesque. There is a deeper principle at issue than the æsthetic preference for a turban over a derby hat—namely, that of intelligent nationalism. If the brown and yellow men of the East consent to be made over after the image of John Bull and Brother Jonathan, we shall have not only a less interesting world, but a less efficient world. No one, who realizes how much diversity of national life and thought has meant to the history of mankind, can wish to see the world peopled by Europeans and intellectual hybrids.

IS COLOR-BLINDNESS PREVENTABLE?

At a recent meeting of the British Ophthalmological Society, Dr. F. W. Edridge-Green brought forward some new facts of vital importance to the owners of railway and steamship lines, as well as to the travelling public. As a specialist on the subject of color-blindness and a member of the International Code of Signals Committee, he had pointed out, some years ago, that the Government tests for color-blindness were still insufficient, and the enforcement of regulations too lax. He predicted that if color names were ignored in the Board of Trade tests and reliance placed solely on the Holmgren system of matching colors, normal-sighted persons would be rejected; and this prediction was, he said, fulfilled. More than 38 per cent. one year, and more than 42 per cent. another year, were found to be normal-sighted and to have been wrongly rejected. He emphasized the fact that an engine-driver or sailor had to name a colored light when he saw it, and not to match it. At the same meeting Mr. C. Devereux Marshall remarked that it was most striking to find a person who could pass Holmgren's test with ease, declaring that a dull red light, which was quite visible to a normal-sighted person, did not exist at all, and that the room was quite dark. Persons with a shortened-red vision were, he added, sources of the utmost danger when placed in responsible positions, either at sea or on the railway.

It is, therefore, more than probable that the regrettable fact that 158 passengers were killed and 2,436 injured by train accidents in the United States in 1901, is related in some cases to the general reliance on the Holmgren matching system. It will be desirable to revise the system of examination in accordance with Dr. Edridge-Green's latest experiments. The small sum spent on color examinations by the best-managed companies may be regarded as a cheap form of insurance against loss of rolling-stock and damage suits.

In sailors, color-blindness is an even greater menace than on the railways, and increasingly so with the growing speed of steamers. A seaman must be able to distinguish between red and green at a distance of at least two miles. There is every reason to think that if a list could be made of all the collisions since 1852, and the lives lost in consequence of the color-blindness of sailors, it would be appalling. Since it has been found that about one man in every twenty is color-blind, it follows that wherever tests for color vision are enforced, five out of every hundred applicants must be rejected, although they may in all other respects be the best five of the hundred who apply for the job. For these, and various other reasons, it would be an obvious advantage if color-blindness could be cured or prevented. No great harm is done if an occasional clergyman or venerable Quaker orders bright green or vivid scarlet material for a gown, or if a farmer is unable to tell strawberries from the surrounding leaves except by their shape. Nor is it likely to occur very often that a cashier gives gold thinking it silver, or that a stamp seller cheats himself or others. But it is said that silk dealers have to do with about 2,000 different colors and shades, and it is likely that in this business, and many others in which colored objects are handled, much confusion, error, and loss results daily from the imperfect color sense of some employees. Æsthetically, too, there is certainly a disadvantage in seeing rainbows colorless and in missing the glories of sunsets.

In a lecture delivered before the Royal Institution of Great Britain twelve years ago, Dr. Brudenell Carter declared that the condition of color-blindness is absolutely incurable and incapable of modification by training or exercise in individual cases. This discouraging view has prevailed generally, although the interesting fact that only one or two women in a thousand have a defective color sense was known, and was generally accounted for by the fact that females, from their infancy, pay more attention than boys do to finery—fancy-work, flowers, feathers, ribbons, and gaudy dress in general. It has also been known for some time that, in the case of civilized races, color-blindness is more frequent among the poor than among the wealthy and better educated. This suggests that training has something to do with reducing the number of cases. If it were simply a question of mental evolution in general, we should find the defect specially prevalent among savages and barbarians. As a matter of fact, it is rarer among them than among civilized men. Of the Indians examined by Blake and Franklin of Kansas University, only one in a hundred was color-blind. Even if we agree with those who maintain that Indians are not æsthetically interested in flowers, trees, feathers, and the various ornaments they wear, we can but surmise that their constant ceremonial use of these things, and their need of a fine color sense as an aid in hunting and fighting, gave them their superiority to us in this respect as in regard to acuteness of vision.

Fresh evidence in confirmation of the view that color-blindness is capable of modification, or rather prevention, in individuals, is provided in the *Educational Review* by Alida S. Williams. Holding that this defect is not the result of retinal imperfections, of brain lesions, or of some mysterious freak of inheritance, but simply of insufficient color training in childhood, she recently tested this view by examining, in one of the primary schools of this city, 580 boys whose ages ranged from six to twelve years. These boys had received the careful systematic color-training now given in our public schools to children of both sexes, and the result was that, instead of the twenty-four cases of color-blindness to be expected according to the current belief, there was only one, and that one yielded to special treatment. The boys delighted in the brilliant hues placed before them, and convinced the writer that it is "not only unwise, but unkind, to starve a child's color sense." The result obtained is of value, not only with reference to the marine and railway service of the future, but as suggesting the important educational question whether there may not be other perceptive weaknesses in adults which might be prevented by the proper training of the senses in the impressionable days of childhood.

AMERICAN HISTORICAL ASSOCIATION.

PHILADELPHIA, December 30, 1902.

The eighteenth annual meeting of the American Historical Association was held at Philadelphia December 26-30, being the first visit of the Association to that city. The experiment of holding over a Sunday, initiated at the Washington meeting in 1901, was repeated this year. The attendance throughout was the largest yet recorded, though it seems inevitable that but a small percentage of the membership will be represented at any annual meeting. The general arrangement of the programme followed the plan observed for several years past—two joint sessions with the American Economic Association, and a business session, besides the meetings for the reading of papers. The new feature was a special

session devoted to international law, in this instance given up principally to papers concerning the Isthmus of Panama and the interoceanic-canal project. The papers submitted, while without exception interesting and valuable, were as a whole less striking than has sometimes been the case. Perhaps the extreme tardiness with which the annual reports of the Association appear, together with the increased facilities for the publication of historical writing in other directions, tends to make the annual meetings a less inviting forum for the presentation of historical work of the first importance, while the almost entire disappearance of public discussion takes from the proceedings an element of interest formerly much more in evidence.

Of the papers read, three, if one may judge by the discussion of them in social meetings of the members, aroused particular interest. Prof. J. F. Jameson of the University of Chicago, in a paper entitled "Letters from the Federal Convention of 1787," presented one of a series of studies of the Convention, in which the inner history of that remarkable body, as contained in the correspondence of the members, was somewhat more fully revealed. Prof. C. A. Duniway of Leland Stanford, in a paper on "Diplomacy and the Withdrawal of the French from Mexico," went far towards discrediting the idea that it was pressure from the United States that primarily compelled the French withdrawal. The evidence adduced by Professor Duniway seems to show pretty clearly that the withdrawal of the French troops had been already decided upon for other reasons, chiefly European, and that the United States seized the "psychological moment" to cast its own weight into the balance, and win thereby the credit for the abandonment by France of the Mexican enterprise. The paper was an important contribution to the somewhat devious history of later American diplomacy. A paper by Prof. William MacDonald of Brown, on "A Neglected Point of View in American Colonial History," was an earnest protest against the too common isolation of our colonial history, with its excessive attention to local and antiquarian details, and a plea for the study of the period primarily as the history of English colonial policy in America. Such a change of emphasis, it was pointed out, would recall attention to the superior commercial importance, throughout the colonial period, of the West Indian sugar colonies, show the part—practically forgotten now—played by the colonial governor and colonial agent, awaken a new interest in the historical development of American law, and perhaps be not without instructive bearing on our own dangerous colonial experiments.

Of the other papers read, the most noteworthy were: "The American of 1775," by Mr. James Schouler, interesting, among other things, for its light on the late persistence of slavery in the Northern colonies; "The Art of Weaving—a Handmaid of Civilization," by Mr. William B. Weeden, a wholly competent authority; "Municipal Problems in Mediæval Switzerland," by Prof. J. M. Vincent of Johns Hopkins; "American Constitutional Principles in the Constituent Assembly," by Prof. H. E. Bourne of Western Reserve, an instructive study that might well be followed up; "Party Politics in Indiana during the Civil War," by Prof. James A. Woodburn of Indiana University, read in part only; and "American Business Corporations before 1789," by Judge Simeon E. Baldwin of Connecticut, a sound and thoroughgoing piece of work in a rich but little tilled field. Three papers read by title will appear later in the published report. Of the eighteen papers presented, twelve were on subjects in American history. The church-history section appears to have been suspended, but two of the papers read by title were on ecclesiastical topics.

The manifold activities of the Association wax greater and more numerous year by year. With a membership of over 1900, the Association is enabled to carry on a wider range of scholarly work than is attempted by any other scientific body in the country. The *American Historical Review* continues to be an historical as well as a financial success; the editors noting particularly a gratifying increase in the number of articles submitted on subjects in European history. The report of the Historical Manuscripts Commission for the year comprises, among other papers, the letters of Salmon P. Chase during a part of the time in which he was Secretary of the Treasury. The Chairman of the Commission, Prof. E. G. Bourne, expressed the opinion that the Commission would probably find its most appropriate field hereafter in the field of American diplomatic history. The report of the Public Archives Commission contains accounts of the State records of Illinois and Oregon, and of the Bexar archives in the possession of the University of Texas, while reports on the archives of Maryland and California, and on the records of the Revolutionary counties of North Carolina, are in active preparation. Professor MacDonald relinquishes the chairmanship of this commission after three years of service, Dr. Herman V. Ames of the University of Pennsylvania being added to the commission and designated as chairman. The Justin Winsor prize was awarded this year to Mr. Charles McCarthy for a monograph on the Anti-Masonic party. The number of manuscripts offered in competition for this prize shows gratifying increase, but the committee of award has still to plead for manuscripts better put together and more legibly written. The bibliographical committee shows hopeful signs of activity, and proposes not only the publication of such bibliographies as are submitted to it—elaborate ones on Louisiana and Florida are in a forward state—but also the preparation of both general and special bibliographies particularly needed by students. Of new industries the Association proposes this year but one, but that of great importance, namely, the reprint, in carefully edited but inexpensive form, of leading narrative sources of American history. No project yet launched seems likely to contribute more to the spread of historical knowledge, particularly among persons and communities denied access to large libraries and costly editions, than this. The undertaking, to be carried through as a commercial enterprise without cost to the Association, was given into the charge of a committee, who will choose a general editor.

Notwithstanding, however, its wide influence and obvious success, the Association has still to solve problems of some seriousness. The rapid increase of membership, embracing as it does many persons only slightly interested in historical studies, tends unavoidably to obscure somewhat the scientific character of the organization, and to give it something of the character of such great popular bodies as the National Educational Association. The unequal distribution of members over the country, too, raises annually the question how far the Association should be a roving body or act the part of a missionary for those sections, like the South, where its representation is still small. For the moment the missionary star is in the ascendant, as is witnessed by the decision to hold the next meeting in New Orleans. On the other hand, the announced purpose of members on the Pacific Coast to have an affiliated section of their own, together with the unmistakable feeling on the part of students and teachers of political science that their interests are not sufficiently served by the existing organization, point to the possible dismemberment of the Association in the near future, and the formation of separate societies for particular sections or subjects. Where lines of work necessarily cross each other at so many points as do those of history, government, and administration, the formation of separate organizations would seem in every way regrettable, but the remoteness of the Pacific Coast States, where the Association is strong, presents a different problem. The executive administration, too, has hardly kept pace with the growing needs of the Association, and the provision this year for an additional meeting of the council annually hereafter might well have been made some time ago.

Never has the Association been entertained with such lavish hospitality. The University of Pennsylvania, Drexel Institute, the Historical Society of Pennsylvania, and the American Philosophical Society vied with each other in extending welcome to their guests, while the University and New Century Clubs generously offered a much appreciated accommodation. Of social courtesies of a private or personal sort there was literally no end. It seems, perhaps, ungenerous to suggest that the social side of these annual gatherings has been, in recent years, a bit over-emphasized, and that a simpler fare might please better a good many to whom so incessant a social round is, after all, somewhat distracting. On the other hand, no organization which is not believed in and highly regarded is likely to receive, unasked, such a kind reception as was accorded the American Historical Association at Philadelphia; and that the Association is both believed in and highly regarded is, happily, abundantly evidenced at each recurring annual meeting.

THE ECONOMIC ASSOCIATION AT PHILADELPHIA.

PHILADELPHIA, December 29, 1902.

The characteristic features of the fifteenth annual meeting of the American Economic Association, held here during the past four days with the University of Pennsylvania, were a large and representative attendance, a brilliant Presidential address, and a local hospitality so cordial and so unremitting as to leave the recipient gasping.

For the fact of large attendance, the Association's policy, now more or less definitely established, of a common meeting

place and one or more joint sessions with the American Historical Association, is in considerable measure responsible. The relation of the two sciences in personnel and in scientific activity is so intimate that a joint place of meeting, with the practical certainty of reduced railway rates, often becomes a determining consideration in the case of members hesitating as to attendance. But the larger circumstance responsible for a successful meeting of American political economists at this particular time is, of course, the extraordinary development of economic study in the United States. It has become almost a commonplace to prophesy that the scientific leadership in economic inquiry, which two generations have seen pass from Great Britain to Germany, will ultimately reside in the United States. Evidence of this significant aspect of "America's economic supremacy" presses on every side—newly established professorships, larger student bodies, additional courses of instruction, increasing avenues of publication, an enthusiastic body of young investigators forging to the front in keen emulation, and, best of all, a growing influence of expert economic opinion in the formulation of public policies and in the administration of public affairs.

The first session of the meeting, held with the historians on Friday evening in the beautiful auditorium of Drexel Institute, was devoted to the Presidential addresses. Capt. Mahan of the Historical Association spoke on "Subordination in Historical Treatment," and Professor Seligman of the Economic Association discussed "Economics and Social Progress." Mr. Joseph Wharton, Chairman of the Local Reception Committee, welcomed the two bodies. President Seligman's address may be regarded as a sequel to his noteworthy paper on "The Economic Interpretation of History," presented at last year's meeting, and since expanded and published in book form. "Relativity, not absolutism; change, not permanence—is the watchword of all social, political, and ethical progress." This sentence was the keynote of the address. Beginning with emphatic statement of the essential relativity of all economic thought and all political doctrine, a striking interpretation of certain phases of American history was presented. New England democracy was described as the result, not of Puritan ancestry, but of economic conditions, while similarly the individualist theory in America was characterized as the product of definite economic conditions in the nineteenth century, the passing of which is now in turn undermining the theory of extreme individualism. In this sense—

"American history has been the history of national infancy. To predict a future which shall be a necessary development from our early past, would be as childish as to explain the conditions of Roman imperialism from the facts of the pre-republican age. While the stubborn racial characteristics must, indeed, not be overlooked, the American of the future will bear but little resemblance to the American of the past. To forecast the coming social transformation in our country without bearing in mind the fundamental change in the economic conditions, were puerile indeed."

Such recognition of economic forces in our past national development is the surest safeguard against that pessimism which sees in our present unquestioned prosperity the beginning of future decay and final dissolution. Modern industrial society is differentiated from all its predecessors in the practical exhaustion of free land, in the predominance of industrial capital, in the application of scientific methods, in the existence of a competitive régime based on the newer conception of liberty, on the spread of education and the birth of a distinct public opinion, and in a true democratic spirit and the growth of a new idealism. These conditions ensure a continued increase in the productive powers of society and an inevitable tendency to secure to each class in the community its proper share in the national dividend. But this outlook should not encourage fatalism. With the subordination of the individual to the social interest, to the advantage of individual and society alike, there is an ever enlarging field, and ever more pressing need for the wise regulation which will result in a more even, more equable, and more harmonious development. And herein lie the rôle of economic theory and the mission of the economist.

Saturday morning's session was devoted to a discussion of the public regulation of railroads, and gave rise to the liveliest debate of the meeting. Charles A. Prouty of the Interstate Commerce Commission presented the case for a more effective national regulation, taking the ground that the main feature of the railway problem is no longer discriminations, but actual and possible extortions in rates, that effective regulation accordingly demands the establishment of a commission with power to adjust rates, subject to review and enforcement by special tribunal or commerce court. Vigorous dissent from these conclusions was made by Walter D. Hines, Vice-President of the Louisville and Nashville Railroad, who argued that the Interstate Commerce Commission is neither an expert nor an impartial tribunal, as is proved by its decisions and the action of the courts upon them. It is unnecessary, unwise, and unjust, to give such a tribunal practically final power over the private capital invested in railroads. At present the mistakes of the railroads can be adequately corrected in the courts; under the proposed method, the mistakes of the Commission could not be corrected anywhere. Prof. E. R. Johnson of the University of Pennsylvania, Prof. B. H. Meyer of the University of Wisconsin, and J. Shirley Eaton, statistician of the Lehigh Valley Railroad, continued the discussion along stimulating and profitable lines.

A more pacific tone dominated the third session on Saturday afternoon, devoted to economic theory, with principal papers by Prof. J. B. Clark of Columbia University, and C. W. Macfarlane of Philadelphia. Professor Clark presented the first fruit of his eagerly awaited studies on the dynamic theory of distribution in an acute paper on "The Dynamics of the Wages Question." Wages are always tending toward a standard fixed by the productive power of labor, and this standard rises as the productive power of labor increases. The actual pay of labor also rises, but it lags behind the standard by a certain interval. Whenever this interval grows larger in consequence of a change that raises the standard towards which wages are tending, labor is benefited; but whenever the interval is enlarged by an influence that thrusts the pay of labor downward or retards its natural rise, labor is, of course, injured. The latter part of the paper was devoted to a subtle analysis of the influence of monopoly upon the approximation of the actual to the standard wage. Mr. Macfarlane's paper on "Distribution by a Law of Rent" was a closely reasoned examination of the arguments by which Professor Clark has elsewhere endeavored to show that interest and wages may be reduced to a differential or rent form.

The fourth and fifth sessions on Monday morning and afternoon, respectively, were devoted to a discussion of the problems and aims of organized labor, and were on the whole disappointing in quality. This was due in part to the absence of John Mitchell, Dr. Felix Adler, and Prof. George Gunton, who were to have contributed to the debate. But even those papers which were presented and the discussion which they occasioned failed in any degree to satisfy, and possessed at best a "documentary" value. A paper on "The Union Shop," by Henry White of the United Garment Workers, was a calm, forcible presentation of the labor side that contrasted favorably with a remarkable literary production of Frank K. Foster of the Massachusetts Federation of Labor. Altogether, the discussion impressed the thoughtful mind with the utterly inadequate basis upon which current generalizations on the labor question are made, with the urgent need of detailed scientific study of the history, structure, and functions of labor organizations in the United States.

The final session of the meeting on Monday evening was again held with the historians, with "Currency Problems in the Orient" as the principal topic. Prof. J. W. Jenks of Cornell University reviewed the recent currency experiences of India and the Far East, and concluded that the introduction of the American standard in the Philippines would probably result in a decided cutting in wages and a sudden fall in prices, which would doubtless have a somewhat seriously demoralizing effect. On the other hand, if we were to adopt the plan now proposed in Congress, of using the silver peso—not materially different in weight from the Mexican dollar, to which the natives are accustomed—with a fixed value equal to that of half an American dollar, the chances are that this peso would practically take the place of the Mexican dollar. Under these circumstances, there would probably be a slight increase in wages as well as a slight increase in prices of products, but on the whole the change could be made with practically no shock to business and with the gain rather to the Filipinos than to the larger dealers. G. Bruce Webster, New York agent of the Chartered Bank of India, Australia, and China, inclined to the retention of the silver standard in the Philippines, but, short of that, favored a plan akin to the one outlined above. Charles A. Conant presented anew the arguments for the system of insular currency associated with his name. Horace White sounded a warning note against introducing "the limping standard," with its recognized defects and inconveniences, into new territory.

The officers of the Association reported a gratifying increase in membership, a satisfactory condition of the treasury, and an encouraging growth in scientific effective-

ness and in practical usefulness. The difficult question of publication policy was discussed at length and finally referred to the Executive Committee, with instructions to formulate a plan for presentation at the next annual meeting. Professor Seligman was reëlected to the presidency, and New Orleans and the Christmas recess of 1903 were selected as the place and time of the next annual meeting, to be held again jointly with the American Historical Association. J. H. H.

PALÉOLOGUE'S ROME.

PARIS, December 17, 1902.

I had occasion not long ago to speak of an essay on Alfred de Vigny, by M. Paléologue, one of our most delicate writers, in the series of the "Grands Écrivains de la France," published by Hachette. It is always a pleasure to read M. Paléologue, for he has a sort of refinement which is becoming very rare in our day of newspaper literature; he easily becomes poetical, though he always remains precise and accurate. He has just published a volume on Rome, with the modest sub-title of "Notes on History and Art." Who has not been tempted to write something about Rome after having visited this unique city, which Byron so justly called the "city of the soul"? Goethe wrote, after his visit there: "All that was to me till the present day but vain word and written tradition, becomes here a living conception." Ampère, who remained several years in Rome, where he was detained by the health of a very charming and delicate friend, occupied his leisure hours in writing his 'Promenades dans Rome,' a book which cannot be too highly recommended to those who wish to gain an intimate knowledge of the Eternal City.

The danger in writing a book on Rome is of falling more or less into the dulness of a guide-book. Not that a guide-book is necessarily dull: there are some, especially on Italy and Rome, which can be read with great pleasure; but it is difficult, when you have to mention churches, galleries, pictures, statues, to avoid a certain sort of monotony, M. Paléologue would himself probably confess that he has not entirely freed himself from this inevitable monotony; he has, however, succeeded in writing a very readable book, very attractive to those who have visited the places and admired the works of art which he describes; readable even to those who have not had this privilege, and whom he will undoubtedly inspire with the desire to visit Rome. He tells us very candidly beforehand that his account of Rome is incomplete—he speaks only of what he has seen; his book is a sort of journal of his visits, and has therefore all the freshness and vivacity of an immediate impression.

Whoever has been in Rome will always cherish a mental image of the Forum.

"In no other place," justly says M. Paléologue, "is this effect of resurrection more striking than in the Forum; in no other place have the monuments and their sites kept more intact their regenerative power. Thirteen centuries of history are evoked there in animated images, in speaking figures, in tumultuous pictures. . . . Religious ceremonies, popular assemblies, political trials, popular risings, feasts, funerals, triumphal processions, all the passions and the scenes of old, are formed again before the mind, by a clear and rapid intuition as by a direct view."

For some years the old Forum has been delivered to the archæologists. Its soil has been upturned, and a sort of reconstruction of the monuments of the past has been attempted. I confess regretting the Forum in its abandoned and deserted state, its meadows, its soft profiles, its solitude, which left in the mind a sentiment of profound melancholy. Still, I cannot blame those who have made researches in the strata accumulated by centuries, in order to discover what remained of the past. The last time I saw Rome, the whole surface of the Forum was dotted with broken columns, with ruins which marked the limits of the temples. M. Paléologue connects all these remains with history, and in this way he avoids some of the tedium of a mere guide-book. He makes us enter into the political activity of the Forum; he shows us the plan of the Rostrum, explains how the primitive Rostrum was placed near the patrician Comitium, and was in the time of Cæsar transported to the centre of the Forum. "The political thought which inspired Cæsar in changing the place of the tribune becomes evident when you inspect the site. To transport the Rostrum to the low Forum was to take away from the Comitium; it was a new step towards the *plebs;* it was the consummation of the rupture with aristocratic traditions; it was at the same time the last blow to the memories of liberty." The old Rostrum had heard Scipio, the Gracchi, Marius, Sulla, Cato; Cæsar's Rostrum heard the Philippics; it saw Cæsar's corpse before it was burned, the head of Cicero which was exhibited by his murderers, by order of Antony. Antony's wife, Fulvia, seized the head of the great orator by the hair. "With a truly feminine ferocity," says M. Paléologue, "she spat on it, took a pin out of her hair, and stuck it many times into the eyes and face."

In the Basilica of Constantine, which shows its majestic ruins in the Forum, we find an architectural type quite different from the old Roman. The vault begins to show itself instead of the horizontal roofs. The vaults were supported by gigantic columns. We miss the inner decoration, which was very rich.

"This immense ruin," says M. Paléologue, "one of the most picturesque in Rome, is also one which gives the best idea of Roman greatness. When the Emperor Maxentius laid the foundation of the edifice (in the year 300 A. D.), indescribable disorder reigned in the State. Since the reign of Gallienus, the decadence had made terrible progress. The Barbarians were crossing the frontiers on every side. In the beautiful and prophetic words of Tacitus, 'The Fates pressed the Empire everywhere' (*urgentibus imperii fatis*). Before long the fortunate rival of Maxentius, Constantine, was to transfer the capital to the shores of the Bosphorus. Nevertheless, Rome continued to impress on its monuments an indestructible character of boldness, largeness, and sumptuosity."

Who does not know the harmonious Arch of Titus, with its columns and the curious soffit representing the triumph of Titus and the spoils of the Temple of Jerusalem? The Arch of Constantine marks a critical period in the moral history of Rome. It bears these lines: "To the very great Emperor Cæsar Flavius Constantinus, who, by the inspiration of Divinity [*instinctæ divinitatis*], has avenged the Empire on the tyrant, etc."

"Who," asks M. Paléologue, "was the Divinity? Was it pagan? was it the God of the Christians? The vagueness of the formula betrays embarrassment. Immediately after his victory over Maxentius, Constantine was not wholly won over to Christianity; at most he was inclined to it. The great majority of the populace remained faithful to the ancient faith. The altars of paganism still received the official homage, and, as in the time of the Republic, the images of the gods continued to be borne in front of the legions. On the other hand, the Gospel was making marvellous progress. Surely the future was there. In adopting an ambiguous formula, the new master of Rome did not compromise himself. As he wounded no opinion, he ran the chance of conciliating them all."

Such remarks, which interrupt the mere descriptions, give a peculiar interest to M. Paléologue's volume. It makes us read history in the monuments. We cannot follow him everywhere, to the House of Augustus, to the imperial palaces, to the Palatine, to the Coliseum; all these have an historical as well as an artistic interest. Vespasian built the Coliseum in order to flatter the multitude and efface from its mind the memory of Nero, by an amphitheatre of extraordinary size and luxury. Titus continued his work, and employed the Jewish prisoners whom he had brought from Judæa. The great shows were inaugurated in it only by his successor, Domitian.

The history of Agrippa's Pantheon is very interesting. This monument has excited in all ages the greatest curiosity. It certainly inspired the architect of the Baptistery of Florence, and also Bramante when he conceived the plan of St. Peter's. Raphael worked in it.

"The artist is buried in one of its chapels, restored by himself. A Virgin, of which he had sketched the model and which was made by his pupil Lorenzetto, surmounts the altar. There is such a vivid feeling of antiquity in this statue that one thinks one can recognize under her veil a Venus of Milo. Near the master sleep the disciples, Baldassare Peruzzi, Giovanni da Udine, Perino del Vaga, the flower of the Roman school."

I pass over much which I can but recommend to the reader—the Forum of Trajan and Trajan's Column, the Baths of Caracalla, the Aventine, a number of churches (especially Saint John Lateran, Santa Maria Maggiore), the Castle of St. Angelo—and proceed at once to the Vatican, where Raphael and Michelangelo long detain M. Paléologue.

"When you reach the Piazza of Saint Peter, you have some difficulty in evoking the horrible drama of the year 65, the Christians delivered to the beasts, the women exposed in the arena, . . . and, in the end, to illuminate the nocturnal feast, the martyrs burnt alive in pitch. How can we imagine this horrible spectacle in a square of such pompous majesty, in front of this theatrical façade, between two solemn porticos?"

Michelangelo's "Pietà," which is in Saint Peter's, was begun when the artist was only twenty-three years old, in 1498. "It was at one of the most sombre moments of his life. . . . His master and friend, Savonarola, had been burnt a few weeks before on the scaffold. This probably explains the striking emotion of his work." Michelangelo began in 1508, at the age of thirty-three, the decoration of the Sistine Chapel, which he made world-famous. Many are the books which have been written on this decoration, which is so grand, so enormous

in its size, so varied, that it can hardly be conceived as the work of a single man. Who does not know, if only by engravings, the Creation of the World, the Creation of Man, Adam, Eve, the Sacrifice of Cain, the Deluge, Noah, and all those pages of the Old Testament, in the sublime interpretation of Michelangelo? Who has not meditated before the Precursors of Christ, the Prophets, the Sibyls, superhuman figures of colossal size? And who has not admired the vast composition of the Last Judgment? I can only say that M. Paléologue gives a very correct description of the great work of the Sistine, as well as of Raphael's work in the Stanze of the Vatican. What a time it was when two such men could labor for the glorification of Rome! These two names are immortal, like the name of Rome itself.

Correspondence.

COLOR AND CRIMINALITY.

To the Editor of The Nation:

Sir: In answer to Mr. Du Bois: According to the census of 1890, the illiterate negroes constitute 56.76 per cent. of the whole negro population. If education lessened criminality, the illiterate negro criminals should furnish a much larger percentage of the whole criminal negro population. But they furnish only 54.31 per cent. Educated negroes form 43.24 per cent. of the whole negro population and 45.69 per cent. of negro criminals.—I am, sir, etc. W. H. B.

THE FILIPINO LABORER.

To the Editor of The Nation:

Sir: In your issue of yesterday you refer to a letter from an officer, now in the Philippines, who, as you say, "writes us in opposition to the theory that the Filipinos will not perform manual labor."

Between 1852 and 1888 I spent more than twenty years in the Philippines. During those years all the agricultural labor was done by Filipinos. The crops of rice, tobacco, sugar, and hemp (*abaca*) were all raised by them. The labor in cleaning hemp is still all done by them. From Warner, Barnes & Co.'s circular of November 15, 1902, I see that the receipts of hemp for the year up to that date had amounted to 736,942 bales of eight to the ton weight. The very profitable work on the hemp plantations has induced many natives to neglect rice-growing for the more certain and profitable work on hemp, but, up to 1862, rice was grown in such quantities as to be exported. In my time all the stevedore work on board ship was done by natives, and the hemp presses in the provinces were all worked by Filipinos.

I got once a good lesson in manners from an old Filipino. I was overseeing some work which went slowly and not to my liking. I slung out at the men the word "Brutos!" (brutes). The old fellow approached me politely, and said: "I beg your worship's pardon; we are not 'brutos,' but we do not understand the language your worship uses." I apologized, and I hope never so failed in sense and politeness again.

The admission of Chinese would be a social, moral, and political danger; but this is too large a theme for my letter, which is only to confirm from my own exceptionally long and wide experience what your correspondent has told you.—I am, sir,

Yours faithfully,

Ogden E. Edwards.

1906 H Street, N. W., Washington, D. C.,
January 2, 1903.

Notes.

Dr. Aurel Stein's narrative of his Central Asian explorations in 1900, to which we made reference last week, is to be published in London by T. Fisher Unwin, under the title, 'Sand-Buried Ruins of Khotan.' The photographic illustration will be very copious.

Henry Holt & Co. have concluded to publish Kerner and Oliver's 'Natural History of Plants' in two volumes hereafter, instead of four parts, and at a reduced price, which is effected by leaving out the colored illustrations.

Two very sumptuous volumes from the press of G. P. Putnam's Sons reproduce articles on 'Famous Families of New York,' originally contributed to the *Evening Post* by Margherita A. Hamm; but they have been both revised and extended, and, what is more, they are now accompanied by a great many illustrations, many of which have never been published before. The sub-title, "Historical and Biographical Sketches of Families which, in Successive Generations, have been identified with the Development of the Nation," exhibits the point of view; and as not a little of the information conveyed has been furnished or certified by the existing representatives of the families in question, we get something like a glorified 'Who's Who.' Portraiture from generation to generation is always instructive, and there is plenty of it here. Pedigrees under the conditions of the present work can hardly be interesting reading, and, in fact, Miss Hamm's chapters are rather for reference than for literary delectation. There is an index to this liberally printed and handsomely bound work.

We make a too tardy acknowledgment of the second volume of the new issue of 'Chambers's Cyclopædia of English Literature' (Philadelphia: Lippincott), edited by Dr. David Patrick, with very competent associates. It closes with the Scottish vernacular writers under George III. American literature is reserved for a separate division, and will be considered with that of the British colonies. The up-to-date character of this revision is shown in a reference, under Lady Anne Barnard, to her South African letters published in 1901; and, under Erasmus Darwin, to Santos-Dumont and H. G. Wells as anticipated by that poet's famous prophecy of the steam-driven balloon; but Maxim, with his belligerent aerostat, was equally preindicated:

"Or warrior-bands alarm the gaping crowd,
And armies shrink beneath the shadowy cloud."

May the Hague Tribunal deliver us from this! The space given to E. Darwin, by the way, is considerable—about a third of what Burns gets; for obvious reasons.

R. H. Russell sends us 'Pictures of Romance and Wonder, by Sir Edward Burne-Jones, Bart.,' which contains twelve plates, by some unnamed photographic process, loosely tacked to gray mounts, and about forty half-tone cuts, besides a very weird portrait of the artist. The selection is fairly representative, containing many of Burne-Jones's best things as well as some of his worst. Except for a brief introduction, by Fitzroy Carrington, the text consists entirely of scraps of verse and prose from various authors. Sometimes these are the sources of the artist's inspiration, sometimes they have been written to illustrate the pictures, while now and then the connection seems slight enough. We must regret that there is no indication of the date or whereabouts of the originals, or of their material or purpose. Early work is mingled with late, oil pictures and watercolors are mixed with black-and-white drawings and designs for tapestry and stained glass, so that any one not already well acquainted with the artist's work is likely to be left with considerable confusion of mind as to his style and his ideals.

Mr. Edward S. Farrow, at one time a lieutenant in the army, presents in 'Camping on the Trail' (Philadelphia: Am. Arms Pub. Co.) a small volume, derived from his own experience and the reports of others, excellent for the novice and serviceable for the experienced. For those who read from curiosity, it illustrates a mode of life whose range is narrowing, and to the writers of the wilder Western fiction it yields abundant local color for stories of pursuers and pursued. Had the author's experience not lain entirely in the Northwest, he would have placed the agave (American aloe) of the South at the head of his list of antiscorbutics; and with somewhat better taste there would have been less reference to himself as devising equipage and directing scouts. Were the book indexed, its practical value for reference would be vastly increased.

'Nature and the Camera,' by A. R. Dugmore (Doubleday, Page & Co.), shows how the author secures the excellent photographs that have brought him favorable notice during the last two years. To put to practical use the information given here, one needs, however, considerable previous experience with a camera. In an introductory chapter, Mr. Dugmore gives suggestions about an outfit. For work with birds and other quickly moving animals, he recommends a camera that can be focussed on the subject at the same time that the plate is ready for exposure. The graflex instrument has thus far proved the most satisfactory. For catching animals in rapid motion, when instantaneous exposure is necessary, he advises the use of the focal plane shutter. This works directly in front of the plate, and allows the minimum time of exposure with the maximum illumination. He shows the advantages of a camera with a long focus and of one with a back focus instead of a front focus, and gives some space to the use of telephoto lenses, to the time of exposure, and to developing and printing. He recommends isochromatic plates for subjects that have much color, and explains the use of reflecting screens to soften shadows. The main part of the book gives detailed instruction in photographing birds, mammals, reptiles, batrachians, fish, insects, and flowers. The text is profusely and beautifully illustrated by the author's pictures.

'The Open-Air Boy,' by G. M. A. Hewett (R. F. Fenno & Co.), describes experiences of the English boy who likes camping and all the sports of woods and fields. Mr. Hewett sympathizes with a boy's propensity to capture and collect, and writes with much detail about trapping, bird's-nesting, fishing, "ratting," and "rabbiting." He does not attempt to give much instruction in natural history except in the chapters on collecting moths and butterflies and rearing caterpillars. He writes in a friendly, familiar way, but his style lapses often into carelessness. The book will interest American boys, though much of it cannot directly appeal to their own experience.

The beginnings of a credit-paper currency may be studied in the handsome volume of 'Tracts relating to the Currency of the Massachusetts Bay, 1682-1720,' which Andrew McFarland Davis has published through Houghton, Mifflin & Co. Eighteen very rare tracts, of some of which only a single copy is known, are here reprinted, with title-pages in facsimile, and notes. The arrangement is chronological, and in one case some interesting contemporary comments are printed, found in manuscript in a copy of the pamphlet. The reader is thus able to trace the gradual rise of the suggestion to issue paper money in Massachusetts, and the development of controversy as the demand for more issues became stronger and the evils of depreciation were more felt. The value of this collection lies in the economic as well as in the historical aspect, and no one who possesses Mr. Davis's excellent 'History of Currency and Banking in Massachusetts Bay' can do without this new compilation. No one who would appreciate the insidious growth of a "cheap money" idea, or measure its disastrous moral and economic effects, can find a better example for study than is here unfolded. Typographically, the book is highly to be praised.

Friederike Merck's 'Unser Liederbuch,' though originating on this side of the water, has had such success in Germany as to warrant a sequel with the same title (Mainz: B. Schott's Söhne; New York: Lemcke & Buechner). As before, the children's songs with music are framed in borders of appropriate colored designs, possessing the true German sentiment, and sometimes a whole page is monopolized by the artist. The pictorial portion will please any child of any nationality. Mrs. Merck's selection now leaves the better-known field, and this still further recommends it. The military element could not be wholly wanting (even Blücher is resurrected), but the seasons, bird and flower, slumber and prayer, sports, home-leaving, the pixies, constitute the mass of this interesting set of songs.

The handsome and far from meagre 'List of Bibliographies of Special Subjects,' just issued by the John Crerar Library of Chicago, is confined in its scope to that institution's collections, but will be thankfully received by librarians of high and low degree. The arrangement within the classes is strictly of the library and the shelf, and the key to the maze must be sought in the index. The leading classification is into Social Sciences, Physical Sciences, Natural Sciences, Applied Sciences, Fine Arts, History and Geography. One useful feature is the inclusion of "general indexes to periodicals covering more than two years, whether the periodicals themselves contain bibliographical material or not, and the catalogues of special libraries, which often are valuable as bibliographies." Since the *Nation* Index of the late W. M. Griswold is honored with admission under the former head, we may note that the Supplement (October, 1880-1885) is apparently not in the Library's possession, to say nothing of the complementary 'Political Record, 1865-1882' by the same unwearied friend of this journal. Nearly all the entries are annotated; and occasionally, as in the case of collaboration such as a *Festschrift*, the contents are analyzed. The publication is worthy of high praise.

When one of our distinguished statesmen eulogized the hog as the great American civilizer, his utterance was set down by an unfeeling world to Western bumptiousness. It may comfort us, therefore, to learn that others too can take our quadruped seriously. We read in a very recent number of Hinrichs's weekly catalogue the following announcement: "Andree, L. Das Schwein in poetischer, mitologischer (*sic!*), und sittengeschichtlichen Bedeutung. Paris: Verlag Zürcher Discussionen. (3 francs.)"

While in *Man*, "a monthly record of anthropological science," for December, 1902, the noted scholar in Japanese and Korean, Mr. W. G. Aston, properly points out the worthlessness of Kaempfer, the compiler, as an authority on Shinto, notwithstanding frequent quotations from his book by recent writers, showing that "the only safe rule for the student of anthropology and religion is to disregard everything that has been written before Sir Ernest Satow's accurate and scholarly contributions to the Japan Asiatic Society's Transactions in 1874-1881," the reputation of Von Siebold rises. The Japanese, with justice and appropriate gratitude, have reared on their own soil to this far worthier foreign scholar and genuine investigator no fewer than six memorials in stone. In the Transactions of the German Asiatic Society of Japan, volume ix., part i., Dr. H. ten Kate prints a paper describing these monuments and giving the inscriptions, with the aid of photographic half-tones. In two instances, Thunberg shares with Von Siebold the honors of memorial, the form of which is either an inscribed boulder or partially smoothed upright stone. These are duly inscribed in German, Latin, Chinese, and Japanese. Dr. Miura treats in the same number of Japanese "physiogonomy," adding a table of the Japanese open hand, showing how the palmistry of the Orient compares with that of the Occident. Whereas the topography, elevations, and depressions of the palm in the West take on the old classic mythological names, Oriental palmistry borrows its descriptive terminology for the circle or border of the palm from the eight points of the compass, while the three central valleys or creases are from "heaven, earth, and man." Dr. Krusen has an exhaustive paper on the higher class of Japanese prisons, giving in illustration the ground plans of those at Osaka, Yokohama, and Tokio. Dr. Lehmann writes of the culture and handling of tobacco in Japan. Professor Ishikawa tells of the Japanese salamander and the limits of its range, while Professor Florenz reviews two Japanese grammatical works, thus finishing nearly six-score pages of an unusually rich number of this valuable serial.

The recent death in Tokio, at the age of seventy-five, of Prof. S. Nishimura, one of Japan's most eminent scholars and reformers, recalls the rapidly dwindling numbers of the famous club in Tokio, the Mei Roku Sha, founded, as its name imports, in the sixth year of Meiji (1873). Mr. Nishimura was a student of Dutch in the forties, and ever a fearless Liberal, favoring intercourse with foreigners even before the Perry treaty, and when such opinions made one a target for the assassin. His famous book, 'A View of Western History,' published in 1869, helped materially to sway Japan into the path of progress on Occidental lines. He served in the educational department until 1886, when he was appointed Court Councillor and principal of the Noble Ladies' School. In 1890 the Emperor named him a life member of the House of Peers, but he resigned in 1892, to occupy himself with literary labors, becoming the author of twenty-one original works and the maker of six translations. Besides Nishimura, the Mei Roku Sha included such scholars as Fukuzawa; Mori, Minister of Education and the Mikado's envoy to Washington and London; Nakamura, early translator of Mill on 'Liberty' and founder of a flourishing school and (virtually) of the first party, out of which grew the Progressists; Kato, President of the Imperial University and now of the House of Peers, philosopher and ethical writer; the two Mitsukuri brothers, and many others of national and international renown, whose writings have educated the new generation. For many years the publications of this club formed a rich storehouse of intellectual pabulum and stimulus. The club still holds its monthly meetings in Tokio, though but two of the original members survive.

The Gordon Memorial College at Khartum has received an important addition to its equipment in some chemical and bacteriological research laboratories. The general aim of this department is to promote technical education; its special ends being to advance the study of tropical diseases, to aid criminal investigations in poisoning cases (which are frequent in the Sudan), and to promote the industrial development of the country. The success of the college, which was formally opened by Lord Kitchener a few weeks ago, seems to be assured, for in 1901 there were five elementary schools in or near Khartum, in which 150 boys were preparing for admission to the college. At the farewell dinner given in London to Dr. Andrew Balfour of Edinburgh, who has been appointed Director of the Laboratories, the announcement was made that "the commission sent out by the Foreign Office and the London School of Tropical Medicine to consider the disease called sleeping-sickness in Uganda had already discovered the germ and cause of that disease."

—We commend to our readers an article on the "War against Disease," contributed to the January *Atlantic* by Dr. Winslow, instructor in sanitary bacteriology in the Massachusetts Institute of Technology. The writer shows not only what exact knowledge can do in making possible the prevention or cure of many of the most deadly diseases, but also the possibility of such effective popular education as will secure to the masses the benefit of this knowledge. In the city of Buffalo, for instance, the

Health Commissioner undertook to reduce the rate of infant mortality by two specific measures—a careful supervision of the milk supply, and the distribution of printed instructions on the care of infants to every family in which a birth was reported. In 1898 the mortality of children under five years was only one-half what it had been in 1890, just before this work began. Particularly encouraging are Dr. Winslow's remarks concerning tuberculosis. He pronounces it emphatically a non-inheritable malady and easily curable in its initial stages. It is to be fought chiefly along the line of general improvement in sanitary conditions, household cleanliness, good ventilation, outdoor air, exercise, and healthful food. The happy feature about all this is that, while securing practical immunity from the germs of tuberculosis, it can but improve the moral and physical well-being of the individual and the community in a dozen other directions at the same time. Harriet Waters Preston performs the traditional office of the critic—"Thou ailest here, and here"—upon the recent novels of Howells and James. Allowing them to be the two most considerable American novelists since Hawthorne, she holds that both belied their native bent by adopting early in their careers the then new fashion of exhaustive study of comparatively mean subjects. Howells holds his reader by his personal charm, not the charm of his story. Take the personal amenity of the author from 'The Kentons,' and there remains a thin and pointless tale, describing with tedious particularity the languid interaction of a half-dozen utterly insignificant puppets, with absolutely nothing in the story itself to commend it. As for Mr. James, "Never, surely, in English drawingrooms or anywhere else, please God! did living beings actually converse after the manner of Mr. James's characters."

—Willis Gibson opens the January *Scribner* with an article on the Mississippi, "The Old Route to Orleans," with eleven full-page drawings by Jules Guérin. On the historical side the paper might have been strengthened by a fuller account of the old flatboating days, before the introduction of the steamer, when the boatmen tramped back northward through the forest with their rifles and their bags of gold. Mr. Gibson is mistaken in his assumption that when oared barges took the place of rafts for transporting produce down the river, these barges were regularly rowed back up again. When the distance was great, it was cheaper to sacrifice the barges and build anew. A fuller description of present-day coal boating would also have added interest, at a time when the transportation of coal by rail has attracted so much attention; and no article on any American river of to-day can be held complete without some consideration of the "shanty-boat" life which has developed to such practically annoying and sociologically interesting proportions during the past quarter-century. The Editor takes up the defence of the American reader against Mr. Howells's recent complaint that he will not be interested in plain types of "every-day Americans," but must have knights and ladies disporting themselves in a make-believe past, or moving in the glamour of a present-day Newport. The defence is, in effect, that the reader wants in his fiction characters that will make an impression upon him. Now the types chosen by Mr. Howells do make impressions upon Mr. Howells, or they would not be chosen; but the average reader is not attuned as Mr. Howells, and will continue to seek the desirable impression where it may be found. In the Field of Art, Mr. Russell Sturgis makes the recent Public Library exhibition of American wood-engravings the text for a discriminating paper on the growth and present condition of the art of engraving in America.

—The group of "artistic photographers," under the leadership of Alfred Stieglitz, who have seceded from *Camera Notes* and started an organ of their own, are thoroughly artistic in the terms of their prospectus. *Camera Work* is to be published quarterly, but that is the only definite statement made. "The management binds itself to no stated size or fixed number of illustrations, though subscribers may feel assured of receiving the full equivalent of their subscriptions"; and "the right to increase the price of subscription without notice is reserved." What you are to get, and what you are to pay for it, must equally be taken on trust. The first number is a thin quarto of sixty-five pages, handsomely printed on heavy paper, and contains eight plates. At least that is the number in our copy, Mrs. Käsebier's "Portrait (Miss N.)" appearing only in the list of illustrations prefixed to the article on her work. Besides her five, there is a plate after Mr. Stieglitz, and another, of young birds, after Mr. A. Radclyffe Dugmore. All these are excellently reproduced by the Photochrome Engraving Company, and are insets, printed on various kinds of paper and placed on mounts of different tints. The eighth plate contains two half-tone reproductions from paintings by D. W. Tryon and Puvis de Chavannes, used to illustrate an article on "Repetition with Slight Variation" as a principle of composition. On the whole, the purchaser of this number will get his money's worth. In the text there is singularly little about lenses or plates or chemicals, and a great deal about art. These gentlemen are trying to make photography into one of the fine arts, or to prove that it is already a fine art, and they take themselves and their effort with becoming seriousness. They do not hesitate to credit each other with "genius," and to speak of "great" works and "masterpieces" and of "idealistic" treatment of the nude. At this rate they should be thought to be not only artists, but far better artists than most of our painters; and one article would seem to prove that they are aware of this, for it is devoted to showing how lamentably the poor painters, who would hardly claim to be geniuses, have failed in "The Pursuit of the Pictorial Ideal."

—The final volume of the 'Letters to Washington,' published by the Colonial Dames of America, under the editorship of S. M. Hamilton (Houghton, Mifflin & Co.), includes the correspondence from May, 1774, to July, 1775. The land interests of Washington on the Ohio, and the so-called Dunmore's War, which was little else than a vulgar land speculation, are prominent in the earlier letters. In that connection the agencies of Valentine Crawford and Dr. John Connolly, afterwards of some notoriety, occupy attention. The obstacles to making new settlements on these Western lands are well brought out in Crawford's letters, and the vexatious behavior of the indentured servants sent on these ventures cost Washington a pretty penny, and in the end ruined the attempts. His miller, Simpson, writes entertainingly and in phonetic spelling of his troubles, and all through the volumes glimpses may be had of Washington as farmer, fisherman, miller, and trustee. The beginnings of industry are indicated in Johnson's letter on hemp (p. 83), and Stewart's suggestion for cultivating madder in America (p. 75); while the early effort to construct the Potomac Canal, with Ballendine as contractor, is of more than local interest. Such matters, however, gradually give place to the approaching Revolution, and military matters begin to engage Washington's time, money, and thoughts. He was much in demand in the companies of colonial militia, and he could have been in command of Virginia's troops had not the Continental Congress called him to the head of its army. A very elaborate index atones for whatever errors are to be found in the text, and the undertakers of this patriotic service deserve the gratitude of those desirous to acquaint themselves with the earlier years of Washington's career and the last years of colonial Virginia.

—It is a pleasure to read Dr. Samuel A. Green's latest volume, entitled 'Ten Facsimile Reproductions relating to New England,' and issued in a limited edition. The author has enjoyed special opportunities for acquiring unique examples of the issues of the early presses of New England, and from a fragment he can tell many an interesting story in bibliography and biography. A good example of his method and skill in tracing the history of a hitherto unidentified tract is to be found in the second essay of this volume. A pamphlet without a title-page or imprint, and with only a running-title as a guide, is traced to the earliest American poet, Benjamin Tompson (1642-1714), and the year of publication is approximately determined. An English variant is found which has such curious features as "M. J. Antonomies," intended for the Indian sachem Miantonomo. The study of this production leads up to unique copies of two elegies by Tompson, which are given in facsimile. One of them is entitled "A Neighbour's Tears Sprinkled on the Dust of the Amiable Virgin, Mrs. Rebekah Sewall," and is surrounded by the unnecessarily gruesome border used for such solemn productions. Some facts relating to the subjects of these elegies and some additional matter on John Foster, the printer, complete an essay that is full of careful research and true bibliographical enthusiasm. The facsimiles, being heliotypes, are very distinct and admirable.

—The other reproductions possess a varied value in themselves, enhanced by the comment of Dr. Green. A map of Massachusetts made in 1637, the seat of war near Boston in 1775, an excellent English map by an unknown engraver drawn shortly after the battle of Bunker Hill, and Rufus Putnam's plan of the towns in Worcester County, prepared in 1785, add something to historical geography. Boston is represented in the list of names of its streets, 1708, and the picture of State Street in 1801, while

a reproduction of the stamp issued under the Stamp Act of 1765 enables the writer to correct certain misconceptions as to its real nature. Groton has its share in the volume in Dr. Prescott's plan of the town, 1794, and Harvard University naturally enjoys prominence in connection with the essay on Stephen Daye, the pioneer printer in the American colonies of Great Britain. Daye's career is traced from some legal documents discovered by Dr. Green; and although the issues from his press never bore his name, a list of them is given so far as they are now known. Of these issues, examples of only eight have been traced. The meagre records relating to Daye have been skilfully used, and much is added relating to the early history of printing in Cambridge. The name of Daye's son, Matthew, appears on the title-page of the almanac for 1647, "the single example where a printer's name appears on the title-page before Green took charge of the press in 1649." The present volume is a credit to writer and printer.

—Those who think that the French are still far behind the Germans in solid historical work will find matter for reflection in a report on 'L'État Actuel des Études d'Histoire Moderne en France,' originally prepared by MM. P. Caron and Ph. Sagnac for the International Congress of the Historical Sciences which was to have been held last April at Rome. This report gives a critical estimate of the work of the principal historical societies of France and of the *sociétés savantes* which do some historical work; it also describes the historical reviews and the collections of documents now in course of publication. After characterizing the training for investigation offered in the universities, both at Paris and in the provinces, the authors finally pass in review each field of history since the Renaissance, to note the progress of investigation, the parts still neglected, and the works of synthesis which have sought to bring together the results gained by individuals. On the whole, the review is suggestive and fair. It takes no account of what was done in France prior to 1875, for the authors believe that, save by men like De Tocqueville and Quinet, there was little thorough work. They think that the present school, particularly under the leadership of Professor Aulard, is investigating even the most stormy incidents of the Revolution with the same impartiality that the mediævalist takes to his subject. Unhappily, there is no method which has the magical art of making fair-minded those deeply moved by either political or religious prejudices, and MM. Caron and Sagnac illustrate this fact themselves in their inability to refrain from unnecessarily harsh criticism of such books as those of M. Funck-Brentano on 'L'Affaire du Collier' and 'La Mort de la Reine.' In this case it was not so much a faulty method as the reactionary attitude towards the Revolution that sharpened their pens. But a little spice of prejudice like this furnishes its own corrective and does not impair the value of their general account. Several of their incidental discussions are suggestive. For example, they argue that the time is past when even so able a review as the *Revue Historique* can cover the whole field, and they urge the creation of special reviews which shall not print articles, but shall include simply criticisms, notes on methodology and bibliography, discussions of the value of documents, and descriptions of historical work actually in progress. All this is in the line of a more effective organization of historical studies the world over, which it was the aim of their report to promote.

TOSCANELLI AND COLUMBUS.

La Lettre et la Carte de Toscanelli sur la Route des Indes par l'Ouest : Étude Critique sur l'authenticité et la valeur de ces documents et sur les sources des idées cosmographiques de Colomb. Par Henri Vignaud. Paris, 1901. (Recueil de Voyages et de Documents pour servir à l'histoire de la Géographie, No. XVIII.) 8vo, pp. 319. 2 facsimiles.

Toscanelli and Columbus. The Letter and Chart . . . sent in 1474 to the Portuguese Fernam Martins, and later on to Christopher Columbus. By Henry Vignaud. New York: E. P. Dutton & Co. 1902. 8vo, pp. 365. Map, facsimiles and tables.

The books about Columbus all tell how he received a letter from a certain Toscanelli, described as an eminent Florentine savant, and state that this letter inspired the Genoese sailor with the determination to make a voyage westward across the Atlantic. In an age as rationalistic as the present, it is inevitable that some one should doubt whether this Toscanelli letter had the preponderant influence ordinarily ascribed to it. It is equally inevitable that some one of the investigators who are striving to find out something new about the period of great discoveries, should suggest that the said letter never was written at all. In his preface, Mr. Vignaud says that this latter idea, which forms the subject of his volumes, was given to him by M. de la Rosa, who, having sown the seed, very cleverly allowed Mr. Vignaud to cultivate it and to reap the credit, and whatever else, that may come from the public presentation of this decidedly novel theory.

The elements of the story of the Toscanelli letter are easily summarized. In 1571 there was printed in Venice the Italian 'Historie' of the life of Columbus, said to have been written by his son Ferdinand, in which the text of the letter appears, with a statement that it inspired the discoverer with the purpose to make his westward voyage. The same statement, given as a personal opinion, was made more than twenty years earlier by Las Casas in his 'Historia,' which was not printed until 1875, although it had repeatedly been used before that date in manuscript by historical writers. A Latin transcript of the letter was found in 1871 by Henry Harrisse in a volume which once belonged to Columbus, who wrote numerous annotations on the margins of its pages. The letter, which has thus been preserved in Italian, Spanish, and Latin versions, all made before 1571, consists of a courteous, undated note, covering a copy of a letter written in 1474 to a hanger-on at the Portuguese court. The note is in answer to a request for information and advice, and states that the writer, Toscanelli, can best answer the queries of Columbus by sending him the enclosed copy of a letter written some time before in reply to similar inquiries from the Portuguese court, regarding the possibility and desirability of reaching the Indian spicelands by a sea route. It would be futile to try to analyze here the ways in which Mr. Vignaud argues that Bartholomew Columbus concocted the whole story of this double correspondence, and forged the letters to maintain his falsehood. The evidence is, of course, entirely circumstantial, and the arguments assume knavery and stupidity on the part of every one connected with the affair, without the basis of a single positive, accepted fact.

On page 309 of his Paris edition, Mr. Vignaud states that when he began the composition of his work he did not expect to do more than show that some things in the accepted story of the Toscanelli correspondence are hard to explain. Every one will agree that the letter contains plenty of inaccuracies and misstatements, but all will not find the same difficulty in understanding how these could occur in a letter written to an unknown correspondent by the Florentine savant, approaching his eightieth year, on a subject about which he had no special knowledge. The more Mr. Vignaud wrote, the more he came to appréciate the force of his own arguments, and, by the time his task was half finished, he had become thoroughly convinced that the letter could never have existed except as a forgery. His opening chapters give the reader a most favorable impression of his fair-mindedness. He is evidently trying to state without prejudice a most puzzling historical problem, regarding which he desires only to find out the truth. Unluckily, he convinces himself that he has attained to a new truth some time before the reader loses track of the course of his argument. Just in proportion as Mr. Vignaud advances in his method of assuming in each new section that he has proved the assertion which the preceding section brought forward as a possibility—not a new method in argumentation—by so much will most of his readers proceed to as confirmed a disagreement with his conclusions.

Mr. Vignaud has failed completely, in the opinion of most students competent to determine the question, to establish the thesis upon which his book is based. Indeed, he explains in his closing paragraph that his conclusions are largely hypothetical, and that even the fundamental matter of the forgery cannot be established absolutely. Criticism is disarmed, but it may be permitted to express the opinion that Mr. Vignaud, having failed of his main purpose, has nevertheless made an important contribution to Columbian literature. Not only does he force historical writers to reconsider carefully their treatment of the ideas which led to the discovery of America, but he suggests a more reasonable explanation of how that discovery came about. Columbus was a man whose mind worked in the usual way, and his discovery, like most others, was more or less of an accident. The Toscanelli letter did not cause the discovery of America, for two very good reasons. In the first place, it was sent in reply to an inquiry which shows that Columbus had previously considered the matter of sailing westward. In the second, as Mr. Vignaud shows, Toscanelli, if one may judge from the very little that is known about him, had no particular knowledge of geographical affairs; further (and this is very skilfully done), nearly all of the statements in the Toscanelli letter might have come from a book

which, after circulating in manuscript, may have been perhaps printed at about the time the letter may have been sent to Columbus. Neither the note to Columbus nor the printed book is dated, and "may have been" is all that any one can say at present. Columbus owned and annotated a copy of that book, so that it is not surprising—despite Mr. Vignaud's hypotheses—that, if he received this letter from Toscanelli a dozen or more years before the achievement of his ambition, he never afterward referred to it as having had a decisive influence upon his thought or actions.

If the Toscanelli letter was forged, there must presumably have been some motive. Mr. Vignaud constructs this out of the well-known story of a nameless pilot from whom Columbus secured death-bed confidences regarding a visit to an island in the western Atlantic. This story was current among the contemporaries of Columbus, some of whom said that it gave him confidence in the success of his venture. It was recorded by Las Casas, as well as by other early chroniclers, with the comment that it probably had no very decisive influence upon the course of Columbus, and that it may not have been true. Most writers about Columbus have agreed with this opinion, but Mr. Vignaud claims, with good reason, that as a matter of fact the story is entirely plausible. There were a hundred tales, in every seaport of western Europe, of ships blown far out to sea where islands frequently were seen. Some of these islands, St. Brandans, Brazilia, and others, had well-established positions on the sea-charts of those days. Mr. Vignaud seems to state that the story told by his pilot was of a different category, and that it described an actual landing upon a real island in the Antilles. Evidently he does not himself believe this, however, for the most useful chapter in his book is probably the one in which he shows that Columbus very likely laid his course in 1492 by a chart whereon was marked the location of the island described to him by the nameless pilot. Columbus looked in vain for this island in mid-Atlantic, but even the greatest of maritime discoverers could not find what did not exist. This does not make it any less possible that the pilot thought he saw land in this part of the ocean, or that he maintained his faith in his eyesight by declaring that he set foot upon the land he saw. Stranger tales have been told and sworn to, and Mr. Vignaud is not the first who has treated the yarns of distant voyagers as material for serious discussion. Such discussion, to be profitable, calls for much scepticism and some intimacy with the vagaries of the ordinary human mind.

There can be no better training for such a discussion than that of a diplomatic position at the centre of culture and learning. That Mr. Vignaud is competent, no one who knows him will doubt, even though he prints in one of his appendices a long letter from Mr. John B. Shipley, containing a promise to supplement Mr. Vignaud's contributions with other more startling discoveries. Another appendix contains a detailed correction of the Latin transcript of the Toscanelli letter, by an authority on classical Latinity, who shows most conclusively that this text sins against all the canons of sound philology. Mr. Vignaud explains the value of this by stating that he has nowhere been able, notwithstanding careful research, to find any letter or work which he is certain was written by the learned Florentine astronomer. The illogical conclusion might as well have been drawn that there never was any Toscanelli. All the arguments against the authenticity of the 1474 letter could be applied just as effectively to prove that the manuscript treatise on comets ascribed to Toscanelli is a modern concoction.

GENERAL SIGEL'S MEMOIRS.

General Franz Sigel's Denkwürdigkeiten aus den Jahren 1848-49. Mannheim: Bensheimer. 1902.

The memoir written by the late Gen. Sigel of the part taken by him in the revolutionary uprisings in southern Germany in the years 1848 and 1849, is a piece of autobiography unpretentious in a literary point of view, but valuable as a contribution to the history of those troublous times. The narrative could hardly be more concise, simple, and sober than it is. Indeed, the reader would now and then wish it to go into more elaborate detail. But, so far as it goes, it produces the impression of absolute candor and truthfulness.

Franz Sigel, born in 1824, was the son of an officer in the civil service of the grand duchy of Baden, visited the gymnasium at Bruchsal for a few years, and then the military school, from which he graduated in 1843, whereupon he was appointed a lieutenant in the regular army of his little State. But in 1847 he resigned his commission, having had trouble on account of his liberal political views, and also of a duel he had fought with the adjutant of his regiment to right the wrongs suffered by a younger comrade. He then prepared himself for the study of the law, and was on the point of going to Heidelberg for that purpose when the news of the proclamation of the Republic in France, in February, 1848, came to unsettle his plans of life. The revolutionary movement swept with the rapidity of a prairie fire all over Germany, Austria, and Italy. As it was the first impulse of the people to arm themselves against the military power of the monarchs, men of military education who sympathized with the popular cause were everywhere in great demand. So it happened that the young ex-lieutenant was promptly called upon to organize a "Freicorps"—an independent battalion—at Mannheim, one of the principal cities of Baden, and a centre of revolutionary agitation in that region. This "free corps" became part of the civic guard of Mannheim, of which Friedrich Hecker, a man already famous as the most advanced of the liberal leaders in the legislative chamber of Baden, was the chief. Thus these two men became warmly attached to each other, and their friendship was destined to play an important part in Sigel's career.

He was not permitted to remain long in Mannheim, for his services were soon urgently demanded in the extreme southern part of the grand duchy, near the Lake of Constance, where the people were particularly alarmed by wild rumors that the Kings of Würtemberg and of Bavaria were preparing to send their soldiers against them and to rob them of their liberties. In point of fact, those monarchs were at that moment only too glad to be suffered by their own subjects to sit still on their thrones. But even the most groundless panics were easily spread in those days, and thus the good people in the lake region were most anxious to be speedily organized in armed array, so as to be prepared for defence, and Sigel obeyed their summons. These excitements, unreasoning as in great part they were, prepared the way for a still more unreasoning attempt soon after made by Hecker, who was a fiery orator and enjoyed an immense popularity among his countrymen, to start in that southwestern corner of Germany a revolutionary uprising for the purpose of making all Germany a republic. Sigel was drawn into the attempt by his attachment to Hecker, although, as he frankly confesses, his own judgment was very much against it. The enterprise resulted in disastrous failure. The new levies of volunteers, hastily called from the plough, the workshop, and the counting-room, were, as Sigel in his memoir describes with great clearness and candor, easily overcome and dispersed by the regular troops sent against them, and the leaders had to quit the country. Hecker went to America, settled down on a farm in Illinois, and subsequently served the Union as a patriotic and brave soldier. Sigel found refuge in Switzerland, where he wrote for German periodicals and waited for further developments.

He had not to wait long. In the spring of 1849, a singularly strange, almost grotesque, situation presented itself. The German Parliament, sprung from the Revolution of 1848 as the representative of the sovereign German people had been sitting in Frankfort since May 18 of that year. It had been openly or tacitly recognized by the German monarchs as a "constituent assembly," that was to make Germany a united empire on a constitutional basis. It had framed such a Constitution, and completed the work in March, 1849. Then it elected an emperor, and the choice fell upon the King of Prussia, Frederick William IV. The imperial crown was formally offered to him through a commission appointed by the Parliament on April 3. It took him until April 21 to form his final decision, and then he declined, his real reason for this momentous step being that the offer was made by the people, not by the princes, some of whom were supposed to have assented to it only under a sort of duress, and that the Constitution made by the Frankfort Parliament was too democratic. The rejection of the work of the National Parliament by the King of Prussia, involving the complete disappointment of the longing of the Germans for national unity, threw the whole country into intense excitement. In various places the people rose in arms to compel the recognition of the new Constitution of the Empire. In every instance it was the King of Prussia who sent his troops to put down the insurrectionary movements as criminal attempts against the legitimate authorities. The whimsical strangeness of the situation, then, was this: the insurgents demanded the enforcement of the Constitution framed by the National Parliament, and of its decree making the King of Prussia the Emperor of Germany, and the same King of Prussia who was thus to be made Emperor of Germany treated the same men who had thus risen as guilty of high treason. That the insurrection soon took a republican turn is true, but this was largely owing to

the attitude of the King of Prussia and other princes, who nullified what had been done to establish national unity on a constitutional basis.

The most serious of the uprisings took place in the Bavarian Palatinate, on the left bank of the Rhine, and in the Grand Duchy of Baden. In the Palatinate a large majority of the people, supported by a considerable number of soldiers who had deserted from the Bavarian garrisons (among them some officers), not only declared themselves for the National Constitution, but appointed a provisional government independent of the Bavarian crown. In Baden not only the people, but the whole regular army, excepting most of the commissioned officers, rose in revolt, and the Grand Duke took to flight—many of the superior functionaries of the administration with him. The provisional government, which was promptly instituted, at once sought to strengthen the regular army—which consisted of about 20,000 men, infantry, cavalry, and artillery, and which occupied also the fortress of Rastatt—with fresh levies of volunteers, and thus to build up a formidable revolutionary force. It was under these circumstances that Sigel was called back from his exile in Switzerland, and attached to the War Department of the provisional government to aid in the work of military organization. He was promptly on hand. In his memoir he vividly describes the deranged state of the administrative machinery—the functionaries of higher grade having left, and those of lower grade not knowing what to do—and the utter confusion of counsel as to the policy to be followed prevailing among the men at the head of affairs.

It should have been evident to every clear-thinking mind that the movement for the National Constitution in the shape of a popular insurrection was absolutely doomed to disastrous failure, unless the regular armies of other German states imitated the example of that of Baden, or unless the popular movement assumed such dimensions all over Germany that the governments must abandon the idea of withstanding it. There seemed to be a possibility of stirring the people of the neighboring kingdom of Würtemberg, who in various ways manifested much enthusiasm for the national cause, into sympathetic action, and, perhaps, even of inducing the whole, or at least a large part, of the Würtemberg army to follow the example of the army of Baden. This might have been brought about by a bold and rapid dash into that country, with a military array sufficient to impress the imagination of the Würtembergers with the strength of the revolutionary movement, to serve as a rallying point for volunteer organizations, and to bring home to the Würtemberg soldiers what could and ought to be done by them. Sigel had the good sense to see this, and accordingly proposed that such an expedition across the Würtemberg frontier be undertaken without delay. But he was overruled in the council of the provisional government, which favored an aggressive movement northward in the direction of Darmstadt and Frankfort. Some persons at headquarters even favored the plan of maintaining a strictly defensive attitude, and of not crossing the boundary of Baden at all. Such ideas prevailing over Sigel's advice, the fate of the insurrection was sealed, for if it did not rapidly spread, it was hopelessly lost. Prussia was gathering a large force on the lower Rhine, of which some Hessian troops with two Würtemberg battalions formed the advance, to invade Baden and the Palatinate from the north, while a so-called "imperial" corps under Gen. Peucker, consisting of troops from various German states, was forming to attack from the east.

Sigel was for a time Minister of War and chief commander of the forces, and as such conducted some operations on the northern frontier against the Prussians, which he elaborately describes. He was much interfered with by others connected with the provisional government, and it soon turned out that some of his regular troops, especially the cavalry, could not be depended upon. There were many breaches of discipline and several attempts at actual mutiny. Not a few soldiers strongly objected to being led "out of their country." The operation failed, and Sigel had to give up the chief command. Soon afterwards Gen. Mieroslawski, who had distinguished himself in Polish insurrections and who had been some time previously engaged by the provisional government to lead its forces, arrived on the scene. His selection was no doubt owing to a sort of superstitious belief then prevailing among laymen, that more than other people the Poles were in possession of the real mysteries of the military art, and wherever there was anything like a revolutionary war to be carried on, Polish officers were called into service. Mieroslawski was a man of recognized ability, and, with a sure eye for Sigel's merits, he made him his chief of staff and second in command. Meanwhile the Prussians under the Prince of Prussia (later Emperor William I.), advancing from the north, possessed themselves of the Palatinate, and crossed the Rhine at Germersheim to take Mieroslawski's army, which was concentrated at Heidelberg, in the rear, and, with the aid of Peucker's corps approaching from the east, to bag the main body of the insurrectionary forces. But Mieroslawski, by a rapid movement, threw himself upon the Prussians who had crossed the Rhine, fought them at Waghäusel, Sigel commanding his left wing, and won some advantages, when again his cavalry took to flight and carried a large part of the army with them. In a general order, published after the engagement at Waghäusel, Mieroslawski said: "Our situation is one of great difficulty; but so long as I have that calm young hero Sigel at my side, I must not despair of anything." Sigel does not mention this testimony in his memoir, but it deserves to be recorded.

By a very cleverly executed flank march, Mieroslawski withdrew his forces from the columns of the enemy converging upon him, but the rest of the hopeless campaign consisted in a retreat towards the Swiss frontier, covered by occasional fighting. One of these engagements, that on the river Murg, in which the poet Kinkel, who served as a private in a volunteer battalion, was captured by the Prussians, lasted nearly two days, and was in part quite creditable. After this action Mieroslawski laid down his command, which then again fell to Sigel. Although the army was a mere wreck, reduced to less than one-half of its original strength, he still planned an attempt to beat Peucker and exhaust the last possibility of relieving the forces besieged by the Prussians in the fortress of Rastatt; but in spite of his efforts to hold them together, one body of troops after another, against orders, worked its way to the Rhine, and crossed that river into Swiss territory. Finally, having only 4,500 men and 40 pieces of artillery left under his command, he had to do the same thing, and thus, he writes, "I bade farewell to my Fatherland forever."

The rest of the memoir contains the sad story of the 28 military executions that followed the surrender of the fortress of Rastatt and a short account of Sigel's wanderings as an exile until he found a new home in this republic, where in our own civil war he served faithfully and well. The book throws much light upon some of the causes of the failure of the revolutionary attempts in Germany in 1848 and 1849, and its modest and ingenuous tone does credit to its author.

Literary Values, and Other Papers. By John Burroughs. Boston: Houghton, Mifflin & Co. 1902.

We have not recently had a collection of diverse essays more delightful or more pregnant with suggestion than this by Mr. Burroughs. It should be said frankly, however, that they have the savor of "mere literature" rather than the austerer virtues of "mere criticism." In place of the masculine concatenation and ordonnance of ideas which is the all but inseparable quality of sound critical writing, they exhibit a genial, Emersonian effusion of thought which is stimulating and wholly pleasant, but perhaps just a little disappointing to the voracious reader, who, as Arnold would say, "wants criticism."

Mr. Burroughs's most significant remarks are in his dealings with the ever-fruitful subject of style. In his actual stylistic predilections he is surprisingly catholic; he can admire Virgil or Gibbon or De Quincey as well as Walton or Bunyan; but in his theory he is more of a protestant. No one has written better, more illustratively, of the absolute need in good style of liveliness, limpidity, expressiveness, and personality. He adopts the Wordsworthian notion of the word as the body of the thought—only its garment, as the body is the garment of the soul. At times, even, he seems to be writing of Style with a big S; but in this he is not altogether consistent with the meaning of his volume as a whole. More than once his just admiration for the wilding prose which snatches a grace beyond the reach of art, leads him to express an over-emphatic distrust of scholarly prose. We can readily agree as to the dangers of academies and libraries for the writer, but scarcely that "the simple, unbookish man" is the most likely to write good prose. Lucidity and measure, even enthusiasm and humanity, come as frequently to the truly cultured man as to the simple. It is a fair question whether, at this time of day, the man who publicly admires the prose of Whitman deserves better of his country than he who should be all for Newman, or, say, for Jowett.

It is quite in harmony with the bent of the body of Mr. Burroughs's work that he should deplore the stylist. But much that he has to say on his text of "Words, words, words!" is surely grounded upon a half-truth. That "the stylist's main effort is a

verbal one, to find a meaning for words"; that "his thoughts are word-begotten, and are often as unsubstantial as spectres and shadows," is quite true in many cases, but it is, at best, a superficial view. There is a very real sense in which the process of life itself is but finding the meaning of words. Some such sense as this lies at the root of Hobbes's famous remark, that words are a coinage by which we draw upon the accumulated experience of mankind. The true scholarly writer, the stylist even, secures by a kind of elective affinity those words which are the fittest substantial form for his thought. There is a place for the fresh, earthy word; there is also a place for the ink-horn term, and there is a tangible literary ideal of fine and full veracity which can be attained only by contrivance, sometimes even by artifice, of words.

The partiality of Mr. Burroughs's view is evident when he comes to definite judgment. His censure of the manner of Prof. Walter Raleigh's 'Style' is likely to provoke little dissent; but to say that men like Walter Pater "are enamored of style itself and cultivate it for its own sake," or that "Pater studied words; Arnold studied ideas," is to miss the point altogether. The greater wealth of Pater's learning and his excessively qualifying mind, contrasted with Arnold's preoccupation with "the chief and principal things," give some superficial color to such dicta; but it is, nevertheless, quite certain, *pace* Mr. Burroughs, that Pater did study ideas, and that the sole care of his writing was about truth—the perfect mating of word and meaning.

Yet, at the end of the essay on "Style and the Man," Mr. Burroughs swings to a conclusion so humane and sincere that we can do no better than quote from it:

"There are as many styles as there are moods and tempers in men. Words may be used to give us a sense of vigor, a sense of freshness, a sense of the choice and scholarly, or of the dainty and exclusive, or of the polished and elaborate, or of heat or cold, or of any other quality known to life. . . . In treating nature or outdoor themes, let the style have limpidness, sweetness, freshness; in criticism, let it have dignity, lucidity, penetration; in history, let it have mass, sweep, comprehension; in all things let it have vitality, sincerity, genuineness."

We have dealt at such length with the significant matter of style that we can pause but briefly over Mr. Burroughs's theory and practice of criticism proper. Queerly enough, his statement of the business of criticism is almost precisely identical with Pater's: to discriminate in a work of literary art those elements of personality in it which are most individual. To the human personality behind a book Mr. Burroughs strikes cleanly, but his criticism of this sort operates almost altogether by the consideration of details, the vital word, the beautiful line, or of the atmosphere. His criticism is so thoroughly impressionistic that while he can understand the imaginative heat which strikes out the true word or the polished line, he seems neither to experience in himself nor adequately to appreciate in others that shaping, formative heat of the imagination by which a work in any of the arts is created and moulded in symmetrical, living unity. It is for this reason that his general literary judgments are applicable chiefly to lyrical poetry and discursive prose, and prove inadequate when superimposed upon such forms as the drama or the epic. His process of thought in this direction centres around the singular statement that "to be moved to anything but admiration is foreign to pure art"—a notion which can be justified only by making "admiration" cover a variety of emotions reaching from the "sudden glory" of laughter to the disinterested love which we feel toward pure artistic beauty, and the awe which disturbs and subdues us in the presence of the sublime.

Three Years' War. By Christiaan Rudolf De Wet. Frontispiece by John S. Sargent, R.A. Charles Scribner's Sons. 1902.

Sargent's portrait of the burgher commander—a strong, attractive face with resolute mouth—is one of the most striking features of this book. Gen. De Wet's story of the Boer-British struggle of 1899-1902, is told with a grave simplicity, lighted up by touches of humor, and is devoid of the passionate declamation which might not unnaturally be looked for in the account of a war fought with such sacrifices, at such odds, and with so many grounds for bitter criticism of his adversaries. He does devote a few pages to the sufferings of the Boer women, both upon their devastated farms and in the concentration camps, but while his feelings are deep, his expressions are restrained, and more in sorrow than in anger.

As an addition to the mass of facts already at our command with regard to the motives and conduct of the war, the narrative is not important, for the ground has been thoroughly traversed before; its field of description is confined to the active warfare which began in October, 1899, and there is no discussion of the previous South African affairs which led up to the outbreak of hostilities. The weight of the story is derived chiefly from the character and achievements of the author, who, at an early period of the military operations, was advanced from the ranks, as a private, to the leadership of the army, when his fertility of resource and unwearied energy showed him to possess extraordinary fitness for his work. The appendixes are interesting with their detailed reports of the discussions which eventuated in peace. The assemblies of the representatives of the African republic to consider if they were under the necessity of surrender, were every day opened with prayer, sometimes by a clergyman, as often by one of the officers. They show the pathetic deeps of distress to which their people were reduced, and the reluctance of many of the leaders to recognize, even with their utter lack of resources and the likelihood of their country's being made a desert, that independence was hopeless.

From his inside view, Gen. De Wet confirms all that has been elsewhere told of the contemptuous audacity with which these farmers habitually assailed forces many times their numbers, with a sublime disregard of all precedents concerning the resistlessness of entrenched enemies. This assurance that any one of them was equal to three or four of his opponents, which they had contracted in their many combats with Kaffirs and Zulus, was illustrated in the first month of activities, at Nicholson's Neck, where two hundred Boers stormed a kop held by a thousand British, killed and wounded more than two hundred with a loss to themselves of nine, and took prisoners the rest, with their valuable equipments. A little later, at Roodewal, with half their opponents' force, and the latter in a highly defensible position, guarding a railroad storehouse of supplies worth three-quarters of a million of pounds sterling, they did immense damage to the English, capturing the men, carrying off and burying the ammunition, and giving most of the goods which they could not take away to plunder and flame. Among these valuables were large mail collections, full of miscellaneous treasures for the soldiers, which not only the Boer troops, but also the prisoners, were allowed, first, to ransack. "It was a very amusing sight to see the soldiers robbing their own mail. They had such a large choice that they soon became too dainty to consider even a plum pudding worth looking at." As they were reluctantly dragged away, they left a trail of parcels to mark their road.

Concerning the blockhouses, with connecting wire fences, which Gen. Roberts, in the last days of the war, drew as a cordon around the remnants of the republican army, our author speaks with scorn of their efficiency:

"The English have never been able to give an instance of a capture effected by them. On the contrary, when, during the last stages of the war, it happened, as it often did, that they drove some of our men against one or the other of the great blockhouse lines, we generally succeeded in breaking through with fewer casualties than when they concentrated their forces and formed a circle around us."

Something of this ineffectiveness seems to have been due to the disposition of the English soldiers to confine themselves to the blockhouses in apprehension of the deadly aim of their enemies, who, to the end, with all their feebleness of numbers, filled the English rank and file with profound terror.

The volume is dedicated "To my fellow-subjects of the British empire."

An Italian and English Dictionary. With Pronunciation and Brief Etymology. By Hjalmar Edgren, Ph.D., etc., assisted by Giuseppe Bico, D.C.L., and John L. Gerig. Henry Holt & Co. 1902. Two volumes in one, pp. 576, 452.

The need of a good Italian-English dictionary has long been felt, and it may be said at once that the above attempt to supply it is a great advance on its predecessors. The fulness to which it lays claim would be more apparent if resort had not been had to the compression to which the Germans were led by their compounds, and which is indeed a necessity if unwieldy bulk is to be avoided. Nevertheless, one turns regretfully back to the generous quarto page of old Baretti (1778), "improved and augmented with above 10,000 words omitted in the last edition of Altieri," and yet conceding not only a separate rubric to every word, but even a paragraph to each idiomatic illustration; not to speak of cross-references. The tyro in Italian will complain most in using Professor Edgren's Dictionary. Suppose, for example, that he seeks the verb *vivere*; after much patience he finds it embedded in a section led off by *viva*, with sixteen intervening words, all docked of the root *vi*. We cannot think that a happy economy, even if the arrangement be alphabetical. We must add, that out of thirty-three words embraced in this section only three, *viva*, *vivere*, and *vivido*, are exhibited in full; *vivo*, with which it

concludes, and whose exemplification requires nearly a third of the entire space, appears only in the mutilated form *-vo*. The editor plumes himself on this grouping of etymologically related words, as serving "the threefold purpose of both etymological and mnenonic association, of space-saving, and of facilitating the search for words by enabling the student to pass easily from one group to another." We think this a pure delusion. Much time is lost, and the whole image of the word, as we have shown, is seldom presented for the eye to catch and remember.

"Space for idioms," it is frankly admitted, "has been economized in favor of a larger vocabulary." The wisdom of this again may be contested. Baretti, who sought both ends, made his Dictionary highly readable, so racy was his English rendering of the Italian idiom. Nobody can read Edgren for pleasure, and he has minimized his assistance in discriminating among definitions strung one after another. His etymologies, being here, are welcome; but we could have spared them for Baretti's bracketed Italian synonyms (*e. g., miro* [*maraviglioso*]), or definitions (*e. g., ghetto* [*luogo dove abitano li Ebrei nelle città d'Italia*]), followed immediately by the English definition. This, we are well aware, would have exacted more room, but still we grudge a little the space occupied by the etymologies, which might have been granted to a modicum of grammar by way of preface. This is not wholly neglected in the vocabulary—irregular inflections are noted; but we could have wished the plural of substantives, a source of much difficulty, to have been regularly indicated there, as in German dictionaries.

To call in Dr. Johnson's friend once more to help out our criticism, let us quote Baretti on *chi*. He first defines it as a relative pronoun, masculine and feminine, 'who, whom,' with three examples and one (unlabelled) of the interrogative. There follows "*chi* [*quello che*]," 'he that, whomever, whomsoever,' with two examples; "*chi* [*alcuno*]" 'some,' with two; "*chi* [*chiunque*]" 'any man, any one, anybody,' with one—in all, 25 lines. Against this we have Edgren's single line: "*chi* [L., *quis*], pron.: who, whom, whoever." If, now, we turn to *who* in the English-Italian vocabulary, we find *chi* recognized solely as an interrogative pronoun.

In the prefatory page given to Italian pronunciation, we read, under "accent-marks," that, "though usage varies, Italian is ordinarily written without any other accent-sign than the grave for accented final vowels (whether pronounced close or open)." Nothing is said of diacritic marks distinguishing words spelt alike, nor of a practice, which has arisen in recent years, that leaves us *già, là*, etc., but requires *ché, perché, né, sé, sú, giú, piú, virtú*, etc. This change was worth noticing and discriminating. The indication of the pronunciation is one of the admirable features of this Dictionary.

The vocabulary, while rich, is, of course, far from exhaustive, and, in spite of the literary cast deliberately given to it, many words used by the best writers of the present day will be sought in vain. In a volume of classic modern verse republished only a few months ago we encounter *annitrire, arengo, maïnare*, for example, omitted here, as is *rudero*, though the plural, *ruderi*, is given. Under the letter I, the warning to look for a certain class of words under S is very obscurely conveyed thus: "*i-* prothetic sound before *s* + consonant," with no illustration. Even this does not stand at the head of the article, as it should to save a futile search for words like *(i)scambievole, (i)spumeggiare*, etc. Under O, some hint might have been given of the interchange of *o* and *u*, as "lutolento," "lutulento," "incolto," "inculto."

The English-Italian volume appears intended rather for Anglo-Saxon than for Italian consultation. Absent are caucus, golf, polo, monitor (the vessel), as if because the things designated are non-Italian; yet an Italian reader of English would meet constantly with all these words. Absent, too, are trade-union, boycott, strike—in the substantive or verbal sense—(though *sciopero scioperare* occur in the other vocabulary), sleeping-car (*vagone*, by the way, does not occur in its proper place, though it is given as a definition under wagon), job (of the political variety), jobbery, Jingo; and yet all these notions are familiar in the peninsula, as may well be vegetarian and vivisectionist. Prohibitionist occurs, but with no temperance connotation, though this is highly necessary for an Italian reader; and the equivalent given, *proibizionista*, is wanting in the Italian vocabulary. Further omissions are exterritoriality and Trust. Boom, the verb, is credited only with the sense of motion; not of humming, still less of promoting (in slang usage). Automobile and Salvation Army are taken in, along with "interview" and trolley, for neither of which is there an Italian equivalent, it would appear.

Our examination of this work is far from being intended to be censorious; rather to put users on their guard, and to contribute perhaps to some future revision. The spread of knowledge of Italian and enjoyment of its noble, never-flagging literature is much to be desired. Professor Edgren and his colleagues are entitled to hearty thanks for their endeavor to that end, whatever their shortcomings.

Journal of a Tour in the Netherlands in the Autumn of 1815. By Robert Southey. Houghton, Mifflin & Co. 1902.

Robert Southey wrote a goodly number of works acknowledged to be prose, and many more called poetry by a generation more indulgent even than our own.

> "No eye beheld when William plunged
> Young Edmund in the stream:
> No human ear but William's heard
> Young Edmund's drowning scream."

Even a Poet Laureate nowadays is expected to do better than this. Like many a poet in every generation, Southey was by nature a prose writer. The society of Coleridge and the air of the Lake District thrust upon him a sort of mechanical literary life, and in 1813 he became Poet Laureate. A few weeks after the battle of Waterloo, the sale of 'Roderick' justifying the expenditure, he decided to visit the battlefield and celebrate the victory of British arms. He set out, accordingly, with his wife and daughter and a friend on a month's tour. The poem on Waterloo, which duly appeared in sixty-one stanzas, is merely this journal thrown into verse and entitled "The Poet's Pilgrimage." The prose version, now nearly a century old, is here published for the first time. A publisher's note informs us that the MS. was bought at the Southey sale at Keswick in 1864 "by a well-known North Country banker and antiquarian of the day." Southey, of course, never intended his diary, which he wrote as a rough sketch, to see the light. But it is far more amusing and better worth reading than the version which he regarded as a professional achievement.

Southey had twice visited Lisbon, and is fond of comparing Portuguese and Flemish manners and customs. But his heart was in Keswick, and his appreciation of the scenery of the Netherlands is tempered by memories of Derwentwater. At Ghent the Southeys joined forces with some English acquaintances, and hereafter we read of the adventures of a party of eleven, with natural complications in the matter of posting-carriages and small country inns. There were, of course, no railways, and Southey's descriptions show a knowledge of the life and manners of the people which it would be hard to acquire in three weeks with our less intimate methods of travel. Everywhere he finds the English popular and the French detested. "The Prussians are spoken of with equal bitterness; perhaps with more, because they came in the character of friends, and acted as rapaciously as enemies." Southey devotes some thirty-five pages to his two visits to Waterloo, and as a contemporary account it has an interest for the modern reader. He shares the wish of the inhabitants that the battle should be called Hougomont or La Haye-Sainte or Mont St. Jean—anything rather than Waterloo, since the fighting was never nearer to that place than two and a half miles. The bravery of all who fought had made a deep impression on the people: Southey was told of the "absolute *rabies* of the French; . . . they curst the English while they were fighting, and curst the precision with which their grape-shot were fired, . . . neither too high nor too low, but struck right in the middle." The roads and fields were still covered with caps and shoes and French cards; bullets and weapons were being sold as souvenirs to excursionists; "five or six parties of English arrived while we were here." At Waterloo,

> "Lord Uxbridge's leg, the most remarkable relic of modern times, is deposited in the garden of a house opposite the inn. . . .
> "The owner of the house is as proud of possessing it as a true Catholic would be of an undoubted leg of his patron saint. The figure, manner, and earnest enthusiasm of this leg-worshipper were in the highest degree comic. He led us to a little mound in his garden, about three or four feet in diameter, and of proportionate elevation (sounding words should be used on great occasions), and in the centre of it is a tuft of Michaelmas daisies. The leg, he told us, had been at first interred behind the house. But the wife of my lord has requested him to plant a tree which should mark the spot; and he had removed the leg into his own garden, and there deposited it in a proper box or coffin. . . . In November he should plant the tree; it was to be 'un saule—English willow.' " 'Oui, monsieur,' I replied, 'j'entends—l'arbre larmoyant; the weeping willow. It will be very picturesque and pathetic.' "

Then follows a long French epitaph on "La Jambe de l'illustré, brave et vaillant Comte Uxbridge."

From Waterloo the travellers went to Na-

mur Spa and Aix, returning to Brussels by Maestricht and Louvain; then across the frontier to Calais, and so to Dover by a fourteen hours' crossing in the Post-office packet. Wherever he stayed, Southey bought books. In the village of St. Nicholas he picked up the 'Lives of the Admirals,' which one may suppose he found useful for his own work published a few years later under the same title. Of Antwerp Cathedral, which had been stripped by the French, he says: "The great picture of Rubens is expected to-morrow; others have already arrived from Paris (for which honor and praise to the name of old Blücher); and when they are replaced there is to be an illumination and a day of public rejoicing." Southey must have had a poor memory for anecdotes; he tells hardly any, and we meet with one of an Irishman repeated as new on page 237, within a few days of its appearance on page 38. His style is genial, and his interest in every detail of the tour makes him interesting to read.

There are a few misprints in the book, which is one of a limited edition and admirably got up. On page 114, for "more siro," read "more suo"; on page 147, for "L'ouvre," read "J'ouvre"; on page 34, the spelling of "Appelles" for "Apelles," and "Polycretus" for "Polycletus" in the Latin epitaph of Van Eyck at Bruges may be Southey's error.

Timber: A Comprehensive Study of Wood In All Its Aspects, Commercial and Botanical, Showing the Different Applications and Uses of Timber in Different Trades, etc. Translated from the French of Paul Charpentier, Expert Chemical Engineer, Assayer of the French Mint, etc., by Joseph Kennell. London: Scott, Greenwood & Co. 1902.

A treatise on timber, covering the ground marked out in the title above given, would meet with a hearty welcome from botanists, foresters, and engineers. Unfortunately, the promise of the title is not kept. The study is not comprehensive; it does not consider wood in all of its aspects, either commercial or botanical; it does not treat of some of the most important applications and uses of timber in the different trades. Hence it is distinctly disappointing.

The systematic portion, which sets out to describe the timber trees of the world, is characterized throughout by a lack of proportion, and by a greater lack of familiarity with the subject. To the timbers of Europe the author devotes twenty-two pages; to those of Africa thirty-two; to Asiatic timber, five; to the timber of North America, including Mexico, three pages; while that of South America has six or seven. This woful disproportion would not strike the reader as unpardonable, perhaps, were it not that there is an absolute carelessness in the selection of the species studied, and a still greater negligence in their treatment. Why should the basket willows demand in a work on Timber more space than is given to the white pine or to some of the great trees of France? Why should about two pages be devoted to an examination of the chemical behavior of the juice of the banana plant, a plant which possesses no true stem save a soft cone hidden in the bases of the leaf stalks, and which does not suggest Timber even in the remotest degree?

The work begins with an account of the classical researches of Payen and Frémy on cellulose, but it does not refer to the recent investigations in England and in Germany, which have practically revolutionized the subject. Next follows a chapter on Vegetable Histology, which the translator has made worse than it really is: he speaks of "Utricular" tissues, "Suberic" cells, "Streaky" ducts, and the like, wholly ignoring the general usage of English-speaking botanists. The discussion of the chemical and physical properties of wood is much behind the times, even with regard to the results of investigations by the French.

The author's method of treating individual species of timber trees can be best understood by a half-page taken from the study of the conifers:

"*Australian Pine* (*Pinus australis*). This valuable tree is seen uninterruptedly in the lower portions of Carolina, Georgia, and Florida, upon a wide stretch of ground. The average height of it is about 80 feet. Its leaves, which are of a beautiful brilliant green color, are very long."

Of course the translator is responsible for the blunder of making this southern pine *Australian*, but the author is responsible for the inadequacy of the description. Let us take a species nearer home:

"*Pitch Pine* (*Pinus rigida*). This variety is met with upon the littoral of the Atlantic. Light, tractable, and sandy soil is especially suited to its growth. Upon gravelly and sandy soils the timber of this tree is compact, heavy, and contains a large amount of resin. It is employed for a variety of purposes, and has been for some time in demand for the building of Swiss cottages and light furniture."

"*'Lord Weymouth' Pine* (*Pinus strobus*). This is a very beautiful tree, but is very sensitive to cold and heat. It accommodates itself to all descriptions of soil. Its timber, suitable for numerous purposes, is largely employed in shipbuilding."

This is the description of the noble White Pine!

The spruces are called "Firs." The following unnecessary confusion is introduced respecting our common spruces:

"Outside of the different species of pine, the most important varieties found in the forests of the State [of Maine] are the elm, platane, maple, beech, then, in decreasing proportion, the oak, birch, lime, and ash. Among the smaller trees, the larch, cedar, fir, poplar, and wild-cherry trees are especially found. . . . The best timber actually obtained upon the banks of the Penobscot, Kennebec, and other large rivers is that from the fir-tree. Planks about 100 feet long and 6½ broad without a single knot are the current merchandise. These planks are obtained from gigantic fir trees."

It does not seem at all necessary to italicise the many errors and inconsistencies in these statements. They serve as fair illustrations of the work.

The author is said to be an engineer, and in the part of the book devoted to the exploitation of forests and that sort of thing, belonging mostly to engineering, he is at his best. But he does not write concerning these matters as a forester would and as an authority on timber should. He is a chemist, too, and we naturally look for a clear and accurate treatment of chemical phases presented by timber and by wood in general. But the following extract shows that the author and the translator, between them, have made rather a mess of it:

"In manufacture made with violet-ebony sawdust a rather interesting phenomenon is produced. The air is expulsed, and the mixture of sawdust and blood albumen undergoes fusion. A new matter is formed resembling woody tissue, and a hard and dense wood is obtained capable of undergoing all cabinet-making work."

In a volume professing to treat of the different applications and uses of timber, and of all the commercial aspects of wood, the subject of wood-pulp, a very important product of our forests in the Old World and the New, ought to receive at least a few pages, even to the exclusion of such topics as the extracts from orange flowers. In short, a work on Timber should treat of Timber. The present volume would find its chief usefulness as affording exercises for correction in the forest schools, provided the students could be made to regard the task seriously.

The Story of the Trapper. By A. C. Laut. Illustrated. D. Appleton & Co. 1900. Pp. xi., 284.

The story that a boy when told, after he had first read 'Robinson Crusoe,' that it was not true, burst into tears, could not repeat itself in regard to the present Story. The internal harmony forms a kind of internal and circumstantial evidence which will not let readers believe it false in any important point. The writer conceals her sex not only by initials on the title-page, but throughout, while she has reason to be proud of it. Countless particulars, each adding its little utmost of glowworm light to the perfection and charm of her pictures, would have escaped masculine eyes and pens. Her experience of fifteen years in the broadest trapperdom on the globe brought her into touch with those who rule and who serve there from lowest to highest. The revelation thus unveiled to her at once was so fascinating that she sought it again and again, with "a gypsy yearning for the wilds." Her book is a new proof that lookers-on at a game may see more than the players themselves, and will tell its story better.

About one-third of the volume consists in a sketch of the American fur field in the trans-Mississippi—extending at first up to the sources of that river, and thereafter broadening from ocean to ocean, and boundlessly north. We are told of chronic conflicts, corporate, national, and international, for this richest spoil; that while other companies have proved bubbles which the earth as well as the water hath, the Hudson's Bay remains a pyramid; that its sway is undisputed, that its business is, and will continue, as large as ever throughout a region vaster than our settled area. It is claimed that these "Lords of the North" have saved the game and the aborigines, while the United States have destroyed both.

The remaining two-thirds of the volume affords a more detailed account than we know where to seek elsewhere of life and labor in trapperdom. The trapper, isolated like Robinson Crusoe, has a far more scanty kit of tools. How he exists and achieves success in perpetual snow, cold, and want of all things, is a mystery which piqued the curiosity of Miss Laut. The results of her plucking out the heart of it will be welcome news not only to inquisitive children, but to the most thoroughgoing votaries of outing among us. They will here read secrets, gleaned from men who can-

not read, about the ways of beasts in the great lone land which are not written in professional treatises. Some questions here answered are: How does the trapper make his canoe, his moccasins, and skin clothing; how can he contrive snow-shoes that will also serve for snow shovels, and such that he can also "sit on their rear ends and coast as on a toboggan" (p. 120); how does he shoot or "leap" a rapid; how do signs unnoticed by others or unmeaning to them point him to his prey in their hidden lairs; how does he hide his traps so that they are neither seen nor suspected by the ever suspicious; how does he keep warm while a stranger in the same dress is freezing beside him? We learn with wonder that not only a man's track, but the faintest trace of human odor at a trap, means failure. Among tricks for purging away the "man-smell" about traps we read: "The first thing a trapper does who has had a long spell of ill luck is to get a sweating-bath and make himself clean" (p. 152). Usually his main use of fire is to keep wolves off rather than to keep himself warm. Wolves dogging behind a sled are checked by throwing among them a fish which has been specially poisoned. A tree is meaningless to a newcomer, but its moss, branches, their slope and number, are telltales of all the points of the compass to a veteran. But the occult science of the American Siberia must be sought in the disclosures of Miss Laut, which lack nothing but an index and cannot be summarized.

The last word which space allows us must be regarding the expansion of trapperdom forever more and more northward. The farther north the finer the fur, and the finest is to be found only on the white wastes of the polar zone. The fox is said in a proverb to grow gray before he grows good, and in low latitudes his color is such that trappers scorn to take him. Above the Arctic circle, however, and in the dead of winter, the fox blooms into his highest beauty—the silver fox, a nonesuch both for a glory and a covering. He is so hard to catch, and above all to reach in his habitat, that in the palmiest days of the fur-trade half a dozen of the best was the output, and now a single one is the yield of half a dozen years. Yet whoso traps that one, makes his fortune.

Cecilia: A Story of Modern Rome. By F. Marion Crawford. The Macmillan Co.

There is a certain fascination in placing very modern frivolous people in surroundings known to all by the traditions of history. The antithesis is very striking, and adds interest to a meagre tale. Mr. Marion Crawford knows Rome well, and has the grip of any amount of local color in things Italian, but his personages remain puppets, and we cannot help seeing the strings that keep them in motion and knowing from the first how it will all end. Cecilia, the heroine of this latest romance of modern Rome, is described as bearing a striking resemblance to the Naples Psyche. She has an immense fortune, is deeply interested in archæology, especially the latest discoveries in the Forum, and has the pretension to divert her life by her desultory studies in philosophy. Notwithstanding the categorical imperative and the sibyllic utterances of Zarathustra, Cecilia Palladio behaves with the want of purpose and frivolity of a mere butterfly of fashion. She is supposed to lead a double life through autosuggestion, and to imagine herself in the past the last of the Vestal Virgins. In her dream state she meets a man whose irresistible power over her is one of the cherished experiences of her existence. The living embodiment of this dream lover she meets by chance at the house of a foreign ex-princess, who is anxious to marry the heiress, for her own purposes, to her nephew, Guido d'Este, whom she introduces to her at the same time with Lamberti. Both Cecilia and Lamberti feel that they must have met before, though it is shown to be impossible. The night after the meeting, they both dream the same dream of a love scene between them in the House of the Vestal Virgins, and in the morning they visit in the Forum the scene of their dream and meet. The girl, terrified at the coincidence, rushes away, and Lamberti can account for her strange behavior only by feeling convinced she has dreamed the same dream which led him thither. Notwithstanding these telepathic experiences, Cecilia accepts Guido d'Este as her affianced husband, and Lamberti honorably avoids her presence. The situation becomes intolerable to Cecilia, who breaks off with Guido d'Este, telling him frankly that she loves another. Malaria and disappointment in love, besides a false imputation on the young man's honor in a foreign newspaper, bring about brain fever, through which he is nursed with devotion by Lamberti, who in the end marries Cecilia, having satisfied all the exigencies which the complications of the case presented. The lack of literary style and the general diffusiveness make the book fall into the category of railway reading.

IMPORTANT ANNOUNCEMENT

Appletons' Business Series

Authoritative Analyses of Modern Commercial Conditions

THE final decade of the nineteenth century witnessed an almost revolutionary development in commercial and industrial conditions. Where, in ordinary enterprises a few years ago, thousands of dollars sufficed, now millions are required. On so gigantic a scale is business conducted that it is often beyond the grasp of a single mind. As a result, it is an age of specialization. Business is now a science. Every branch, every subdivision, requires an expert.

With this development has arisen a demand for books treating of financial and allied subjects. Naturally it has been a time for the exploitation of all sorts of theories, with the consequent engendering of a distrust on the part of those who are seeking positive information. Realizing this, **APPLETONS' BUSINESS SERIES** has been planned with a view to securing the ablest writers obtainable, men who have made a study of conditions as they actually exist, and who have brought to bear upon them minds trained in the analysis of economic problems.

Already Issued

FUNDS AND THEIR USES

A Treatise on Instruments, Methods, and Institutions in Modern Finance. By Dr. F. A. CLEVELAND, of the Wharton School of Finance, University of Pennsylvania. Profusely Illustrated.

"A very useful book."—*New York Journal of Commerce.*

"Dr. Cleveland has undertaken, with success, to bring the facts of financial life within the reach of the reading public.—*The Wall Street Journal.*

"The most important contribution to business literature that has come from the press in a long time."—*Cleveland World.*

"The ambitious clerk, who has to act for his employer under instructions which he does not always find perfectly intelligible, and which of necessity leave more or less to his discretion, will find Professor Cleveland's book the basis of a liberal business education; and if he will familiarize its contents and keep up with what is going on in the world of business and finance by following the daily reports, he will quickly gain a knowledge which will have a money value, and which cannot fail to attract the attention of his principals. A knowledge of methods of procedure in business, and especially in matters involving credit, is of exceeding value to every one who has to do with affairs, and this information could not very well be imparted more lucidly or in fewer words than Professor Cleveland has used. The young business man will read it with interest and gain much useful knowledge from it."—*New York Times Saturday Review.*

Ready on Saturday

THE WORK OF WALL STREET

By SERENO S. PRATT. 12mo. Cloth, $1.25 net; postage, 12 cents additional.

The author says that he has conceived his duty to be that of a reporter rather than of an editor, and has sought to present the facts as they are, leaving to others to inquire why they are not something very different.

He has succeeded admirably in presenting, with sufficient fulness of detail, an entertaining account of the evolution of Wall Street, of the origin, the meaning, the scope, and the operations of the stock market, of the machinery of the Stock Exchange, of the connection between speculation and the banks, of the methods of the money and exchange markets, of the promotion and organization of new companies and trusts, of the floating and listing of new securities, of their hypothecation for loans, of the bank statement, of gold shipments, of the private bankers and underwriting syndicates, of manipulation and corners, and of panics and their prevention.

TRUST FINANCE By Dr. E. S. MEADE, of the University of Pennsylvania (*nearly ready*).

Each 12mo, cloth, $1.25 net; postage 12 cents additional.

In Preparation: **Railroad Finance, Transportation, The Modern Bank, The Insurance Company, The Trust Company, Credit, Modern Accounting.**

MONT PELÉE
and the Tragedy of Martinique

By PROFESSOR ANGELO HEILPRIN, F. R. G. S.
President of the Geographical Society of Philadelphia.

THIS work, almost unique in the class of exploration and scientific research, presents the first complete account of the catastrophic events of the island whose misfortunes have so roused the sympathies of the world, and added a chapter to history as interesting as that of the fall of Pompeii and Herculaneum. Prof. Heilprin's early visit to Martinique permitted him to study the scene of the major disaster very soon after its happening, while his experiences on the still burning volcano, whose crater he was the first to visit after the tragic eighth of May, and during the great eruption of August 30, of which he was a direct observer, were such as to make the narrative describing them one of thrilling interest.

The author's qualifications as an investigator, geologist, and geographer give to the work its stamp of scientific authority, and it can safely be said that it will remain the standard work on the subject of which it treats for many years in the future.

The book, in large octavo, contains three hundred and thirty-five pages in text, and there are nearly forty full-page plates, made up in greater part of reproductions from photographs taken by Prof. Heilprin himself. Many of these reveal the volcano in its climax of eruption and in rapidly following successive stages of activity. No such record is to be found elsewhere.

THE SOCIAL UNREST

By JOHN GRAHAM BROOKS

Studies in Labor and Socialist Movements

A readable study of "live questions" such as Strikes, Trade Unions, Arbitration, Child Labor, Time Work, the Influence of Machinery, subjects on many of which no literature is accessible or is but partially applicable to American conditions of the present moment. The personal observations on which the book is based range over eighteen years, including direct investigation of every important strike in the anthracite coal regions during that time.

Cloth, 12mo, 394 pp., $1.50 *net* (postage 13 cts.).

OUR BENEVOLENT FEUDALISM.

By W. J. CHENT

Cloth, 16mo, $1.25 *net* (postage 8 cts.).

"A remarkable book, which, beneath its sarcastic acceptance of the conditions of to-day, veils a passionate but despairing hope for something more in accordance with his ideas of justice between man and man."—*The New York Herald.*

"This book can do good in exposing strikingly, but with marked temperance, the countless hidden ways in which great federated capital threatens the body politic."—*The Evening Post, N. Y.*

MATTHEW ARNOLD'S NOTE BOOKS

With a Preface by the Hon. Mrs. **WODEHOUSE** and a portrait.
8+137 pp. Cloth, 12mo, $1.00 *net* (postage 7 cts.).

BETHLEHEM: A Nativity Play

By **LAURENCE HOUSMAN.** Performed with Music by JOSEPH MOORAT under the Stage Direction of EDWARD GORDON CRAIG, Dec. 1902. 12mo, cloth, $1.25 *net* (postage 6 cts.).

THE POETICAL WORKS OF JOHN KEATS

Edited with Introduction and Memoir by **WALTER S. SCOTT.** Revised by **GEORGE SAMPSON.**
632 pp. 12mo (Globe Poets), cloth, $1.75.

A WEEK IN A FRENCH COUNTRY HOUSE

By **ADELAIDE SARTORIS.** Illustrated by Lord Leighton, P.R.A. With a Portrait, and a Preface by Mrs. RICHMOND RITCHIE.
12mo, Cloth, $1 50 *net* (postage 10 cts).

AN ELEMENTARY TREATISE ON THE MECHANICS OF MACHINERY

With Special Reference to the Mechanics of the Steam Engine.

By **JOSEPH N. LE CONTE,** Instructor in Mechanical Engineering, University of California.
311 pp., 12mo, cloth, $2.25 *net*, (postage 15 cts.).

By THE MACMILLAN COMPANY, 66 FIFTH AVENUE NEW YORK

The Nation.

NEW YORK, THURSDAY, JANUARY 15, 1903.

The Week.

To the demand of the President and the country that the duty on anthracite coal be repealed, the protectionists in Congress propose, at last, to yield in a grudging and elusive fashion. They say they will rebate the duty for a twelvemonth. In this way, they think, they can quiet popular clamor and at the same time save their precious "system" from being meddled with. But are they not, after all, teaching consumers a dangerous lesson? That the tariff does bear heavily on the necessaries of life, and that a sufficiently united and vigorous protest can make even hidebound protectionists retreat—to have demonstrated those two truths seems to us to be setting an evil precedent. How do we know but the next demand will be for the repeal of the protection which monopolies enjoy? To withstand the very beginnings of regard for the consumer would have been the wiser course, purely from the point of view of the most far-sighted protectionist strategy. When once you begin to take off tariff taxes, you never can tell where you will be able to stop. Such temporary relief as is now promised in the matter of the coal duty should, of course, be welcomed, though we hope that the Democrats in the Senate will offer amendments untaxing beef and steel and wire fencing and glass, and compel the Republicans to go on record. But the great lesson for the people to take to heart is that they can get whatever they want, even from a protection-mad Congress, if they only insist upon it loudly enough.

The sudden agility of aged Republican Senators like Hoar or Platt of Connecticut in dodging on the question of the coal duties, has its amusing side. They raise grave Constitutional doubts about the power of the Senate to have anything to say about the tariff—that same Senate which has really made all the tariff bills of the last dozen years! Senator Lodge squirms painfully. Non-partisan and influential committees from Boston are bombarding him with this list of questions:

"(1.) Whether you favor the immediate removal of the duties on coal and beef?

"(2.) Whether you are willing to appear at a hearing of the Ways and Means Committee in behalf of the bills referred to them to put coals on the free list?

"(3.) Whether you will use your influence to have such a bill reported at the earliest possible moment?

"(4.) Whether you will, individually and as a member of the delegation from New England, do all in your power to secure the immediate passage by Congress of a free-coal bill?"

The poor man replies by introducing a bill for the removal of coal duties for *ninety days.*

Secretary Root learns "with regret" that the Beet-Sugar Association will not permit tariff relief for the Filipinos. Regret is proper enough, but when the Secretary goes on to assert that Oxnard's opposition is unintelligent and "preposterous," and to maintain that the bill should be passed nevertheless, he displays something very like insubordination. Of course, the Constitution makes the President and Secretary of War nominally higher authorities than Oxnard, but the Constitution does not run in the Philippines, and it is only beet-sugar that follows the flag. That Oxnard is fully aware of his own prerogatives, and means boldly to assert them, he makes plain in the little memorandum which he has filed along with his reluctant approval of the Cuban treaty. That act, he explains, must not be taken as an endorsement of reciprocity in general; and all the other reciprocity treaties, he declares, must be beaten. That settles it. Oxnard has exercised the veto power. *Bos locutus est.*

President Roosevelt, finally realizing the true condition of our Filipino subjects, has turned to the Congress which rejected his pleas for the Cubans, to beg $3,000,000 to keep our wards from dying of starvation in the fifth year of the American reign. The Philippine Commission has already spent $15,000,000 for the same purpose out of the insular revenues. Now it asks further aid lest the Filipinos die by thousands for lack of food, and under the flag that has been forced upon them against their will. The President, who now declares that the enactment of relief measures for the betterment of the Philippine Islands is "imperatively demanded by the situation in those islands," and who solemnly asserts that "serious calamity may come from failure to enact them," is the same Theodore Roosevelt who, on December 2, doubted whether the modern world had seen a "better example of real constructive statesmanship than our people have given in the Philippine Islands." In his entire reference to the unfortunate archipelago there were only words of praise and gratulation—of rejoicing, that is, over a situation which did not exist. The least that Congress can do is to vote the Filipinos, without loss of time, the sums necessary to keep them from dying of starvation. To end a similar horror in Cuba, the nation rushed into war in 1898. To relieve destitution in Armenia and India, our generous people put their hands deep down in their pockets and gave freely of their means. Chambers of commerce, churches, and philanthropic organizations vied with each other in this work of humanity. To give less freely now would be to notify the world that our own subjects are held less dear by us than those of other nations.

We are at a loss to understand the President's action in interfering to prevent, if possible, the choice of a Mormon Apostle as Republican Senator from Utah. In the first place, it looks like unfair discrimination. Mr. Roosevelt has disclaimed the right to interpose in Delaware to block the pure ambition of Addicks. Even in his own State, where it is proposed to return a notorious political corruptionist to the Senate, the President makes no sign of disapproval. Quay made his fight for reëlection in Pennsylvania, and the White House was dumb. What has Utah done, thus to lose among sovereign States her equal right to disgrace herself? Then, why object to an Apostle? The candidate in question, Apostle Smoot, is not a polygamist. He has made himself the head of the Republican party in Utah—"redeemed" the State, in fact, from Democratic control—and why should he not have the reward that goes with that position? Addicks has no clearer title, yet the President respects his; why draw the line at Smoot? It cannot be said that the latter, as an Apostle, would be out of place in the Senate. A certain apostolic succession already obtains in the Senate, if we may accept a witticism current in high circles in Washington. The common way there of discriminating between the two Senators named Platt is to refer to Senator Platt of Connecticut as "Judas *not* Iscariot." Apostle Smoot would be perfectly at home with his New York brother who carries the bag. If the House of Lords has its bishops, why should not the Senate have its Apostle? It was said by Dickinson in the debates in the Constitutional Convention that the true aim was, by "a refining process," to make the Senate as much like the English House of Lords as possible. It seems to us that the refining process which has given us hereditary legislators like Quay and Platt, and promises to furnish us a knight of gas and bribery like Addicks, might easily justify the introduction of a Mormon Apostle into the Senate, as the nearest approach to a lord spiritual that we have.

Time and the Supreme Court have vindicated the decision made by Mr. Gage as Secretary of the Treasury on the Russian sugar bounty question. He held that an export bounty was paid by Russia, although the Russian Government denied it. Accordingly, he ordered the imposition of a countervailing duty un-

der the Dingley Act. The Russian Government replied by levying extra duties on a large number of articles of export from the United States, by which means a very promising trade was crippled. This condition of affairs still exists. It is much to be regretted that our exporters of iron and steel and machinery of various kinds should be deprived of a market which they had fairly won, since somebody else has done something else somewhere else; but the facts show that Secretary Gage had no option.

The passage of the Army Staff Bill by the House gives fresh ground for the belief that it will speedily become a law. While it is not a perfect measure, as Secretary Root has frankly admitted, it is a long step in the right direction. One by one the arguments against it have been met and shown to be without foundation. The cry that this was a foreign innovation was effectively answered by Gen. Corbin recently, who explained that it was the Americanization of a good European idea. The United States is certainly as much entitled to profit by a foreign advance in military organization as the Germans were by our riflepits and mounted infantry, as developed in the civil war. Gen. Miles's denunciation of the general staff plan was so plainly inspired by ill-will and was so completely answered by Gens. Schofield and Davis as to have been already forgotten. As for the Representative who declared that the bill merely created a fancy corps of officers to loaf in Washington without anything to do, he apparently had not even read the bill, and had certainly not studied its provisions. The army as a whole will heartily welcome this vital and far-reaching change, the attainment of which seemed quite hopeless five years ago. The only doubt expressed by army officers is whether the general staff will not be used by a certain ring of War Department officers for the continuance of the great influence they now possess, and even to increase it. The answer to this is that any army organization can be perverted if the executive authorities are bent upon having political influences control. If some future President awards the general staff places for purely political reasons, the desirability of the general staff itself will not be affected thereby. Fortunately, President Roosevelt has pledged himself to keep politics out of the army during his administration.

Answers filed on Monday by the railways to the Interstate Commission's inquiry regarding the rate advances, follow closely the line of President Ramsey's statement of last November. The Norfolk and Western replies that, since 1899, the company's annual bill for coal has increased 53 per cent., gasolene 100 per cent., nails 116 per cent., pig iron 124 per cent., coke 300 per cent., freight axles 70 per cent., and other materials in proportion. The Baltimore and Ohio, speaking more generally, declares that rise in cost of materials, during the two past years, has ranged from 39 per cent. for cotton waste to 164 per cent. for linseed oil. Mr. Ramsey's comparison, it will be recalled, was with 1897; since when, according to his company's figures, total annual cost of material and supplies had risen 237 per cent. Within the same time, average freight rates per ton per mile, and average passenger rates per mile, had decreased 10 per cent. In view of the fact that a very considerable increase in wages, even above the high rate already prevalent, has just been granted, the companies maintain that the raising of rates is fair and just. We fully agree with their position in this regard, and we are confident that the Commission will similarly endorse it. The proposed advance in rates is so far from a radical or extortionate measure, that it does little if anything more than restore the tariffs in force a year or two ago. If the railways were merely arguing that they ought to have a larger share in the profits of "good times," their position would be open to criticism. The more puzzling part of the question is, whether increased revenue, due to higher rates, will or will not offset increased expenses.

Gov. Odell's declaration, on Saturday, that he was in favor of Platt's reëlection, and that he would do "all in his power" to bring it about, was instantly branded as tricky and insincere in the columns of the *Sun*. But is it not degradation enough to have been compelled to come out for Platt? By so doing, Mr. Odell has made it evident that, to carry out his own plans, he is willing to consent to an act which he knows to be both harmful to the State and repugnant to the moral sense of his party. He is ready to sacrifice party morality to party regularity, and to follow a boss instead of convictions. There is, of course, nothing surprising in this to those who have watched Gov. Odell's recent course. His former readiness to appeal to the best elements of his party and of the State, he has shown increasing signs of intending to abandon, and to make himself simply a politician in office, prepared to stoop to any alliance to further his ends. This is bad enough, but we will not assume with the Platt organ that he means secretly to work against the man whose election he professes to desire.

We observe that the revolt of the three Republican Senators is proving a serious blow to our esteemed brethren of the up-State Republican press. Editors who have long been accustomed to receive ready-made editorials from the party boss along with their orders for county printing, were quite unable to realize at first that their mentor and benefactor was no longer supreme. They generally viewed with contempt the *Evening Post's* efforts to present to the public the truth about Platt, simply replying that he would be reëlected without Republican opposition. Doubtless they were instructed to this effect. A few grew suspicious even before the revolt, but when that came, panicky conditions developed rapidly, as they say in the market reports. Ready-made editorials were hastily removed from the forms, and innocuous discussions of such topics as "The National Debt of Turkey," "Arbitration in Germany," etc., were substituted. Editors who were bold enough to comment on the revolt at all, exhibited diplomatic tendencies. While deprecating any interference with the carrying out of Republican politics, they hastened to draw attention to the fact that the three Senators were still Republicans, having refused to join with the Democrats in electing the President *pro tem.* The attitude was one of mild rebuke which, if need be, could be shaded off later into acquiescence. Meanwhile, between every two lines could be read the question: Who is behind it all? They are still asking the same question.

Gen. Greene's conception of the duties of a Police Commissioner is certainly an original one, as Commissioners go in this city. He actually sees for himself whether the laws are enforced on Sunday, and has no hesitation in suspending without pay a captain in whose district he found an open violation of the liquor law. Moreover, he suspended the offender in his own station-house, where the latter was caught performing police duty in street clothes. If this official is promptly tried and punished, the effect upon his brother officers should be electrical. While Gen. Greene has as yet made no statement of the Administration's present intention in regard to the enforcement of the Excise Law, his actions are beginning to speak louder than words. He stated on Sunday, moreover, that New York would still be far from a "dry" city on Sunday if the law should be rigidly enforced. By this, we take it, he meant that the Raines Law hotels would still give abundant opportunities to those who must indulge in spirituous liquors every day in the week. This is a point the public constantly overlooks when mention is made of a general Sunday closing.

To be sought at once by District Attorney Jerome and by the greatest living painter must be counted a distinction, and Mr. Richard A. Canfield, as he sits for Whistler in London, may have a certain satisfaction in the thought that the District Attorney is "laying for" him in New York. A man hardly changes his heart with his residence; but Mr. Canfield abroad gives simply an impression of intelligent connoisseurship; at home

he looks like a rather common proprietor of a great gambling establishment. It is fair to say that he has never played the collector against the croupier. His patrons are not of a kind to be attracted by his Chippendale furniture or his impressionist landscapes. His patronage of art is at least disinterested, if he does keep roulette wheels and the like behind his arras. There need be no confusion of mind in distinguishing between the accomplished amateur and the proprietor of various gaming "clubs." Mr. Canfield has never confused the two characters. We do not know where Mr. Canfield's pictures and porcelain are going, or what will be the end of Mr. Canfield the collector. If it were certain that his art treasures were going to the Metropolitan Museum, and he himself to heaven, we presume that the District Attorney still would exert every effort to send him meanwhile to State's prison. Stone walls may not a prison make, nor iron bars a cage for the art patron; for the gambling-house proprietor they will do very well indeed.

A report made to Mayor Low by the Municipal Art Society recommends the appointment of a commission to consider broadly the judicious development of the city. The need of a comprehensive plan of public improvements becomes greater as the growth of the city becomes more rapid. Already lack of foresight in providing for parks and public-building sites alone has cost New York millions of dollars, and the preliminary project of the Municipal Art Society, though it certainly calls for vast sums jauntily enough, might easily prove an economy in the long run. The commission which the Mayor is asked to appoint would not be in any exclusive sense an art committee. It would study all matters that affect primarily the appearance and, next, the convenience of this city. Thus it would not only deal with parks, public buildings, and monuments, but would also coöperate with the bodies which have the control of the rapid-transit system and of the river front, to the end that all public improvements be carried out with an eye to the sightliness of the city as a whole. It will be felt that the usefulness of such a commission will depend upon the sagacity with which it keeps clear of fads and remembers the present condition of the city treasury. On the artistic side, such a commission could give the Mayor valuable suggestions; on the business side, it would do well to work upon lines of expenditure laid down by him. Otherwise there will be no check upon planning costly castles in the air.

The Statute-Revision Commission of Minnesota has discovered a way to remedy a defect in the direct-nomination law. When it was first applied in Hennepin County, the Australian ballot provisions were adhered to strictly, each voter at the primary receiving a ticket which bore the names of the candidates of all the parties. This furnished the opportunity for unscrupulous voters in one party to foist on the other party the weakest of its candidates—a trick which the Minneapolis Democrats are said to have played on their political opponents. It was a game at which two could play, and it was apparent that a law framed to secure the best nominees might be perverted to choose the worst. Even the most strenuous of ballot reformers had to consent to a division of the primary tickets by parties, the limitation of each voter to one ticket, and a declaration by him of party affiliation. Abandonment of the secrecy of the ballot was a smaller evil than the other. Now, by a simple device, both evils can be cured. The commission is to recommend that all the tickets be printed on one ballot, but that a voter be restricted to "checking" the candidates of one party only, any attempt to "split" the ticket making it void. Adoption by the Legislature of such an amendment would meet a general criticism, and increase the interest in the Minnesota experiment.

A time-honored vicious circle appears in rejuvenated guise in the first annual message of Gov. Bates of Massachusetts. Speaking of State contracts, he declares that to award them outside the State reduces prosperity, which reduces taxable resources and, consequently, revenue. On that theory, the more you save money by accepting bids from foreign contractors, the more you impoverish the State and impair its ability to meet its contracts. *Vice versa*, by spending enough money at home you can increase your revenues indefinitely. Such, in its crudest form, is the familiar doctrine of keeping the money, or the trade, at home. But Gov. Bates has worked out a calculus by which State boards may be guided in concrete instances.

> "Boards and commissions should make certain, when work is awarded by them to contractors outside because their bids are less than the bids of those within the State, that the saving to the Commonwealth is sufficiently great not only to pay the extra cost of inspection of the product thus manufactured at a distance, but also adequately to compensate the Commonwealth for its indirect loss through the loss to its own wage-earners by reason of the work being done elsewhere."

It might be objected that the calculation of the "indirect loss" on a given contract is a difficult one. Should this be said, Gov. Bates has still another reason for keeping the contracts at home. Bids by contractors from States which have other labor laws (permitting longer hours of labor, for example) than those of Massachusetts, are in the nature of the case suspect:

> "In other words, it is unjust to our own manufacturers to require them, while conforming to the laws of our Commonwealth in regard to the employment of labor, to compete with outside manufacturers who do not conform to such laws, and who, for that reason alone, are able to underbid our own manufacturers in the competition."

Here again is a calculation which it would baffle a trained statistician to make with accuracy. Massachusetts contractors are not likely to suffer under the test either of "indirect loss" or unfair competition. This economic know-nothingism of Gov. Bates comes with singular ill grace from the chief executive of Massachusetts.

The *National Geographic Magazine*, Washington, for January, appears to be in a mood of sardonic humor akin to that of the ancient Sphynx. It propounds, on a postal card, a series of riddles that nobody can possibly answer. The first one is embraced in the title of a so-called note: "Is Germany the cause of Denmark's refusal to sell her West Indian possessions?" Of course, nobody who knows the damning facts is going to reveal them, and nobody else can. Assuming, however, that Germany has been guilty in this particular, the next question comes: "Why?" What was her motive for thus interfering with *our* purchase of those islands? To this question the national geographer gives his own answer, thus:

> "It is well known that Germany has always wanted Denmark, and if, by some peaceable means, the kingdom of Denmark should become a state of the German Empire, the Danish West Indies would not have changed sovereigns, but yet the German fleet could have its station there."

Which would, of course, make us all shake in our shoes. For, although England has had us hemmed in by naval stations at Halifax, Bermuda, Nassau, and various other neighboring places for more than a hundred years, and we have never considered ourselves in any danger therefrom, yet if Germany should have one station in West Indian waters what would become of the universal Yankee nation? But the last geographical query is the one which stumps us, namely: "Would the Monroe Doctrine interfere with this arrangement?" More than usual gloom attaches to this problem because, in order to answer it, one must know what the Monroe Doctrine is. As we do not know, and as we consider the question put to us at our peril by virtue of the postal card on which it comes, we answer it by asking a few others, viz.:

> "If England and France should have a war, and England should capture all the French West Indies, would the Monroe Doctrine interfere?
>
> "If France should capture all the English islands, would the Doctrine interfere?
>
> "If each of the belligerents should lose its own islands and capture the other's, would the Doctrine have anything to say about that?"

There are Swedish and Dutch islands in Caribbean waters also, but we shall not put any more cross-interrogations to the Sphynx till the foregoing are answered.

THE PRESIDENT'S MINIMUM.

We could barely mention last week the authorized statement from the White House of the least that the President will accept from Congress in the matter of anti-Trust legislation. It must be, to his confident Western admirers, a disappointing minimum. Is the whole valiant programme of last summer to be whittled down to this? All that the President now urges is such an amendment of the law as will prevent common carriers from giving rebates or making discriminations. This, and a commission of inquiry, is the sum of his asking. The Republicans in Congress will, no doubt, give him his commission. Inquire till the crack of doom, provided you do nothing. Commissions mean salaries, and as for salaries, Congressmen have a vested right to place them where they will do the most good. Whether the President will obtain his desired legislation to prevent "discriminatory practices affecting interstate trade," is much more doubtful. He will not if the Republican leaders think that thereby the interests of their clients, the Trusts, will be at all threatened.

This is the great truth which Mr. Roosevelt is in the painful way of finding out. He is in the hands of his enemies. The managers of his party have not the slightest idea of accepting his plan of campaign against the Trusts. They will listen to him, they will humor him, they will praise him; but they will do nothing. This is the ugly fact which, in Huxley's phrase, is killing the beautiful theory of President Roosevelt. His announcement of what he will take to cry quits, is necessarily written *diminuendo*. It threatens him with classification in his own category of contempt—"men who mean well but cannot do things." At best, and on his own showing, he is but a half-way doer, and cannot blame us if his Trust thunderings in the index, compared with his final pleas, remind us of the lines in the *Anti-Jacobin:*

> "That ardent soul
> Who went on half a mission to the frozen pole,
> And then returning from th' half-finished work,
> Wrote half a letter to demolish Burke."

If it be said that the President has, in the end, discovered the immense difficulty of drafting a law to reach the evils of Trusts, the proper comment is (1) that he should have thought of that at the beginning, and (2) that he should not have put away the one definite remedy which lay at his hand, and which could have been enacted into law by a bill of three lines. We mean, of course, the shearing away of the tariff privileges of Trusts. But that did not enter into the President's soaring thoughts. His mind was filled with the idea of regulation, and publicity, and the prevention of over-capitalization, and discrimination between good monopolies and bad ones. But all of that he has now thrown by the board, and calls upon Congress to prevent Trusts from enjoying railway rebates. On these, he says, they "fatten." Possibly, but we know that some of them fatten on tariff duties, so why not ask Congress to apply the Banting method to them at that point, too?

The reason given by the President in his message—repeating the cry first raised, we believe, by that sworn enemy of monopoly, Senator Aldrich—was that "the small producer" would suffer if the tariff advantages of Trusts were cut off. But observe how his more recent statement utterly refutes this former argument of his own. "Small enterprises," he now says, "have certain advantages over large combinations, and will *live and thrive if assured of an open and fair field.*" Not a word about the tariff as the parent of their prosperity! The Attorney-General is even more explicit on this point. "Small individual enterprises not uncommonly spring up and thrive within the shadow of the larger ones, . . . realizing large profits because of the close economies possible through direct, personal, interested management." At one blow the boasted superior economies of Trusts knocked on the head, and the last vestige of brains dashed out of the "small producer"! It is time this defunct fraud were decently buried.

"I can easily," said Senator Hoar last week, "understand the impatience and indignation" of men who see "an artificial being, with an artificial capital and an artificial stock, crushing out all domestic competition by an adroit and illegal artifice, and getting control of the home market." We should think so, if he reads the Massachusetts papers! And the venerable Senator said that he did not "wonder" that the remedy of removing the tariff had "occurred to some good men." He said it was even "worth thinking of," which is a great concession from so stiff a protectionist. But he thought he could find a "better" remedy—namely, in that anti-Trust bill of his own, of which he presently said that it was "exceedingly imperfect," might need to be modified in "all of its provisions," but was "all I have to offer to-day"! This is to make the whole anti-Trust movement ridiculous. President Roosevelt, after frank abandonment of his original grandiose programme, and his humble request for one crumb of comfort in the shape of legislation against rebates, cannot shut his ears to the rising cry for relief by the route of tariff legislation, without bringing his own sincerity under grave suspicion.

EFFECTIVE PUBLIC SPEAKING.

Senator Vest, whose mind burns clear in the midst of his failing bodily powers, has just shown, in his running debate on the coal tax with the Republican all-comers, what degree of truth there is in the current laments about the decline of oratory. An orator in the traditional sense Mr. Vest never was, even in his prime. He had neither the physical presence, nor the voice, nor the personal magnetism—nor even the finished rhetorical art—which we associate with great public speaking. But he was always a formidable debater; and the ready way in which he bowled over one Republican Senator after another, and the eager attention with which this feeble old man was listened to by both floor and gallery, bore witness to the fact that decay had not yet touched his nimble intellect.

What are the qualities which make his antagonists dread him? First—and especially in tariff questions, where he has ever been masterly—sound information. He knows whereof he affirms. Many a glib protectionist, like Senator Hale on one occasion, has had reason to regret challenging Senator Vest's accuracy. He goes documented as a cowboy goes armed, and the result of an encounter is as dangerous in one case as in the other. Then he is perfectly fearless and honest. He is willing to tell the truth and shame, not merely the devil (many a man is ready to do that), but, what is much rarer, shame his own party. Otherwise, he could not have made so overwhelming a retort as that with which he silenced Senator Aldrich. That gentleman took occasion to sneer at Mr. Vest's free-trade opinions, as held "only when they did not count." Why had not the Democratic party, when in power, done what it now rebuked the Republican party for not doing? "We wanted to," was the Missouri Senator's response, as swift as lightning, "but the same interests which you now represent 'held up' the Senate then as they are doing to-day." What are you going to do with a man who thus speaks the thing he will, whether girt by friend or foe? In biting description, too, Senator Vest has a tongue to make corruption wince—as witness this condensed and truthful account of a protective tariff:

> "I have had occasion to say, and I repeat it deliberately, the tariff is an interdependent mutuality of greed. When you once establish it, it is established for all time to come, never to be reduced if it is possible to prevent reduction. The protected industries are like a brood of English sparrows. When one gives a cry of distress, the air is darkened with the whole brood rushing to its rescue."

By an instructive coincidence, we find Justin McCarthy writing in last week's *Outlook* of a speaker who has the ear of the House of Commons in as remarkable a degree as Senator Vest has that of the Senate, yet who is also no orator, in the conventional meaning of the word. It is Mr. Bryce of whom he is speaking. This scholar, this professor, who uses a conversational tone and discards all oratorical graces, fills the House with interested listeners as can few men not members of the Government and speaking with the weight of official authority.

Let the word go round the library or smoking-room, "Bryce is up," and there is a rush into the House. Everybody knows that he is speaking because he has something to say. Mr. McCarthy reports hearing Conservative members grumble a little at being compelled to drop book or letter or cigar and hear a man whom they could not afford to disregard. "Bryce is on his legs—I must go in and hear what he has to say."

Here again we see the power of solid information and intellectual honesty to command a hearing. It has been said of Lord Brougham's highly wrought and prolix oratory that the listener was sure he was being bored, and was not sure he was being instructed. But the man who is saturated in matter, as Mr. Bryce is, leaves no doubt on the latter point. The speaker who knows, who can condense and still be lucid—avoiding that chief sin of "putting a plain thing so as to perplex and mislead a plain man"—need complain of no decline in the effectiveness of public oratory, whatever be his audience.

If there be, indeed, any real decline in Congressional or Parliamentary speaking, we think it is more the fault of the hearer than the speaker. As party tyranny and the caucus control the voting on more and more subjects, the main nerve of oratory—the desire to persuade—is more and more cut through. "You have changed my convictions, but not my vote," is a compliment which may provoke a smile on the face of the powerful debater, but it certainly will not encourage him to renewed effort. Gladstone's oratorical impulse was brilliantly analyzed by Bagehot; he believed he could convince his audience; "he knows an argument which will be effective, one for one and another for another; he has an enthusiasm which he feels will rouse the most apathetic, an illustration which he hopes will drive his meaning into the heads of the stolid." But suppose the orator knows that the weight of voting is absolutely determined in advance, no matter what the weight of argument be? His only remedy is to speak over the heads of his immediate hearers to the country at large. That, in truth, is the resource to which Congressional debaters are more and more driven. They turn from Senators whose intellects are chained to party, and address the people still possessed of open minds. Otherwise they could not speak at all, except with the metallic iteration of a phonograph. And, as we say, with the persuadable, with those who do not require the orator to furnish them an intellect as well as reasons, there is no real ground for thinking that pungent and informed public speaking has lost its power.

GOV. ODELL'S MESSAGE.

By his message, Gov. Odell has practically washed his hands of canal improvement. He has thrown the entire responsibility on the Legislature, where, indeed, it properly belongs, carefully refraining from specific recommendations of his own. He does say that he favors the 1,000-ton barge canal, and that he has become convinced that the only feasible route is along the more costly interior line; but while affirming these conclusions, he presents to the Legislature the most serious arguments against any large expenditures for canal improvements. He gives also the details of a plan for increasing the speed of canal boats through a nine-foot waterway, by the use of electric motors served by water power supplied by the State. He computes the cost of the proposed barge canal, adding together the original estimates and the interest charge for fifty years, with an allowance of 20 per cent. for contingencies, and arrives at the somewhat startling sum of $255,000,000, from which, however, he states that the interest on the sinking fund should be deducted.

These figures are certain to have a very chilling effect upon rural members who might be inclined to support the canal bill. On the other hand, it should be remembered that nothing could more seriously menace the ultimate success of canal enlargement than another attempt to belittle its cost. The blow at the canals dealt by those who, in 1895, carried through a $9,000,000 appropriation, knowing that the amount was hopelessly inadequate to accomplish the work proposed, was well-nigh fatal. The Governor evidently intends that no such mistake shall be made again. It seems hardly fair, however, to lump the principal and interest together and call the result the total cost of the canal, without making any account of the benefits derived from the work concurrently with the payments of interest. Engineer Bond estimates the cost of the interior barge canal by the present route modified, at about $80,000,000. It is true that this sum, with the aggregate of the interest for fifty years added, would amount to $200,000,000, but only the $80,000,000 would represent bonded indebtedness. The interest during the entire fifty years might or might not be a charge which the people would have to pay. If tolls were reimposed on the completed canal, or if some other system were devised for collecting the interest and maintenance cost from the canal traffic, it would not be a charge upon the State, and it is therefore clearly misleading to embrace the original cost and the interest as a single item.

There is a touch of unconscious humor in the Governor's warning against hasty conclusions as to the proper remedy to be applied. The canals are to-day substantially as they were in 1862, with the exception of a few improvements in locks and the worthless construction under the $9,000,000 appropriation of 1895. The subject has been considered in one form or another almost every year since 1862. This does not indicate any great danger of drawing hasty conclusions. The fact is, moreover, that every possible excuse for delay has now been exhausted, and all further attempts at postponement must be recognized as hostile to any canal improvement whatever. An expensive survey of all possible routes has been made, a well-equipped commission has reported, all possible data are now available. The question is presented to the Legislature without the embarrassment of specific recommendations from the Governor, such as those of 1901 and 1902. But one thing now remains, and that is definite, final action by the Legislature, submitting some canal project to the people.

Gov. Odell's recommendation of the repeal of the Special Franchise Tax with substitution in its place of a tax on gross earnings, has started a fresh discussion of a subject which had fallen into comparative neglect. Everybody knew that the matter was before the courts on questions of Constitutionality, and everybody had confidence that these would be decided rightly in the course of time. There was no disposition in any disinterested quarter to abandon the principle of the franchise tax merely because the machinery for carrying it into effect might be pronounced obnoxious to the Constitution. On the contrary, the settled opinion of the State was in substantial agreement with that of Gov. Roosevelt, as declared by himself in an interview at Rochester shortly after the present litigation began: "The franchise tax has come to stay." Now Gov. Odell says that the franchise tax seems to him, through the few years that it has been in operation, to be "inequitable and a source of annoyance and constant litigation." A tax is usually an annoyance to those who are called upon to pay it. There is constant litigation on the subject of taxes of all kinds. The litigation referred to by the Governor was not instigated by the public authorities. It was not of their seeking. If blame is to be cast on anybody, it must fall upon those who procured the amendment of the law and then attacked it on the ground that the amendments were unconstitutional.

But if we concede that the Special Franchise Tax is a source of annoyance and litigation, is it also inequitable? That question was very fully debated at the time of its enactment, and the contrary opinion prevailed. It prevailed against lobby influences of great strength and skill, backed by all the force of the Republican machine. The bill was passed because public opinion demanded it. It might have been inequitable for all that, but all the presumptions were in favor of its fairness and justice. If anybody affirms that it was inequitable, the burden of proof is on him. The law provides simply that

the franchise, or right to use public highways for certain purposes, such as street railways, pipe lines, conduits, etc., shall be included in the assessments of real estate for purposes of taxation. In other words, this kind of property is required to pay, according to its value, just the same rate of tax as the lots, houses, stores, and factories alongside. Provision is made for deducting any other tax paid by the corporation, and there is not a doubt that all such taxes will be marshalled in fullest magnitude by the corporations before the assessment is confirmed. Nor is there any doubt that full and fair consideration will be given by the taxing authorities and the courts to all such payments. Where, then, do we find the inequitable features of the Franchise Tax Law?

There is a maxim of fiscal science that we ought not to tax the things that can run away or hide themselves. Personal property of this sort does generally escape taxation, either with or without law, and the better opinion of publicists is that no attempt should be made to tax such things, since in the few cases where the tax is enforceable, it falls upon the few citizens who are too honest to dodge their taxes, or upon widows and orphans and the more helpless classes of the community. So the practice in most of the cities of New York is to put five-sixths of the taxes on real estate, simply because real estate cannot depart from the jurisdiction or hide itself, or otherwise escape payment. There is no other reason in the world why real estate should be thus overtaxed, as compared with personal property. The common belief is that the personal property in Greater New York exceeds in value the real estate therein; yet the assessment rolls of the latter foot up $3,330,647,579, while the former stands at only $526,400,139. Now, the franchises to use streets for railway and other purposes stand upon exactly the footing of real estate as regards the reasons for including them in the assessment rolls at their true value: if they are so included, they cannot escape the jurisdiction, they cannot hide, they cannot dodge. This is the very reason why the owners of these franchises fought the tax so desperately. This is the reason why they now want to try some other plan. They want to put themselves back into some category where they will have opportunity to avoid paying a fair price for the privileges which they enjoy. They complain of the great increase of taxation as though they were the only ones thus mulcted. Have the owners of real estate suffered nothing in that way since Greater New York came into being?

SUCCESS OF THE TENEMENT LAW.

It is already evident that the annual battle for tenement-house reform will have to be fought over again during the present session of the New York Legislature. No radical improvement in tenement conditions can fail to excite antagonism. There are the builders, whose profits are in direct ratio to the poor quality of the houses put up; the loan operators, who do a thriving business in financing the builders; the property owners, who sell them lots; the material men, who supply the lumber, brick, mortar, and paint. All these interests are now preparing for another onslaught upon the building-law passed in 1901. In Brooklyn the law was made an issue in the recent election, and in one Senatorial district the successful candidate was avowedly for its repeal. Gov. Odell recommends its amendment, as it was understood he would do, and a bill for that purpose has already been introduced.

Yet opponents of the new law have surely chosen their time badly for a campaign against it. A year ago its success was not clearly demonstrated. At present, however, all that the advocates of the reform have to do is to point to the actual results already achieved. In their light, no reasonable opposition can stand. Despite adverse circumstances, more than three hundred new tenement-houses are now under way in Manhattan and the Bronx. Their aggregate cost is more than $17,000,000. Just now, it must be remembered, the cost of building and of building materials is abnormally high. Slow delivery of structural steel is a constant bar to building operations, and, owing to the condition of the money market, there is considerable difficulty in placing building loans. Moreover, the additional supply of tenement-houses last year was out of all proportion to the immediate demand. When it became known that the new law would be signed by Gov. Odell, there was a scramble among architects and builders to get in plans under the less stringent statute. From January 1 to April 12, 1901, plans for nearly 1,000 new houses of the old type were filed. Of these more than 700 were actually built and thrown upon the market. Yet, in spite of all this, there was a certain amount of tenement construction on new lines last year, though nothing comparable to the marked activity of the past few months.

The new building movement is not confined to any one section. Scores of houses are going up alike for the accommodation of the Hebrews of the lower East Side, the denizens of Little Italy, the negro population west of Seventh Avenue, and the high-class apartment dwellers bordering on Central Park, to say nothing of the constant growth of Harlem. The effect is visible in the real-estate market, where the demand for tenement-house sites is now the most notable factor. The truth is, the builders have discovered that there is a great demand for houses built under the new law. These tenements rent far better than the old type, and there is an active investment demand for them. Last fall the first batch of the new houses—about thirty—was ready for occupancy, and the tenement public was not slow in finding out the difference between them and the old ones. Especially was this true in the congested East Side. There the jerry-builder had been most rampant. On the one hand, the old-time houses of a former prosperous generation have been altered to furnish accommodations for ten or twelve families instead of one; while, on the other, there have been reared, by the hundred, six and seven-story tenements, in which three and four families have been huddled on each floor. Practically no provision for ventilation was made in these houses, and the occupants had to struggle for light and air, as well as for food and shelter. All the new houses, however, contain air courts of a minimum width of six feet, and there is not a window in one of them that does not open directly upon the outer air. The meagre airshafts and dark rooms of the familiar "dumb-bell" type are abolished; the narrow passageways have given place to lighted private halls; the plumbing and the sanitary arrangements are up-to-date.

The eagerness with which the tenement population take advantage of the new opportunities disposes of the stock argument against tenement reform. Its opponents have repeatedly asserted that the tenement population gets as good as it deserves; that it prefers to live in filth; that the ordinary decencies of life, to say nothing of its refinements, do not attract it in the least. Certain mythical bathtubs, installed in model tenements by misguided philanthropists, and utilized as coal bins by the occupants, have always figured in discussions of housing reform. The fact is, however, that there has been little less than a rush for the new houses, and this in spite of the fact that the rentals are considerably higher than in the old type of building. The evidence is conclusive that the tenement sections have been more than ready for these light and airy houses. Nor is there complaint that the renters do not utilize and care for their every convenience and comfort.

What argument there can be for repealing or amending the new law it is very difficult to see. It is one of the greatest steps forward in civilization that we have taken for years. The best class of builders do not ask that it be retraced. They are perfectly satisfied with the new régime. But there is always a certain faction, more noisy than numerous, who object to the slightest official interference with their operations. All improvement in housing conditions has been made, little by little, in the teeth of opposition from this selfish source. Enlightened public sentiment, however, has always routed them before,

and we do not doubt that it will be able to repel their latest attack.

A YEAR'S PROGRESS IN SOUTHERN EDUCATION.

"Unofficial statesmanship" was the name given by Dr. Felix Adler on Thursday evening to the efforts of the General Education and Southern Education Boards to uplift the South; and he added that unofficial statesmanship in various fields is doing more to advance the nation than all the legislators in the Union. Every one who has looked into the activities of these two Boards, or who heard their work described at the meeting in Carnegie Hall on Friday evening, must be deeply impressed with the value of the patriotic and unselfish work being done in their name. They have been still further defined as organized philanthropy working on business lines, and taking advantage of the corporate spirit which is characteristic of the hour in our industrial development.

The field of activity into which these Boards have entered lay ready for tilling when they began their work. The South had already developed leaders who recognized its educational needs, like Dr. Alderman, President of Tulane University; Dr. McIver, head of one of the leading Southern colleges for women; and Dr. Dabney of the University of Tennessee—all among the speakers at Carnegie Hall. They had perceived, moreover, that in this question of education is involved the moral, social, and industrial development of both races which populate the South. Sparsely inhabited in stretches, and with more than 90 per cent. of its people leading a rural life, for the most part wholly out of touch with the outside world, it became evident to those leaders and to the Northerners like Mr. Robert C. Ogden and Mr. W. H. Baldwin, jr., who became interested, that the South needed an educational revival before all else. It is characteristic of the wisdom with which the movement has been launched that it began at once to work through the Southerners whose eyes could not bear to look upon the ignorance, illiteracy, and backwardness so notable in their section. These men are now the active field agents of the new movement. They are on the firing line in a battle for civilization, the echoes of which are to be heard far beyond the shores of our own country. "It is a work," declared Mr. Michael Sadler, a well-known English educational authority, after returning from the South last summer, "which is not merely national, but international, in character."

The General Education Board, which took shape a year ago, but whose home office in this city was not organized until April last, has made the rural school its objective. It supplies the moneys it receives from individuals to the furtherance of this cause; while the Southern Educational Board strives to create a thirst for education throughout the Southland. The General Board early decided that its best way of approaching the public schools was through the State and county superintendents and departments of education. It began at once to arrange for State conferences with these officials in order to explain its objects, to get information as to local needs, and to insist upon the necessity of local taxation for school purposes. Three of these conferences have been held, in Georgia, North Carolina, and Louisiana; those in Virginia, Alabama, and Florida are arranged for. They have already excited remarkable enthusiasm and much valuable discussion, particularly on the subjects of taxation, the education of the negro, the consolidation of school districts, the transportation of pupils, and the beautifying of schoolhouses and grounds. In North Carolina the work of consolidation has progressed so rapidly that the Board's agent is able to report the abolition of one school district for every other day in the year 1902, and the building of a schoolhouse every day in the year.

Each State has its separate and individual problems, every one of which must be carefully considered. In North Carolina, for instance, there is a liberal statutory provision for local taxation. The task here is to induce the districts to vote it. In Guilford County the Board offered to duplicate all private subscriptions up to $4,000 in each district where a special local tax was levied for free public schools. A steady campaign on behalf of local taxation has been made by Gov. Aycock and leading politicians and educators. In Georgia, there being practically no Constitutional permission to levy local taxes for schools, the movement naturally takes on a different aspect. Here the Board has lent its means and influence to the lengthening of the term and to consolidating schools in order to show how little taxation would be required to improve and enlarge them. In this case it has given money only where the citizens have done their share in raising funds.

But the Board has been active in many other directions. It is establishing a model school for negroes near Athens, Ga. Contributions aggregating $60,000 have been made to fourteen schools for colored people, with the special object of educating teachers. Summer schools for colored teachers have been established at Hampton and Tuskegee, and the Board is coöperating with six summer schools for white teachers. It has given varying sums to schools for the training of white teachers, for example, at Athens, Ga., Knoxville, Tenn., Greensboro, N. C., and Troy and Montevallo, Ala. Meanwhile, its New York office is becoming a storehouse of information about every school district and every college or normal school in the South. And this is merely part of the astonishing record of nine months of activity. Hitherto the Board has appealed publicly to no one for financial aid. With its machinery and plans perfected, it will probably call upon every friend of the cause to make it the responsible clearing-house for all forms of education that it ought to be.

Perhaps most important of all is the fact that this undertaking is giving the men and women of the South a chance to aid in the uplifting of their States which is being heartily welcomed by the best elements in every community. It has already inspired many deeds of genuine patriotism. Of this the act of the superintendent of schools who declined a college professorship carrying two and one-half times the salary he was receiving rather than lay down his county work and the agency of the General Board, is merely a type, but a noble one. This readiness to serve the State and one's fellow-men unselfishly is the most encouraging sign of a growing recognition that the educational path is the only one out of the South's overwhelmingly difficult social and industrial problems.

COUNTESS CESARESCO.

CAMBRIDGE, MASS., January 1, 1903.

Why, when women take so easily to novel-writing, in which the fortunes and psychology of imaginary persons are their subject, have they so little desire or power to portray the characters, motives, and acts of real men and women? This question recurred to me again and again in reading the recent volume of 'Lombard Studies,' by Countess Evelyn Martinengo Cesaresco, the only living English woman of letters who has signally succeeded both as a writer of biography and of essays. So little has been made public about the career of this remarkable woman, whose position among her literary contemporaries is now assured, that an outline of it may be welcome.

Evelyn Carrington was born about 1860, her father being the Very Rev. Henry Carrington, Dean of Bocking, Braintree, and her mother, Juanita, daughter of Capt. Haseldene Lyall, of the Royal Navy. The Carringtons are an old English family, tracing back to Norman beginnings; the Lyalls are Scotch—the Red Comyn, Bruce's rival, being among their historic forerunners. More important than this remote inheritance is the fact that Dean Carrington's mother, the grandmother of Countess Cesaresco, was Pauline Belli, an Italian. Pauline's father, Giovanni Belli, served as secretary to Warren Hastings in India, where he became acquainted with Sir Edmund Carrington, first Chief Justice of Ceylon. Pauline Belli and her two sisters, one of whom married Dr. Howley, subsequently Archbishop of Canterbury, were among the great London beauties of their day, and Pauline's portrait by Lawrence, now in the South Kensington Gallery, certainly justifies her reputation. We should add that the Belli had intermarried with the Spanish Bivar. Believers in heredity will find no difficulty in proving that Evelyn Carrington, with such

a mixture of ancestry, was predestined to be a cosmopolite.

An accident in childhood, however, seems to have been more directly responsible for her development. When she was seven years old she suffered from a sunstroke, which fortunately saved her from being put through the conventional education of English gentlemen's daughters. Consecutive study was forbidden; she spent much time out of doors, and had many and strange pets—her fondness for animals, as appears in many places in her works, being almost as strong as her love of the chief human concerns. She had a nook to herself in her father's study, and there she browsed at will—no doubt more under his direction than she imagined. Shakspere she spelled out for herself. This training, prolonged through childhood and youth, seems shockingly desultory to the devotees of routine pedagogy; but in her case it was marvellously successful. By the time she grew up, she knew far more of English literature than most young women, and she had, besides, command of French, German, Italian, Latin, and Greek, using them with the true scholar's ease. Her best teaching came from her father, a man of wide learning, who has made, but not printed, a metrical version of the Greek dramatists, and whose published translations—Victor Hugo's 'Poems,' and 'An Anthology of French Poetry'—show a perfect knowledge of French and unusual metrical facility. But besides book learning, the daughter got from her father an intense enthusiasm for the ideals of liberty—those ideals which thrilled every generous heart in the fifties and sixties, but which have been temporarily eclipsed through the dominance of Germany, with its inveterate love of despotism, its worship of force and of bureaucracy. From infancy she had heard especially of the Italian struggle for independence, a struggle then nearly achieved, which glowed with romance and heroism, and was the work of a wonderfully picturesque group of statesmen and soldiers leading millions of their responsive countrymen to national life. Cavour had but lately died. Garibaldi, a world-hero fresh from the glorious redemption of Sicily, was the idol of the multitude and the terror of ministries. Victor Emanuel, Mazzini, Ricasoli, Minghetti, and the great throng of patriots of the second magnitude, were in full vigor.

> "Bliss was it in that dawn to be alive,
> But to be young was very heaven!"

For Evelyn Carrington, with her Italian antecedents and liberty-loving spirit, the Italian cause and its heroes had an irresistible fascination. It is said that with her first pin-money she bought a photograph of Garibaldi, and it is certain that her earliest printed work, written while she was still a girl, was 'La Famiglia Cairoli,' an account in Italian of the Cairoli brothers, of whom all fought for Italy, several died in battle, and one, Benedetto, survived to be Prime Minister and to receive the dagger thrust which the assassin Passanante aimed at King Humbert in November, 1878. Of this first venture, Countess Cesaresco wrote in the *Academy* (of June 11, 1898), shortly after Gladstone's death:

"My mother and I were at Venice . . . and Mr. Gladstone was staying at the Grand Hotel at the same. My mother had often met him in her youth, when both were the guests of Mrs. Gaskell at Thornes House, and it thus came about that she presented him with a copy of 'La Famiglia Cairoli.' I shall always remember how, with the particular art of giving pleasure which he possessed in so eminent a degree, he seated himself afterwards in the middle of the *salle de lecture*, where the young author could not help seeing him, and spent about an hour in reading the little work, apparently with extreme attention. It was a trait which exactly revealed the man."

In 1882, at Rome, Miss Carrington married Count Eugenio Martinengo Cesaresco, a Lombard noble, whose family for a thousand years has been eminent among the Lombard nobility. "Wherever there was fighting going on, you might be sure to meet a Martinengo. The Lombard plains were not more familiar with the name than were the isles of Greece. Again and again it appears in the struggle of Europe with Asia, which was gallantly sustained from rock to rock by small handfuls of men to whom Christendom gave prayer, tears, and abandonment." One of these Martinenghi, Luigi, commanded the artillery in the siege of Famagosta against the Turks, and was hacked to death when, after a resistance of two years and five months, the Muslim took the city. The Count's father headed the insurrection of the Brescians when in 1848 they threw off the Austrian yoke; and in the following year, when they made their magnificent ten days' stand against overwhelming odds, he was the last to sheathe his sword.

The Count and Countess settled in one of the old Martinengo palaces at Salò, which has ever since been their home. The town of Salò nestles on the western bank of Lake Garda, where the lake is broadest and the last spurs of the Alps begin to melt into the Lombard plain. The palace itself, a large, rambling brick structure, comes by right by its fortress-like air, as it has withstood more than one bombardment; but when it was built, and for more than two centuries thereafter, it was the most famous pleasure palace in northern Italy. Lady Mary Wortley Montagu said of it that even in her time the King of France had nothing so fine, and that it was much larger than the royal palaces of Naples, Germany, or England. The view from it on all sides is superb. The hills among which the battle of Solferino was fought bound the southern horizon. From a little height one sees the promontory of Sermione, "Catullus's all but island," castle-crowned, jutting into the lake. And not far above Salò, as you go northward, the banks become precipitous, and for many miles your steamer skirts a succession of Gibraltars, each higher and more massive than Gib itself. Of the beauty and grandeur of Lake Garda, no one has written so well as Countess Cesaresco in her essay 'Benacus, the Poet's Lake.' and she has told the story of the old palace, and of some of the most striking of the Martinenghi, in her 'Memorials of a Lombard House.' To one of the occupants of the palace—Vittoria Accoramboni, the maligned heroine of John Webster's 'The White Devil'—she has devoted a special article. I say "maligned," because, from the best evidence now obtainable, it seems improbable that the beautiful Vittoria was guilty of those crimes which Webster made the substance of his tremendous tragedy.

It is evident that Countess Cesaresco plunged heart and soul into her new life. She sought eagerly to know the condition of all classes of the people among whom she was thrown, and she found, as others have found, an inexhaustible charm in the Italian nature. She travelled much, visiting every part of the peninsula, with trips to Sicily, Sardinia, and Corsica, and longer tours to the Levant and Western Europe. Her intercourse with England was uninterrupted, her journeys home frequent. Thus she kept abreast of the contemporary history and literature, not only of her adopted country, but of England, and the larger interests there; and she studied with insatiable curiosity in many fields.

It was in 1886 that she issued her first mature book, 'Essays in the Study of Folk-Songs,' a model of the way in which a vast store of various information can be presented with unfailing vivacity. The Countess speaks as a specialist, but with so much charm that she can hardly fail to attract any cultivated reader. As her book was printed by an obscure London publisher, it had, I suppose, no wide circulation; but more than one copy fell into the hands of discriminating readers. Among these was the late Prof. Francis J. Child, who praised it highly, both for its excellence as a contribution to the study in which he was master and for its literary merits. His praise makes others' superfluous.

In 1890 appeared her 'Italian Characters in the Epoch of Unification,' in which, as Mr. Gladstone remarked, she wrote like a "practised biographer." The book contains sketches of Ricasoli, Settembrini, Giuseppe Martinengo, Manin, the Poerios, Constance d'Azeglio, Mameli, Ugo Bassi, Nino Bixio, and the Cairolis—a group of sufficiently dissimilar persons to test the skill of any painter. Several of these personages she introduced for the first time to English readers; into all of them she breathed the breath of life. Her portraits of Ricasoli, the Tuscan Puritan, with his passion for integrity and his beautiful devotion to his daughter; of Marchioness d'Azeglio, the Piedmontese *grande dame*, witty, far-seeing, full of sense, patriotic; of Mameli, the boy poet, dying in defending Rome; of Bassi, the patriot priest, whom the Austrians shot like a malefactor; of the wise and unselfish and enduring Manin—these are some of the faces in her gallery which one does not forget.

In her method the Countess reminds you of Plutarch; for, instead of a chronological narrative, she picks and chooses, giving you the vital facts, letting you see her subject at a critical moment or in his characteristic actions, preferring an anecdote to a date, leaving on you such an impression of genuineness as the high creations of the artist leave. The essays disclose their writer's very wide sympathy; they abound also in keen criticism of men and politics. She has at her command an unusual reserve of irony. She is enthusiastic, partisan if you will, because she would not condescend to waste her time describing characters for whom she felt no enthusiasm. The book is almost invaluable for the student of the Italian Regeneration, because, while only Count Martinengo's features were drawn from life, the writer had access to many unprinted sources, and, above all, she had the unwrit-

ten recollections of many of the companions of her heroes, with which to vivify or chasten her own impression.

Her next book, 'The Liberation of Italy, 1815-1870,' printed in 1894, is a popular account of the unification of Italy, and it is still the best short history of the period. Had its author produced nothing else, this would have distinguished her as possessing a rare combination of literary charm and historical insight. It would also have placed her in the company of two other English women who have done Italy a great service in interpreting Italy to English readers. One of these, Jessie White, wife of Garibaldi's lieutenant Alberto Mario, took part in the events of forty years ago, has written the lives of Bertani, Garibaldi, and Mazzini, and has long served as correspondent of the *Nation* and of English journals. The other, Linda White, wife of Pasquale Villari, the dean of Italian historians, has translated her husband's principal works. It would seem that in some English natures there is an affinity which lets them into the secret of Italy.

Countess Cesaresco's 'Liberation of Italy' lacks the highest constructive historical qualities, but it has the highest moral quality in a history—justice. To each of the great factors in the result—to Victor Emanuel and Cavour, to Mazzini and Garibaldi—it allots fair praise. And there are in it divinations like this, which outvalue many pages of ordinary historical writing: "The Italians are not a mystical people, but they have always followed mystical leaders."

But her short history proved to be the stepping-stone to a book of far higher excellence—to her life of Cavour in the Foreign Statesmen Series, which has not, to my knowledge, a superior in English. How good it is will be apparent to any one who cares to compare it with Freeman's 'William the Conqueror,' or Creighton's 'Wolsey,' or Mr. Frederic Harrison's 'William the Silent,' all of which have a similar range. Countess Cesaresco, in her 'Cavour,' has mastered the art of presentation, and attained to a symmetry, rather French than English, beyond the reach of any of these. And although her little book is all pith, it has that ease, that absence of laboriousness, by which real achievements in art are recognized. Countess Cesaresco has not only created literature, she has made a fine portrait of the great statesman who ranks with Napoleon and Bismarck in European history in the nineteenth century. She has succeeded in unfolding Cavour the man and Cavour the statesman, and in defining the scope of his influence in the political evolution of his time. Those best acquainted with the subject will best understand how many books went to the distilling of this short biography. Every sentence in it tells. It is the best brief life in English of a *dynamic* statesman, as Mr. John Morley's 'Burke' is the best brief life of a *philosophical* statesman.

The 'Cavour' was published four years ago, and now, in the late autumn of 1902 comes Countess Cesaresco's fifth volume, 'Lombard Studies,' a collection of essays, on many themes (Scribners). She describes Lake Garda, the Franciacorta, Rimini, and Lake Iseo; she tells the story of the Martinenghi; she reviews Arthur Young's 'North Italian Journey'; she brings together in a single paper all the known facts about Vittoria Accoramboni; she treats of Lombard agriculture; she criticises the popular stage, and gives in epitome the annals of La Scala Theatre. A varied programme, surely; but it is the method, and not the variety, that counts. One perceives that many of these are essays of high literary quality, not written to order, but for the love of it—in which experience, travel, observation, culture overflow for our delight. At their best they resemble, as literary essays should, the best conversation. They are now sprightly, now serious; they do not insist too brusquely even in enforcing an argument; in them a bit of landscape, a reminiscence, a literary or historical allusion, is introduced naturally, by the way, and then dismissed. If you have caught the point, good—for there is no stopping to explain; the conversation moves swiftly on into other channels. Take a single example: Speaking of the many modern plays based on the story of Francesca and Paolo, Countess Cesaresco says:

"Of the first in the field, Silvio Pellico, Foscolo said severely that the young man would have done better to leave Dante alone. It is very likely that from his classical standpoint he would have passed the same judgment on Leigh Hunt, Stephen Phillips, Gabriele d'Annunzio, and Marion Crawford. But, perhaps, Dante himself would not have complained. At any rate, his is the triumph, for there is one moment in the five plays at which the audience is lifted into an emotional seventh heaven nowhere else approached; the moment when each author introduces Dante's words and Dante's scene of the reading of the fatal book! Whatever else fails, that never does."

The artist's touch, unmistakable in this passage, characterizes the entire volume. The essays have, moreover, a very strong personal coloring. They are not abstract, or theoretical, but the concrete opinions, emotions, preferences of precisely the Countess Cesaresco, and no other. The 'Cavour' was objective, almost classic in its terseness; but these essays are subjective, as they should be, and reveal to us a strong and rare personality. The keen and inquisitive mind, hungry for knowledge of every kind, has its counterpart in capacity for high emotion. The revelation of individuality delights us; we are drawn from the book to its author.

Such, told very briefly, has been Countess Cesaresco's achievement. Although it is too soon to pass a final judgment on it, we already mark its versatility, its vitality, its charm, and its excellence, in fields where women have too seldom competed successfully with men. As the Countess is just in her prime, we may hope for other fruits of her extraordinary talents.

WILLIAM ROSCOE THAYER.

A MODERN MIRACLE PLAY.

LONDON, December 19, 1902.

Few plays have been more talked about and looked forward to with greater interest than Mr. Lawrence Housman's "Bethlehem." In the late summer, announcements of its coming production in London were issued. In the autumn, just as rumors were spreading that rehearsals had begun, the censor refused a license on religious grounds, and his refusal really was an excellent advertisement, for he could not stop the performance, and, by closing the regular theatre to the "Nativity Play," called special attention to it. For months beforehand, reports that American managers were in keen competition for American rights were circulated. Then there was the curiosity to see the author of 'An Englishwoman's Love Letters' in his new rôle of religious poet, while the fact that a supposed rising genius was to produce the scenery and pictorial effects was considered by some people to be a matter of almost national importance. It is only a few years since the Art Workers at the Guildhall revived the old Masque, and showed what a body of artists, working together, could do to give new life to a forgotten dramatic form. The Elizabethan Stage Society had also shown what could be accomplished by following tradition without any scenery at all. A wall for them was a wall, and nothing more; a camel was a camel. But the Masque allowed free scope for spectacular as well as dramatic splendor, and the efforts of the Art Workers were not without results. Even such an exploiter of the footlights as Mr. Beerbohm Tree called in one or two of their number to help him in the production of "Herod"—with indifferent success, because he could not entirely renounce the professional traditions he loves and suppress himself, as an artist would, for the sake of the picture; as a consequence, he and his methods predominated the play, and, pictorially, it was a failure. Other Art Workers were commissioned to design the costumes in the conventional spectacle, but all the surroundings were so inartistic that their work did not tell. Mr. Gordon Craig, on the other hand, endeavored to carry out their ideas in the staging of Purcell's operas, and it was to Mr. Gordon Craig that Mr. Housman entrusted the scenic arrangement of his "Bethlehem." What was expected then was a modern adaptation of an old Miracle Play, made into a series of beautiful pictures for the benefit of a modern audience whom the old religious theme might or might not have the power to thrill.

The first of a short series of representations was given in the large hall of the Imperial Institute (now the University of London) on Wednesday evening, the 17th. The play itself has been published by Macmillan, and its argument can be briefly put. In the first scene, the shepherds see the star, and the Angel Gabriel brings them the glad tidings; in the second, the three Wise Men come from the East, following the star, and Gabriel sets them on their way; in the third, Mary and the Child, with Joseph, in the stable, receive the homage and gifts of shepherds and Wise Men. It is the old story that, since it was first told in stern reality under the skies of Palestine, has been retold again and again in verse and in paint; and the penalty Mr. Housman pays for choosing such a theme is that his version cannot escape comparison with the many that have been, more or less, his inspiration. He has kept close enough to the original Miracle Plays not to attempt the local color and exact detail now too often thought indispensable in poetry and art. His shepherds might watch their flocks anywhere, though it is true that, out under the stars, they talk a dialect said to be Shropshire, though not easily identified, and not worth identifying, as it is quickly dropped for Irvingese when they really have anything to

say; his Magi and Holy Family belong to no special country or period. The whole is supposed to be treated symbolically. Nor should this be a drawback. Nowadays, art is too often sacrificed to archæology. But if Mr. Housman has avoided one pit, he has fallen headlong into another still deeper. For in trying to imitate the naïve simplicity of the old Miracle Play, he succeeds only in producing an affected, artificial, and self-conscious travesty. His lines are seldom musical, never impressive, and frequently, if not absolutely profane, they almost verge upon the farcical, as when, in a chant of the angels, the line "Ding dong bell" recalls the old nursery rhyme. At times, indeed, the verse suggests a jingle from 'Alice in Wonderland' into which Biblical expressions have been woven. I am writing of the play, however, as seen on the stage, not read in the book. But there can be no question that Mr. Housman's chief concern was with its dramatic representation, and it may be that much of the verse was written simply for adaptation to the music.

To come, then, to the performance. A little theatre had been made, as it were, within the great hall, and the seats were arranged in a canvas enclosure, evidently a marquee that had seen much service before. The first impression on entering was that one had come into a badly arranged circus tent. The stage was like a large box with an oblong opening, the walls and curtains of some dark material, more or less translucent. Outside the curtain, on either side, were minor stage entrances. I describe all this because it prepared one for a simple imitation of the early crude and miniature methods. The scene of the Shepherds, after "Chorus" had explained the action to the audience, might, in the description, seem as faithful and simple a copy, for above the group, huddled in a very out-of-place British sheepfold, with most real British hurdles, was a blue curtain, with six little holes in it, through which lights glared and flickered. If, in the manner approved by Bottom, the curtain had been labelled "This is a curtain," and the holes "These are stars," and the folds "These are not folds," one would have thought no more about it, and accepted the convention willingly as a protest against the exaggerated stage realism of the day. But this was by no means the simple effect desired. There was an only too obvious play of the electric light upon the curtain, a too obvious seeking, by means of shadows and a suggestion of mystery, to create effects so essentially modern that already one critic has described the background as a "miraculous blue nocturne"—though another, less respectful, has seen in it nothing but a bit of Liberty, up-to-date, iridescent portrait-painter's costume, out of which most of the spangles have dropped. And with the posing and grouping of the shepherds, dressed in brand-new meal sacks; in the tripping angels, fresh from the ballet, led by Gabriel, and all clad in draperies that seemed to have come out of the rag-bag; in the sudden radiance falling upon Gabriel's head and killing everything else; in the entrance of the Wise Men, the first of the three blacked like a negro minstrel, and all dressed in patchwork quilts—there was the same pretence of primitive simplicity with the same self-conscious straining after anything but primitive effects. One felt that, had a competent artist directed the stage management, beautiful pictures might have been obtained by the massing of colors, the lines of the different groupings, the play of light and shadow. As it was, the electric light constantly destroyed the illusion and revealed but the cheap and yet ambitious design, and lines and color were left to take care of themselves.

After a grand march round, recalling inevitably the Wild West, the first act and second scene came to an end. In the second act, one was first shown a view of Bethlehem and its gates, through which "Chorus" could barely squeeze, reminding one of the struggles of the man in the old Swiss weather-house, while the architecture was a mixture of "l'Art Nouveau" and Burne-Jones at his worst, and the lightning suggested the spectre of the Brocken; the shadows being far more important than the buildings that cast them. And then came the climax—the manger in the stable of Bethlehem. Here, again, it was unnecessary to produce a strictly Oriental scene. But it is difficult to understand why, if the traditional stable, with the ox and ass, were not to be represented, such pains were taken to give a Greek or Roman amphitheatre, in which the actors, mistaking themselves for the audience, came and went and posed upon the steps around the Virgin as she knelt upon the floor, bending over the invisible Child. For this Virgin one cannot readily forgive Mr. Gordon Craig. Though from innumerable Old Masters he might have borrowed models of beauty and simplicity and reverence, he could conceive of nothing nobler than a figure arrayed in the garments of Loie Fuller; and, from the moment she appeared until the end, the play was but a succession of tricolored limelight effects, apparently based on the methods of that famous American in her music-hall dance. To the devout, nothing could well have seemed more profane, unless it were the dismissal of the audience by "Chorus," an amateur mummer, with the benediction of the Church. In the old Miracle Play, organized and sanctioned by the Church, as still at Ober-Ammergau—or so I am told—the sincerity of everybody concerned makes all the difference. But in the modern imitation or deliberate adaptation, where nothing is quite genuine, from the attitude of the author to the interest of the audience, it is another matter, and I confess that the music-hall Madonna and final benediction came to me with something of a shock.

In this sort of imitation, if the old feeling as well as the old form cannot be revived or suggested, one is conscious only of the imitation. The old Morality, "Everyman," is as entirely out of harmony with the religious and dramatic ideals of to-day, but even on the modern stage one could not mistake the earnestness and complete sincerity of the author, and the result was impressive. But in "Bethlehem" it was impossible for me to lose sight of Mr. Housman and Mr. Craig—impossible not to hear the creaking of the machinery, not to see the dangling of the wires. It was as artificial, and therefore as tedious, as the sham primitive pictures and woodcuts, the sham mediæval furniture and decoration, that the followers of William Morris have made the debased fashion, with a note of irreverence added. After all, the real Miracle Play meant more to the people for whom it was written than an amusing or even serious drama. N. N.

GERHART HAUPTMANN'S "VITA NUOVA."

CAMBRIDGE, December 29, 1902.

The friends of Gerhart Hauptmann have had a rather arduous task during the last few years in trying to reconcile their admiration of his genius with the erratic and often far from agreeable paths which he latterly chose to follow. With every new production of his, it appeared less likely that he would succeed in attaining the high ideals of art held out in his "Versunkene Glocke"; and more and more the fear seemed justified that his creative power would finally succumb under the laborious effort to copy the whimsical appearances and outward paraphernalia rather than the essence of life. These doubts and misgivings have now happily been silenced; for at last the poet has given us a work of art which appeals to the eternally human, which touches the deepest chords of the heart, and which seems destined to live—the dramatic poem, "Der Arme Heinrich."

The legend of "Poor Henry," as everybody knows, was first treated by Hartman von Aue in an epic poem which is among the few real masterpieces of mediæval literature. Hartman tells us of a rich and powerful lord, Heinrich von Aue, who, like Job, in the midst of worldly affluence and splendor, is visited by a terrible affliction, being infected with leprosy; who, unlike Job, abandons himself—for a time at least—to grief and hatred and rebelliousness against God; but is finally healed, both bodily and mentally, through the pure faith and self-surrender of a simple peasant girl. The various stages of this inner conflict and its reconciliation Hartman brings before us with a charming simplicity and artistic grace. We see the unfortunate man despairing of all help because he has been told that he can be saved only by the blood of a pure maiden who, of her own free will, shall die for him. We see him retiring from the world, and seeking refuge in the lonely farmhouse of one of his tenants. We see him here attended and cared for by the farmer's little daughter, who, although a mere child, seems to divine the sick man's thoughts and wishes, and is so inseparable from him that he playfully calls her "my little wife." We see the child lying awake at night—for she has heard of the fatal condition of his recovery—weeping and grieving for the poor sufferer, until she suddenly is overjoyed and transfigured by the thought that it is *her* mission to save him. And we see this salvation finally brought about through a change of heart in Heinrich himself. Through his unwillingness to accept her sacrificial offering, through his decision to submit henceforth trustfully to the mysterious ways of God—in other words, through his inner transformation and renewal—his bodily recovery also is achieved. It is a poem, naïve, childlike, and mediæval in its tone, surrounded by an atmosphere of the miraculous and the wonderful; at the same time, however, breathing a spirit of unconditional trust in the power of goodness and in the promptings

of the inner voice, and in so far essentially modern.

Among the poets of our own time, Longfellow, if I am not mistaken, is the only one who has attempted, previous to Hauptmann, to revive this mediæval tale. But the sweet and graceful singer of "Hiawatha" was not at his best when he turned to this subject, and it can hardly be said that his "Golden Legend" reproduces anything but the outward show of mediæval life. Of religious machinery and spectacular by-play there is plenty: Lucifer and his host, angelic chants, itinerant preachers, Minnesingers, revelling friars, devout pilgrims, pretty bits of romantic landscape after the manner of Tieck, even a whole Nativity Play, introducing the Wise Men of the East, the Angels of the Seven Planets, allegories of Virtues, Mary, Jesus, and God the Father himself. But there is no life in all these picturesque scenes and happenings, and the principal figures, Prince Henry and Elsie, are no human characters, and entirely fail to appeal to our deeper emotions. It is just here that the supreme merit of Hauptmann's drama lies. Hauptmann has gone to the root of the subject. He has stripped the mediæval tale of what is merely superficial and temporary; he has made it a poetic vessel of universal human suffering and sympathy; he has made it a perfect symbol of inner regeneration; and thus he has produced a work of art which will stand by the side of Goethe's "Iphigenie," and tell future generations of the heartburnings, the bitter struggles, and the exultant joys of a man who, perhaps more ardently than any living poet, is striving to express what moves, inspires, and presses upon our age.

It would be a futile task to relate in detail by what means Hauptmann has accomplished this feat; for the play is so much a drama of the inner life that it is well-nigh impossible to reproduce its movement by paraphrasing it—as impossible as it is to describe a symphony. A few remarks, however, about the leading motive of the whole may be helpful to the understanding.

Heinrich himself is conceived by Hauptmann as a strong, heroic nature, overflowing with life, burning for action. In years gone by, when a mere youth, he would often be a-hunting in the Black Forest, and then he would spend many a day on the farm of his old tenant Gottfried, whom he loved like a father, and with whose little daughter Ottegebe, then hardly out of her leading-strings, he would play and sport, taking her with him on his horse and caressing her as "his little wife." Since then nine years have passed. In these years he has seen and experienced much. He has taken part in the conflict between Pope Innocent and Emperor Frederick II.; has, for his allegiance to the Emperor, been inflicted with the Papal ban; has, under this ban, undertaken a crusade; and, at the Emperor's court in Palermo, as well as in the land of the Saracens, he has led a life of worldly joy, has revelled in the voluptuous beauty of the Orient and imbibed the teachings of the Koran. Now he returns to the scenes of his youth—the same and yet another. He is still impulsive; he still harbors strong desires and aspirations; but his hope of fulfilment is gone; he carries the worm within him; he has been marked by God; he is unclean, a leper. Thus far, he imagines, he has guarded the terrible secret—perhaps he hopes to guard it forever; for the present, he craves nothing but solitude, peace; and for this he has turned to the house of his old tenant. That, in reality, his disease has already been whispered about, at least among the common folk, becomes clear in the very first scene of the drama, when one of Heinrich's servants, terrorized by superstitious imaginings, takes precipitous flight.

While Heinrich for the time seems to have forgotten the little playmate of his youth, Ottegebe, who now is on the threshold of womanhood, has preserved his memory well. She is a sensitive, shy, visionary being. With the peasant lads and lasses she mingles little; her favorite stay is with Father Benedict in his forest hermitage, and what effect the child produces upon the old monk is seen from his words:

"Kommt sie, wird meine dumpfe Klause helle,
Mein enges Waldkapellchen weit und gross,
Der Heiland atmet und Maria lacht,
Und ich, von meiner Sünden Ueberlast
Sonst fast erdrückt, kann mich vom Boden heben
Und Gott, entsühnt, ins gütige Antlitz sehn."

Through the friar, she has been filled with mystic forebodings of the approaching Judgment Day; she revels in depicting to herself the sinfulness of the world; the Black Death and the scourge of leprosy are, to her, visible signs of God's wrath, and every leper's body a mirrored image of poisoned Christendom. But she also revels in the Christian mystery of atonement, in the saving power of innocent blood voluntarily shed, and in its cleansing effect upon sin and disease. What wonder that when she comes to know what frightful secret has brought Heinrich to her father's house, she should be possessed by the idea of redeeming him by her own death?

These, then, are the two characters between whom there arises a tragic conflict—a conflict of compassion and despair; of woman's desire for self-sacrifice and man's determination to struggle alone—until finally love, unconditional, all-embracing, divine love, subdues both man and woman, and dissolves the conflict into joyful harmony. That Ottegebe from the very first feels something more than compassion for Heinrich—that, unknown to herself, she loves him—we divine from the outset. Why else should she tremble whenever he speaks to her? Why should she tear the ribbon, which she had put on in his honor, from her hair as soon as attention is drawn to it? But as yet her love is slumbering; it is overshadowed by the Christian desire to atone, to rescue, and by the Christian longing for the crown of spiritual reward. Heinrich, on his part, has no other feeling for her except that of curious wonder at her devoted service; he is too much absorbed with himself and his frightful fate to have thoughts of anything else. It is wonderful to see how it is just this frightful fate of his, the gradual unfolding of his terrible doom, which draws this man and this woman together, which opens their hearts to each other, and thus brings salvation and life to both.

The climax of the drama is reached in the third and fourth acts, when Heinrich, after having made known the nature of his disease, has fled to the woods and is hiding there like a hunted beast, pursued by the execrations and curses of the populace. He now seems to have risen to colossal proportions. Misery has stripped him of everything that is weak and small. He has now penetrated to the bottom of things; he has become knowing; he has found out that life is a dungeon, that death is freedom; he scorns as folly the report, brought to him by old Gottfried, that his daughter is determined to die for him at the hands of the physician of Salerno; he chases herself away with cursing and stones when she ventures into his wilderness; and in grim frenzy he diverts himself by digging his own grave. These moments, however, are followed by others in which the mere craving for existence gets the better of him. In such moments he will prowl about, like a beast of prey, in the vicinity of Gottfried's house, or wherever he imagines Ottegebe to be, crouch on the ground, creep through the thicket, only to get a glimpse of her and to feed on the thought of being saved by her. And at last, in one such moment of highest transport of despair, when exhausted and fainting he has sunk to the ground, Ottegebe is at his side, and in rapturous delight presses a fervent kiss upon his forehead.

Inexpressibly sweet is the contrast formed by the last act with these wild and frenzied happenings. Heinrich has returned with Ottegebe to his castle. Instinctively, even against his will, had he followed her to Salerno. Travelling by the side of his little saint, he had for the first time felt his heart secure from the pursuit of the demons; a new life had been born within him, joy and hope had returned; and at last, at the height of the catastrophe, when the sacrificial act was about to be performed, Love had descended upon him and bidden him prevent the execution—and he was healed!

"Da traf der dritte Strahl der Gnade mich:
Das Wunder war vollbracht, ich war genesen!
Hartmann, gleichwie ein Körper ohne Herz,
Ein Golem, eines Zauberer's Gebilde,
Doch keines Gottes—thönern oder auch
Aus Stein, oder aus Erz—bist du, solange nicht
Der reine, grade, ungebrochne Strom
Der Gottheit eine Bahn sich hat gebrochen
In die geheimnisvolle Kapsel, die
Das echte Schöpfungs-Wunder uns verschliesst:
Dann erst durchdringt dich Leben. Schrankenlos
Dehnt sich das Himmlische aus deiner Brust,
Mit Glanz durchschlagend deines Kerkers Wände,
Erlösend und auflösend—dich! die Welt!
In das urewige Liebes-Element."

While Heinrich from this moment on is in the full possession of his powers, joyful, daring, active as of old, Ottegebe has remained as in a stupor. She has not fulfilled her mission, she has not won the heavenly crown! She, too, has through suffering become knowing. She knows now that she loves Heinrich, but it seems to her an unholy love, an earthly desire. She, the bride of Heaven, has fallen a victim to the powers of darkness. What is there left to her but death? So, as in Goethe's "Iphigenie," there seems to arise a new conflict after the rounding out of the main theme. But, happily, this conflict is only a transient clouding of the radiance that is spread over these closing scenes. For human love proves its divineness, in spite of these ecclesiastical scruples; and when Heinrich, at the wedding ceremony, presses Ottegebe passionately to his breast, she whispers joyfully:

"Heinrich!—Nun sterb' ich doch den süssen Tod!"

There are few works in the world's literature that aim higher than this sweet and noble poem. In depth of feeling, in simplicity of structure, in beauty of language, in strength of character drawing, in

spiritual import, it surpasses to my mind everything that has come from the hand of living dramatists. Hail to the poet who, disdaining ephemeral effects or the applause of the crowd, has clung to that which is for the few of all ages, and has thus added a new treasure to the spiritual possessions of mankind.

KUNO FRANCKE.

Correspondence.

GALLATIN ON BANKING AND CURRENCY.

TO THE EDITOR OF THE NATION:

SIR: The following letter from Albert Gallatin to Nathaniel Macon of North Carolina on the all-important subject of finance may be of interest to many readers of the *Nation*. Macon was one of the more influential Southern politicians of the Jefferson type; he was an inveterate opponent of paper currency in all forms, and consequently an enemy of banks of issue, both State and national. He was a lifelong friend of Gallatin; in 1808 he had openly preferred him for the Presidency in place of Madison.

This letter, here published for the first time, is taken from a small collection of papers now in the possession of Mrs. Walter K. Martin of Richmond, Virginia—a collection hitherto unknown to students. It explains itself, and casts some light on the earlier phase of the great Bank quarrel. Macon's letter eliciting it has not been discovered, but its contents may be guessed from what we know of the character of its author and from what Gallatin says in reply.

Very truly yours, WM. E. DODD.

RANDOLPH-MACON COLLEGE, VA.,
January 3, 1903.

NEW YORK, 3d Decr. 1830.

DEAR SIR: I duly received your letter of the 19 June last and was a little startled by the request to aid you in your intended attack on the Bank of the United States, as I thought you could not have been unacquainted with the fact, that I had openly and officially advocated the renewal of the charter of the former bank, and that, although there were many opponents on constitutional grounds, the question would not have then been lost had it not been for the hostility of a portion of the Republican party either to Mr. Madison or to myself. Mr. Crawford was our principal support in defence of the renewal; and without entering into details, it is known to all that the Clinton party was extremely dissatisfied with the preference given to Mr. Madison to the exclusion of Gov. Clinton, and that De Witt was in 1812 the candidate of the opposition. This has nothing to do with the present question, but may explain why the tenor of your letter surprised me. But it was not the cause of the delay in answering your queries; and, although I was not ready to do it before this time, I ought to have acknowledged the receipt of your letter and pray you to excuse the omission.

I had been engaged in researches respecting the metallic currency of the United States, which led to a conviction that the circulation of gold coins ought not to be prevented as it now is by our mint regulations, and that they ought to be rated according to their real market value as compared with silver. I could hardly avoid in the discussion some allusion to our paper currency, but had properly investigated a subject of which I had lost sight since 1816, when I went to France. I received simultaneously your letter and one from Mr. Walsh requesting that I would prepare an article for his Review, in relation to the Reports of the Committee of the last session of Congress. It was impossible to answer you without writing a book, and having some leisure and no sufficient conception of the labor the scattered materials would require in order to an analysis and condensed form, I unwittingly promised to furnish the article. It has cost me three months of tedious labour, and, as it would not have been written but for your letter, I must ask your permission to inflict on you the task of reading it, and have accordingly written the Editor to send you a copy. I had not time to revise all the calculations myself; and the person I employed made several mistakes. Although there is none that can affect the argument, I have always felt conscientious with respect to facts and particularly statements of numbers which readers have no means to verify, and I am now employed in revising and correcting those myself with a view to publication in pamphlet form, which I will transmit to you when published.

You are quite right in believing that I would feel very averse to any interference or connection with the party politics of the day; and you will easily perceive from the general tenor of my reply, that I am no friend either to *our* Banking system generally or to a paper currency of any kind. Had I my choice, I would prefer a pure metallic currency and private Banking houses, as in London and on the continent of Europe, who might with perfect freedom receive money on deposit, discount notes and deal in exchange, but not issue bank notes or in any respect interfere with the currency; and I would wish that government should neither restrain them in other respects nor grant them any privilege whatever. But I am equally averse to any issue of paper money by government, and still more so to its converting the Treasury into a Banking, trading company. This I think the very worst plan, in every view of the subject, that could possibly be devised, and the remedy worse than any evils, great as they are, that may flow, not only from the existing system, but from letting again the State Banks run wild and suspend their payments. I have viewed the subject with a single eye to a sound currency, which to provide for appears to me a constitutional and a moral duty. Independent of every temporary party consideration, there are questions of right and wrong, of what is just or unjust, which must be settled on that principle alone. Such is the question of currency. With a debased coinage or a fluctuating, depreciated paper, you subvert every private and public engagement, impair the performance of every contract, make invariably the ignorant and the weak dupes of the shrewd and wary, and demoralize the whole community. What are the means to prevent this under existing circumstances? Can Congress subvert the whole of the deep-rooted Banking system, sustained, as it is, by almost every State in the Union, and revert at this day to a metallic currency? I have no doubt of the constitutional power in that respect and have suggested the means; but I feel equally certain that the power will not be exercised. And in that case I will congratulate you and the country if you can discover any safe means of attaining the object, otherwise than through a bank of the U. S. organized on principles in substance similar to those of the existing institution. Certain it is that none has as yet been suggested, and perceiving no other myself, my conclusions are in favor of the renewal of the Charter. For my arguments in support of the constitutionality of the measure I must refer you to the article in the Review. With me they are conclusive, and I have no doubt on the subject; but of that all are competent to judge, and, provided I shall have succeeded in bringing the *facts* fairly and correctly before the public, I will be satisfied that it has been a useful task. It may be allowed to add that I am no otherwise connected in the Bank of the U. S. than as owner of ten shares, and that from it or from any other Bank I have never asked or received any favor whatever, not having ever had a single note discounted in the whole course of my life.

I am, Sir, very respectfully your obedt. Servant. ALBERT GALLATIN.

NATHANIEL MACON, Esq.

LYNCH LAW AND SOUTH CAROLINA.

TO THE EDITOR OF THE NATION:

SIR: In your issue No. 1953 (December 4, 1902) appears an article by Mr. Albert Matthews on the subject of "Lynch Law," in which he states that it has been asserted that lynch law derived its name from Lynch's Creek, S. C., because at that place the practice of lynching began. This derivation of the term, Mr. Matthews admits, has yet to be proved, but he gives extracts from Boston papers of 1768 giving accounts of a lynching by Regulators that occurred on Lynch's Creek, which show, he says, that there were at that period instances of lynch law "in its original meaning of whipping," and that Regulators held a meeting at Lynch's Creek. Obviously, says Mr. Matthews, we have here the thing itself, though not our now familiar term.

We cannot concur with Mr. Matthews in his apparent inclination to find in the action of the Regulators on Lynch's Creek the origin of the term lynch law. This inclination on his part appears to be based on two assumptions, both of which are erroneous, viz., (1) that lynch law, in its original meaning, meant whipping, and (2) that the Regulators began their course at Lynch's Creek.

The original meaning of the term lynch law was not confined to whipping. The instances Mr. Matthews himself presents show that other punishments, such as tarring and feathering, and banishments, were adjudged and administered as well as whipping; and indeed, as we shall see, the Regulators began their course by the infliction of the death penalty. The accepted definition of the term is the infliction of punishment without a legal trial, as by a mob or by any unauthorized persons.

The Regulators in the Carolinas did not begin their course on Lynch's Creek, S. C. The organization which in 1768 became known as "Regulation," began in Granville, Anson, and Orange Counties, in North Carolina, as early as 1766, and was instituted in South Carolina, as Judge O'Neall, in his 'Annals of Newberry,' tells us, by Thomas Woodward, Joseph Kirkland, and Barnaby Pope, who resided in the region between the Catawba and Saluda Rivers, and not on the Pee Dee or Lynch's Creek. The earliest account we have of the operations of this body is in the South Carolina *Gazette* of May 26, 1767, in an extract from a letter from Pine Tree Hill (Camden), dated May 14, 1767, and is as follows:

"On the 6 inst. a number of armed men, being in search of Horse stealers, robbers, etc., discovered a parcel of them in camp on Broad River [Broad River was between the Catawba and the Saluda], where an engagement soon ensued, and the thieves were put to flight; and though none of them were taken, it is reasonable to suppose, from the quantity of blood on the ground, that some of them were killed. They left behind ten horses, thirteen saddles, some guns," etc.

The next notice is in the *Gazette* for the week of July 27 to August 3 of the same year, to wit:

"The gang of villians from Virginia and North Carolina who have for some years past in small parties under particular leaders infested the back part of the Southern provinces, stealing

from one and selling them in the next, notwithstanding the late public examples made of several of them, we hear are more formidable than ever as to numbers, and more audacious and cruel in their thefts and outrages. 'Tis reported that they consist of more than 200, form a chain of communication with each other and have places of general meeting; when (in immitation of councils of war) they form plans of operation and defence and (alluding to their secresy and fidelity to each other) call their places Free Mason Lodges. Instances of their cruelty to the people in the back settlements where they rob or otherwise abuse, are so numerous and shocking that a naration of them would fill a whole *Gazette*, and every reader with horror. They at present range in the Forks between Broad, Saluda, and Savannah Rivers. Two of the gang were hanged last week at Savannah, viz., Lundy Hart and Obadiah Greenage. Two others, James Ferguson and Jesse Hambersham, were killed when these men were taken."

Until 1768 the settlers who organized in defence of their property, their homes, and their lives against this banditti were designated, says Gregg in his 'History of the Old Cheraws,' by the appellation of the "Mob," and seem to have adopted it themselves; but on the 4th of April, 1768, they changed it to that of "Regulators." Until this time the "Regulation," as then called, had been endeavoring themselves to break up the band of outlaws which infested the back country, but now they took the wiser course of demanding from the Royal Government on the coast protection and the establishment of courts in the interior; and the organization, which had at first for its object the administration of justice and the infliction of punishment for the suppression of outlaws, now began to assume a political and revolutionary character as well. It was this occasion which gave rise to the proceedings at Lynch's Creek, accounts of which Mr. Matthews has found in the Boston papers. On the 25th of July, 1768, the South Carolina *Gazette* gives the account of the same.

"The last accounts from the back settlements say that the people called Regulators were to have a meeting at Lynch's Creek on last Friday, when it was expected 1200 would be assembled. The occasion of this meeting is said to be a party of them lately being roughly used by a gang of Banditti consisting of Mulattoes, Free negroes, &c., Harbourers of runaway slaves, at a place called Thompson's Creek, whom they ordered to remove. It is added they anxiously wait to hear the fate of the act for establishing Circuit Courts in this province sent home for the Royal approbation, which, if it obtains, will restore good order in those parts."

To recapitulate: Regulation did not begin at Lynch's Creek, S. C., but began in North Carolina, two years before the meeting at that place, and had spread throughout the farther back parts of the province from the Catawba to the Savannah before it reached the Pee Dee, nearer the coast; and upon reaching the Pee Dee section assumed in South Carolina a political phase, thus returning to its original purpose, as Professor Bassett of Trinity College, North Carolina, in a paper published in the Annual Report of the American Historical Association of 1894, has shown was that of the organization in that State. What, moreover, is decisive of the point is the fact that, before the organization reached the Pee Dee section, to wit, Lynch's Creek, it had assumed a name—the name of "Regulation," and not the name of "Lynch Law"—and was known by that name or by the name of "Schofelites," from the name of a leader, and not by the name of "Lynch Law." If the conduct of the Regulators in South Carolina was to give the name to the practice of illegal punishment, it would have been called, not Lynch Law, but "Broad River Justice," or "Savannah Law." It is not until 1841, as appears by Mr. Matthews's collection, that the two terms are found together, and then they are used in regard to affairs in Texas and Arkansas. I feel quite sure that nothing to connect the term "Lynch Law" with that of "Regulation" or "Regulators" in Carolina will ever be found.

The Lynch family in South Carolina, from whose possessions in that part of the province the name of Lynch's Creek was doubtless derived, bore a conspicuous part in the Revolution—two members of it, father and son, taking part in the Declaration of Independence; for though that celebrated instrument (now, however, somewhat at a discount) is signed by but one of them, to wit, by Thomas Lynch, jr., the father, Thomas Lynch, sr., was also a delegate to the Congress from South Carolina and present in Philadelphia at the time, and would have signed it had he been able to attend the Congress. Thomas Lynch, jr., had been sent as an additional delegate because of his father's illness, and thus became a signer, but with his father's concurrence. Is it not rather hard, then, that at this late time, more than a century after their deaths, the suggestion should be made to associate the name of these men (whose philanthropy, too, was as great as their patriotism) with a lawless and cruel practice which both of them would utterly have condemned, rather than with the struggle for liberty in the inauguration of which they took so prominent a part?

EDWARD McCRADY.

CHARLESTON, S. C., January 6, 1903.

Notes.

A "National Edition" of the Works of Daniel Webster in eighteen volumes is announced by Little, Brown & Co., Boston. It will be bound in crushed Levant morocco, and accompanied by a special set of India proofs of the portraits and views.

R. H. Russell has made a pretty quarto of 'The History of Over Sea, Done into [so-called] English by William Morris,' with some Morris affectations in the print, and two pen drawings and other decorations by Louis Rhead, in harmony with the typography though the frontispiece does not truly represent the text in the costume of the lady.

'Who's Who' for 1903 comes to us promptly from Macmillan, still swelling against its bounds, which causes some standing tables to be omitted, for separate republication, maybe. This register has acquired an institutional value among books of reference, and can ill be spared by any one. In the American entries, some discrimination is noticed among our millionaires, the families of Gould and Vanderbilt being unrepresented. All the great political bosses, we believe, except Croker, are likewise in the vocative. Neither Platt nor Quay nor Addicks is "anybody." President Roosevelt is in plain view, but where is his fellow-sovereign John Mitchell? We observe that Mr. Griggs is still described as Attorney-General, for the same reason that his successor Mr. Knox goes unrecognized.

Millionaires pay the penalty of caricature along with other consequences of their prominence, and the 'Millionaires of America' have been thus treated by two artists of foreign name, Max Cramer de Pourtalès and C. de Fornaro (New York: Medusa Publishing Co.). The portfolio of twelve tinted portraits betrays shades of personal estimation. Mr. Carnegie, for instance, has nothing to complain of, in likeness or in attributes, while others who figure in this gallery seem malevolently regarded. The draughtsman's skill is uneven, and there are some flat failures at characterization.

Two librarians, Frank Pierce Hill and Varnum Lansing Collins, have collaborated in a privately printed list of (English) 'Books, Pamphlets and Newspapers Printed at Newark, N. J., 1776-1900.' If we ask why they start in with the beginning of the second century of that city's existence, they answer that not till then was a printing-press known to have been set up within its limits. This might imply an intellectual falling off in the theocratic seceders of 1666 from Connecticut and Long Island. The first imprint, indeed, antedated the first printer, thanks to a press lent from New York for several (Whig) issues of the New York *Gazette;* and 1791 is the date of John Woods's permanent appearance on the scene as the printer of the Newark *Gazette.* The list is confessedly incomplete, but it is a very laudable and useful undertaking. The arrangement is chronological, and there is a full index. The edition is limited.

Students of the military side of the American Revolution will remember that Greene, after the battle of Hobkirk's Hill, attributed his defeat to Col. Gunby, under whose orders the famous First Maryland Regiment, at a critical juncture, fell back instead of holding their ground. Mr. A. A. Gunby, in a small volume entitled 'Colonel John Gunby of the Maryland Line' (Cincinnati: R. Clarke Co.), undertakes to clear Col. Gunby of the charge of blundering—a charge sustained by the court of inquiry after the battle. As the author's method is comparison of secondary accounts rather than study of first-hand authorities, his results are not conclusive; but his examination, so far as it goes, confirms the judgment already formed by others, that the trouble began with the death of Capt. Beatty, and that the confusion of the Marylanders was as much the result of panic as of Col. Gunby s order. The other incidents of this unfortunate officer's life seem not to have been of much general importance.

Cyrus C. Adams's 'Textbook of Commercial Geography' (Appleton) is one of the most eminently satisfactory textbooks of the year just elapsed, and meets a distinctly recognized need. The only available English work in the field had been that of Chisholm, and this is a handbook rather than a textbook, and hardly practicable, because of size, cost and construction, for regular classroom use. It is likewise thirteen years old—an unpardonable, if inevitable, blemish in a work on this subject. The new treatise is, first of all, thoroughly

up to date; it is of convenient size and of small cost; and it is constructed upon a system which one would like to call psychologic. "Each product is treated," says the author in his introduction, "in the chapter relating to the commerce of that country in which the production or manufacture of the commodity is specially prominent. This plan is regarded as preferable to grouping products under the heads of animal, vegetable, and mineral commodities, which would involve some weeks of rather tedious labor, of an encyclopædic nature, on the part of the student." In other words, information is presented in categories which possess the maximum mnemonic value without sacrificing system. Doubtless for the broad view of the scientific treatise this would be a mistake, but for the purpose of this book it is admirable, as is the resolute omission of unessential detail. The point of view is plainly American; 130 pages are devoted to the United States, its external possessions, and Cuba. In comparison, the United Kingdom receives nineteen pages, Germany fourteen, etc. Of course the volume and diversification of our industries explain this in part. The general view of commerce that emerges is, however, a comprehensive one. An enormous number of facts and figures is introduced, and the essential points are seldom missed. Not only are the statistics and character of a nation's commerce exhibited, but some idea is likewise given of the conditions of government, commercial security, etc., as well as a most convenient list of English equivalents for foreign weights, measures, and money. The numerous maps are of excellent quality, but necessarily small, to conform to the size of the pages. An English trade-atlas such as Scobel's is the next desideratum for classroom study, if the lantern-slide system is not available. The index is what it should be.

'Mammalia,' by Frank Evers Beddard, M.A., F.R.S., is the tenth volume of the Cambridge Natural History (Macmillan). Works like this are built upon predecessors of similar import and inclusiveness. Consequently, it is expected that the later published will copy the excellences and avoid the defects of the earlier, at the same time adding the more recent discoveries and other advances in the science. Dr. Beddard's volume is not at all disappointing. It is closely brought up to date, contains the results of the most modern researches in respect to genera and species and in anatomy and habits, and either has turned the criticisms of forerunners to good account, or has been so carefully wrought out as to eliminate their blemishes to a most gratifying extent. In various respects the work is a model: its illustrations are good and abundant, its explanations, descriptions, and comparisons are clear and sufficiently concise; and, as all forms could not be treated in a work of its size, its selections are made with excellent judgment. The extinct forms are arranged by their affinities among the living; together, they outline the history of the changes effected by time, of the conditions in the more or less distant past, and of the phenomena that have been unearthed in the career of the mammalia from the earliest to the still living. The work will attract the geologist and anatomist as well as the student of existing species. Palæontology, comparative anatomy, and the more limited fields of distribution and habits are all brought under consideration. Naturally, there are topics which appear too much restricted. Lack of space is the excuse offered; yet, while it must be accepted as valid, one cannot refrain from wishing there was more in cases like that of the egg-laying of Echidna or Ornithorhynchus, or the flight and feeding of Galeopithecus.

The plan of Dr. Harris Hawthorne Wilder's 'A Synopsis of Animal Classification' (Henry Holt & Co.) will be appreciated by all who have to deal with zoölogical classification. The book expresses Dr. Wilder's opinions in regard to a proper characterization and arrangement of the animals. It is to be considered a temporary arrangement or a summary of the author's present knowledge. A considerable amount of labor has been expended upon it, a great deal of it on classifications by others rather than on studies of the animals classified. Original matter is more apparent in the diagnoses, and the latter will probably have most weight in determining the value of the whole. Passing the superstructure for the underpinning, it needs but a glance among the definitions and descriptions to bring to light errors, where they should be least expected, in matter pertaining to the best-known groups. Evidently it was the intention to include the chimæras in the Selachii, but the diagnosis "5—7 separate gill openings" excludes them. All the Myxinidæ and all but one or two other species of the Marsipobranchs are excluded from the division to which they belong by assigning it "6—7 pairs of circular gill openings." "Scales cycloid or ctenoid" are used to characterize the Teleostei, but this excludes such teleosts as have no scales, and many others the scales of which are neither cycloid nor ctenoid. The Ophidia are characterized in part by "A single lung developed (right)"; this is particularly inaccurate, since many of the snakes have two well-developed lungs, and in many others the right lung is rudimentary or absent. The volume is in need of a thorough revision. A glossary giving the etymology of all the names used would be a most desirable addition to a work of such purpose as this one; it would explain so much, and aid so much in memorizing.

Kathlamet Texts, told by Charles Cultee, recorded and translated by Franz Boas, is the title of Bulletin 26 of the Bureau of Ethnology. The Kathlamet is an Indian dialect of the Columbia River region; and since Professor Boas has found it spoken by three persons only, his record probably saves to linguistic science this peculiar form of Chinook speech. Unfortunately, scientists are not always thus timely; the opportuneness of the present work emphasizes anew the need of haste in the collection of the ephemeral data bearing on Indian life. These myths and tales are predominantly about animals; they are given in a connected English narrative, which is accompanied lower on the page by the actual (phonetic) text, and a literal interlinear translation. Keys to pronunciation are afforded, and abstracts of the myths and tales close a notable and scholarly work. It is true, of course, that the phonetic system, expressed, for example, in such characters as "X!" is of little value as an aid to pronunciation to any one but the author; anthropological science waits eagerly for the perfection of the phonogram.

For twenty years the Danish historian C. T. Sörensen has made a special study of Bernadotte, the results of which have appeared in valuable monographs on various points. Notice now comes through the *Berlingske Tidende* of Copenhagen of the publication of the first part of an extended biography entitled 'Bernadotte in the North, or the Separation of Norway from Denmark, and its Union with Sweden.' It is probably not generally known that the Danish archives contain richer material for the study of Bernadotte during the period preceding 1814 than even the Swedish collections. The reason for this apparent anomaly is the suspicion entertained of Bernadotte by the Danish Crown Prince Frederick, and the consequent voluminous reports of the former's movements made by spies and others to the Danish Government. The present author has made full use of this too long neglected material, which, it is believed, will correct many erroneous impressions received from the less objective Swedish authorities of earlier investigators. Sörensen has also had access to the Dépôt de la Guerre in Paris. None of Napoleon's other marshals can compare in interest and complexity of character with the founder of the present royal house of Sweden and Norway, and a new and serious presentation of him must be welcomed by the student of history.

The *National Geographic Magazine* for January opens with an account of the origin, present organization, and work of the United States Coast and Geodetic Survey by its Superintendent, O. H. Tittmann. In the seventy years of its active existence it has mapped 30,000 miles of topography, "sounded out minutely nearly 300,000 square miles of water, while its deep-sea soundings cover a little less than a million square miles," the results of the whole work being shown on about 500 charts. Two of the force, who have been engaged in a reconnaissance survey in Alaska, report plans for the ascent of Mt. McKinley, which in their opinion would require a carefully organized expedition with a year's supplies. An article on jade, by S. E. Easter, gives many interesting facts in respect to this stone, which the Chinese regard "as the most beautiful substance in which human thought can embody itself." Confucius says that "it symbolizes virtue, and the price at which all the world values it symbolizes truth."

Adalbert Roquette, head librarian of the University of Goettingen, has just published an interesting brochure based on official reports, and entitled 'Die Finanzlage der Deutschen Bibliotheken,' in which he offers data on the poor financial backing which the German libraries must contend with. In general the condition of affairs is worse in this regard than it was in 1870. Only the Royal Library in Berlin proves an exception, as its annual donation has been increased from 90,000 to 150,000 marks. On an average, the German libraries fail to meet one out of every six requests for books because they do not possess them and have not the money to buy them. Roquette finds, however, that one of the chief causes for this inability is the phenomenal increase

in the literary output of Germany. In 1870, the sum of 37,000 marks would have sufficed to buy a copy of every book published in the country; in 1880 the sum needed was 65,000, and now it is 105,000 marks. Moreover, the average price of German books has materially increased during this period. Some of the larger libraries can buy only 5 per cent. of German publications, and the highest, outside of the Berlin library, is about 30 per cent.

A new educational departure at Oxford is the establishment of a training college for women teachers in secondary schools for girls. Its objects are to prepare students to pass the University examinations for the teacher's diploma; to give opportunity for an extra year of University life and study; and to provide a theological course (if desired) for those who will become divinity lecturers in colleges and girls' schools, or who will have to give religious instruction in the form of the school to which they may be appointed. At the opening of Cherwell Hall, as it is styled, on October 27, the Bishop of Liverpool emphasized the fact as of national importance that in secondary education "they were lagging in the race behind their Continental rivals. If at the present moment they were called upon to supply the secondary schools and the scholars who were capable of being educated in them, they would not have a hundredth part of the number of required teachers." The fees will be £65 a year; there is a scheme of scholarships and bursaries, and also a loan fund.

An agricultural college for women who have had an intermediate education is to be opened in Russia under the direction of the Ministry of Agriculture. While the main object is to give a general training, students will also be permitted to restrict their attention to special branches of agriculture, such as dairy farming, gardening, bee culture, poultry keeping, and cattle and sheep breeding. At the end of the three years' course the students will have the right to fill various posts under the Ministry of Agriculture, and will be further entitled to hold the position of administrators of the Crown domains and of teachers in the intermediate agricultural schools. 325 young ladies have announced their intention to enter the college, which will be, it is said, the first institution of the kind in Europe.

There can be no doubt that the woman question, as far as the German universities are concerned, has entered upon a second stage, and that is reactionary. The restrictions in Berlin have cut down the attendance, which a year and a half ago amounted to over six hundred, to something like four hundred at present. Munich, Leipzig, Halle, and other universities have also made it more difficult for women to get even the permission to attend lectures. The latest to decide upon these restrictions is Würzburg, whose Rector announces that only a card from himself will open the lecture rooms to women. These restrictions are, at least professedly, directed chiefly against Russian women, especially the graduates of the girls' gymnasia of that country; but it is evident that the German university authorities are convinced that they have not been making haste slowly enough in this matter during the last half-dozen years. No other government shows the least inclination to follow the example of Baden, which, at its two territorial universities, Heidelberg and Freiburg, admits women to matriculation and examinations on equal footing with men.

The novel experiment of establishing a Russian university in Paris is evidently proving a success. The Russians, unlike most Europeans and Americans, prefer Paris to Germany as a seat of high learning, and the colony of educated Russians in the French capital is accordingly large. One year ago a movement was inaugurated to have courses of university lectures delivered in Russian and French for this colony, and fully a dozen courses have been successfully given, mostly on literary, historical, and philosophical subjects. Among the lecturers were Brandes, Reclus, Nordau, and others. For the academic year 1902-1903 a full programme has been prepared, and the enterprise has evidently come to stay. It differs from the Russian historico-philosophical seminaries that were maintained some years ago by Alexander II. in both Leipzig and Berlin. Those two institutions, where Russian students were compelled to listen to lectures by German professors, turned out the majority of the law professors who are now active in the universities of Russia. The Paris institution is entirely a private project, and nearly all the teaching is done by Russian savants, many of whom are known to be antagonistic to the state of affairs in their mother country.

The general Occidental interest in Japanese art is believed by those most competent to judge to date from its first exhibition on a large scale at Vienna in 1873. The collection then so intelligently made was by Count Sano, who died in Tokio on December 7, 1902, at the age of eighty. His history illustrates the possibilities of the modern Japanese man. A medical student, he was sent to Holland in 1862 to oversee the building of a man-of-war. He visited also the Paris Exhibition, and there and then, it seems, resolved to begin what proved to be his remarkable career of healing and educating. He was active in giving the empire a lighthouse system, and then organized the Fine Arts Society, and began the formation of museums and the improvement of public parks and gardens. In Vienna he studied the methods of the Red Cross Society, and in Japan, on the breaking out of the insurrection of Saigo in Satsuma, in 1877, organized the Humane Society which later became the Red Cross of Japan. This society has now seven hundred thousand members, and an annual income of over a million yen. Besides complete equipment on land, it possesses two hospital ships named *Saviour* and *Mercy*. With Sano, ex-Minister of Finance and counsellor to the Emperor, art was a passion and charity a fine-art. For many years he was president of the Fine Arts Society and of the Red Cross.

—It is hard to believe that the more memorable sayings of Epictetus and Marcus Aurelius, or of our own Emerson and Thoreau, stimulate only the intellect. As these sayings grew out of singularly consistent and purposeful living, it seems that they should be convertible into terms of life. One gains some confidence that they are in reading the newly published 'Matthew Arnold's Notebooks'—a little volume (Macmillan) which curiously resembles in its contents the calendars we give away at Christmas time, or the little booklets entitled (say) 'Daily Food.' Arnold was accustomed to jot down in the narrow spaces of his diary, among notes of his engagements and family happenings, passages that struck him in his reading. In this way he had every day before his eyes a thought for that day. Greek, Latin, French, Italian, German, English extracts, all lie harmoniously together, preserving a certain unity. What is remarkable, however, is not the diversity of his reading, but the character of the passages he chose. He was, perhaps, the wittiest writer in England, but none of these maxims are chosen for their wit; he was the apostle of the "grand style," but his notebooks contain few extracts notable for stylistic elegance. His diaries resemble in no respect the commonplace books of a littérateur; they are more like the enchiridion of a devotee, or the "golden texts" of a Sunday-school lesson book. Nothing could more clearly bring out the essentially serious nature of the man than this attempt to discipline his spirit through daily contact with some high thought. There can be no question that he endeavored to find the maxims appropriate to his case and to live by them.

—Certain maxims are repeated many times in the year, and year by year. Thus, in the years from 1857 on, the resolve, "Let your aim be always definite" (*Semper aliquid certi proponendum est*), was a standing order. It represents very well the critic's constant struggle against loose thinking and random living. In his later years, when his own temperament and the pressure of society made the pleasures of the table a temptation, Franklin's "Eat and drink such an exact quantity as suits the constitution of thy body, in reference to the services of thy mind" reappears with suggestive frequency. In another way these notebooks show the complete consistency of Arnold's public and private life. Was it not he who told us to have always in our minds "lines and expressions of the great masters, and to apply them as a touchstone to other poetry"? These thoughts from the great moralists which he set down day by day were evidently touchstones to be applied to his private conduct.

—The Bell-Macmillan "Miniature Series of Painters" is now issued in another form, with limp leather covers and a photogravure frontispiece, as well as in the cheaper, cloth-covered, edition. Two numbers have been sent to us—the 'Burne-Jones,' which we reviewed on its first appearance, and 'Correggio,' by Leader Scott. This, which follows in its arrangement the type of all the other volumes of the series, is a dry little book, and has not, unfortunately, that virtue of accuracy which one expects as an accompaniment of dryness. On page 36 Correggio's "Leda" is said to be "now in Madrid," though it is correctly given in the list of "Chief Works" as at Berlin. On page 37 there is a description of the "Danaë," which says, "The body of Danaë is in the shade"; "a hind drinks in a stream behind her"; and "two beautiful little Loves are sharpening their arrows at the foot of the couch." In fact, the body of Danaë is not in shadow, but that of Cupid, described as "in a full light," is: the scene is in an interior, and, if there is any such incident as that of the drinking hind in the bit of landscape seen through the

window behind Cupid, it is too small to show in any ordinary reproduction, while the infant Loves are at the *head* of the couch. On page 55 it is said that the lunettes of the Abbess's room in the Convent of San Paolo "contain classic figures in monochrome, gray, on a gray ground, giving the effect of bas-reliefs in a sort light." On the contrary, these lunettes simulate statuettes and groups in the round, standing before semi-circular niches on which their cast shadows are clearly defined. The account of the "Marriage of St. Catherine," in the Louvre, says that "the figures are half life-size," though, in reality, they are rather over life-size but half-length, and the whole account of the three "Marriages" of St. Catherine is confused in the extreme, and leaves one wondering which one is reproduced. The List of Illustrations gives it, probably correctly, as the Naples version; the text, after the description of the Louvre version, goes on: "The painting at Naples is very much smaller, and there is no St. Sebastian in the design. Either the figure never was there, which proves that it is not a copy of the Louvre one, or it has been painted out, which does not appear likely. In the picture which forms our illustration, the attitudes, expressions, and draperies are quite different from the other." This last statement is certainly true, but if this picture is the Naples version, what does the former sentence mean? Many of these errors are trivial enough in themselves. A more serious one is the antedating by fifteen years of the "Madonna della Scodella"; an error which makes any rational theory of Correggio's development impossible. On the whole Leader Scott seems, like some other writers on art, to be constitutionally unable to describe anything correctly or state anything accurately and clearly, and we should advise no one to accept anything on her authority.

—The methods of private publishing societies, though they have undoubted value in reproducing old books, find limitations to their worth when it comes to printing new books about old ones. Here, for instance, is the Rowfant Club of Cleveland, which has just reprinted the old *Dial*, the landmark of the ever-interesting Transcendental period—a book whose original issue has grown rare and very costly. So far, so good; but the Club has also printed two volumes of "Historical and Biographical Introduction," the unique and almost exhaustive bibliographical work of Mr. George Willis Cooke, the one man who has wholly mastered the history of that early enterprise. His book unfolds the development and authorship of the whole *Dial*, identifying the writers of articles in almost every instance, and giving a chapter of biographical and literary sketching to each. Here we may not only read of Emerson, Parker, and Margaret Fuller; but of the Brook Farm Ripleys and Curtises, of Thoreau as sub-editor and Lowell as contributor, of Charles Newcomb who wrote "Dolon," of Ellen Sturgis who contributed the lines, to be found in so many albums and books of selections, beginning,

> "I slept and dreamed that life was Beauty."
> I woke and found that life was Duty."

We are informed for the first time that James Freeman Clarke wrote the passionate verses "To Nydia," and that Christopher P. Cranch, whom Poe called "one of the least intolerable of the school of Boston Transcendentalists," wrote the fine lines beginning,

> "Thought is deeper than all speech,
> Feeling deeper than all thought."

Here we see Charles A. Dana, afterwards of the New York *Tribune*, in his early chivalrous strain; and William Batchelder Greene as an abstruse thinker, not a soldier. We learn also of the criticisms and caricatures called forth by the *Dial;* and, in short, all the traits and sidelights of the one strongly marked original movement in American literature. And, finally, we learn—for here comes in the tantalizing part—that all this wealth of gossip and genius is shut up in two privately printed volumes, with the exasperating preliminary notice that only one hundred and twenty-seven copies have been printed for the Society, and no more are to be had, so that the wealthiest public library in the country cannot buy a copy in the market. From the point of view of literary history, such an enterprise is, to say the least, tantalizing.

—The eighth annual meeting of the Central Division of the Modern Language Association, held at the University of Chicago on the first three days of the new year, was (writes a correspondent) in every respect a success. This implies that the papers presented had something of interest for all, that the attendance was good, and that the social side was well looked after by the local committee and heartily enjoyed by the visiting members. The first session was held at Haskell Hall on Thursday evening, the exercises consisting of an address of welcome, delivered by Dean Judson of the Graduate School in the absence of President Harper, and the President's address by Prof. W. Starr Cutting, of the University of Chicago. In a charming manner, Dean Judson gave his impressions, from his student days, of the instruction in English and the modern languages at Williams College, concluding with a description of the immense change for the better at all our colleges and universities of the present day. Professor Cutting's address, without being in the least pessimistic, dwelt upon some of the faults of our modern-language instruction. It was in the main a plea, not for the natural method, so called, but for natural methods. The evening closed with a reception at the Quadrangle Club by the Faculty. The other social features were a luncheon on Friday, given by President Harper, a "Commers" in the evening, and a dinner at the club on Saturday for all the men who stayed until then. The papers read were about evenly divided among the three main departments. The only marked departure from earlier procedure was the holding of a set of three sectional meetings for the discussion of pedagogical questions. The success of this change was felt to be so great that it was adopted as a permanent feature. It was also decided to refer to the sectional meetings some of the more technical papers, which appeal to only a limited number of students. It was decided to hold the next meeting at Ann Arbor in conjunction with the Eastern Association, and Professor Hempl was elected president. This is the first time in its history that the Association has had the same head for its two divisions.

—The Royal Museum at Amsterdam, Holland, has just acquired, by purchase, a second one of the pictures of Marie Bashkirtseff, author of the renowned 'Journal.' It is hung on the line, among the treasures of the modern period, and will figure in the new catalogue in the spring. This may suitably draw a moment's attention to the wonderful success of the small collection of art works left behind her by this talented writer on her early death in 1884. It may fairly be said to justify her passionate aspirations for their merit and fame as expressed in the 'Journal'; and it was furthermore the expression of these aspirations that chiefly gave her her literary reputation. A first exhibition of the paintings, drawings and bits of sculpture at the Palais de l'Industrie, the year following her death, called forth very favorable mention from the press of the civilized world. Almost at once the French Government acquired three of the pictures for the Luxembourg. These were "The Meeting" (widely popularized by reproductions), and two pastel portraits, one of the model "Armandine," and the other of the Countess de Toulouse, a cousin of the artist's. Not long after, the Grand Duke Constantine carried off the graceful landscape, "April," to embellish his marble palace at St. Petersburg. The Museum of Nérac, France, secured a study of a female head; the Museum of Paris another, called "La Parisienne"; the Museum of Amsterdam the portrait of Madame Paul Bashkirtseff; and a Russian collector, at the Exposition of Munich, a portrait head, which is destined for the Museum of Moscow. Two of the pictures have come to America—"Jean et Jacques" (school urchins returning home), in the Museum of Chicago, and a study of a female figure, in the Museum of Cincinnati. The works, gradually decimated as above, used to be shown to the public at times in the former studio of the painter, kept intact in the hôtel owned by the family in the Rue de Prony, Paris. Later they have been moved to the Rue Hégésippe Moreau (No. 15), where, still under the charge of an old family servant, "Rosalie," something of a character in the 'Journal,' now grown a stout and rather imposing dame, they can be seen on Thursday afternoons.

SAINTSBURY'S HISTORY OF CRITICISM.

A History of Criticism and Literary Taste in Europe from the Earliest Texts to the Present Day. By George Saintsbury. In three volumes. Vol. II. From the Renaissance to the Decline of Eighteenth Century Orthodoxy. Dodd, Mead & Co. 8vo, pp. xviii., 593.

With the publication of Professor Saintsbury's second volume, that "History of Criticism" which Dr. Johnson projected a century ago, and which has hitherto deterred the boldest of scholars, is one step nearer completion. The general plan of the work calls for no comment here, and yet it is impossible to consider the details of the second volume without reminding the reader of the scope which the author set for himself in the first. There (vol. i., ch. i.) Professor Saintsbury, after excluding from his province "the more transcendental Aesthetic, with those ambitious theories of Beauty, and of artistic Pleasure in general, which, fascinating and noble as they

appear, have too often proved cloud-Junos," defines criticism as "the reasoned exercise of literary taste." But here at the outset there is a confusion of thought. The title of the work, 'A History of Criticism and Literary Taste,' becomes, by the author's own definition, "A History of Literary Taste and of the Reasoned Exercise of Taste"; and if we are to comprehend his purpose, it is essential that we should have some adequate conceptions of the meaning of "taste." Yet nowhere is a definition or general exposition of it attempted, for, by the nature of taste, such a discussion belongs to the very province of "theories of Beauty and of artistic Pleasure in general" which the author has at the outset excluded from his scope. In other words, Professor Saintsbury has written two volumes on a subject with which, on the very first page, he specifically refuses to "meddle."

But supposing that a definition of taste can be given without reference to the "ambitious theories" which he is to ignore, what can be meant by the "reasoned exercise" of taste? Professor Saintsbury, in an only too brief discussion of the first great critical theorist (vol. i., p. 20), regrets that Plato has not told us "what his real literary preferences in the way of poetry were," instead of putting us off with mere generalizations about beauty in the abstract. But what are the latter if not "reasoned exercises" of taste, since reasoning is an intellectual process and deals with general concepts? If criticism be merely "the most agreeable of all amusements," as our author seems to agree with Kames in thinking it (p. 469), then, and only then, can his impatience with general ideas be justified. For while taste is the intuitive process by which men apprehend the beauty of a work of art, criticism is the intellectual process by which they derive the principles for its explanation or justification.

It is with no intention of discrediting a dignified and monumental work, or of underrating the merits and difficulties of a pioneer achievement, that attention is called to what seem initial discrepancies of thought. The tradition of the higher English criticism since the days of Coleridge demands a training somewhat lacking in one whom an Italian critic has described as *per quanto valente letterato per tanto digiuno di filosofia*. A great task, without a determinate goal or an exact delimitation of its scope, is in danger of ending in confusion. That this is not the case is due to practised literary craftsmanship, and to the external aid of such devices as the characteristic "interchapters." But no extraneous device can give internal unity, and a philosophic conception of literary criticism is essential to the architectonic of such a history.

The volume before us carries on the history of criticism through the three centuries and more that separate the end of the mediæval from the beginning of the romantic period. Of the three books into which the volume is divided, the first is devoted to "Renaissance Criticism," the second to the "Crystallizing of the Neo-Classic Creed," and the third to "Eighteenth-Century Orthodoxy." After an introductory chapter on Erasmus, replete with excellent *dicta* and *aperçus*, Professor Saintsbury plunges into the stream of Italian criticism, discussing with great wealth of detail the works of theorists and historians from Politian and Savonarola to Summo and Denores. It were idle to attempt a summary of so exhaustive a treatment, but special attention may be called to the interesting discussions of Giraldi Cintio, Scaliger, Castelvetro, and Patrizzi. The 'Defence of Poetry' of Augustinus Olmucensis is a "find" upon which both Professor Saintsbury and Mr. Gregory Smith (p. 27) are to be congratulated. Yet it is to be regretted that want of acquaintance with Dr. Vossler's 'Poetische Theorien in der Italienischen Frührenaissance' has made the treatment of the earlier humanists lacking in critical detail, and that throughout this section critics like Aretino and Gelli, among the most important of the sixteenth century, are omitted because they did not write formal treatises on the subject. Castelvetro's exposition of Dante has not been lost (p. 80, n.), but was printed for the first time at Modena in 1886 under the editorship of Giovanni Franciosi. Muzio's 'Arte Poetica' was not the first vernacular poem on criticism (p. 46), but was preceded by an 'Arte Poetica' (Piacenza, 1549), which is attributed to Costanzo Landi, whose namesake, Ortensio, wrote, beside the famous 'Paradossi,' a 'Scourge of Ancient and Modern Authors,' with a supplementary 'Exhortation to the Study of Letters,' which Professor Saintsbury has not included. Professor Cook did not reprint Vida "with his two great disciples" (p. 30), but with Horace and Boileau. Trissino died in 1550, and therefore the whole of his book and not merely a part (p. 38, n.), must have been written before that date. The Baconian "idols" are not "ideals" (p. 87), and "Rote" (p. 51) should be "Rota." The mysterious "Pacius," mentioned among non-Italian writers on page 263, is no other than the Alessandro de' Pazzi of page 41, whose name appears in the Latin form of Paccius on his title-page. Nor do we understand why a manuscript note in Professor Saintsbury's copy of Minturno is relied on for the origin of that critic's name (p. 51), when a simple reference to Tiraboschi would give the real facts, and would show, too (p. 129, n.), that Minturno was a poet as well as theorist. Several of the names in the classified list of Italian critics at the end of Crescimbeni's 'Storia della Volgar Poesia' do not appear here, but on the whole the treatment of Italian criticism is exhaustive, and in a sense definitive.

The same neglect of the humanists noted above is to be found in the French and English chapters. To begin the former with Sibilet and Du Bellay is to ignore the preparation they received in such notable works as the 'De Studio Litterarum' and the 'De Philologia' of Budæus. Rabelais, who introduced humanistic ideals into creative literature, is dismissed with a brief foot-note (p. 141), nor is there any mention, in a subsequent chapter, of the dramatic controversy which in 1694 culminated in Bossuet's 'Maximes de la Comédie,' and which doubtless inspired Jeremy Collier to write his 'Immorality and Profaneness of the English Stage' in 1698. Gibert's supplement to Baillet's 'Jugements des Savants' is described as very difficult to procure, whereas it is reprinted at the end of the best and most accessible edition of Baillet, published at Amsterdam in 1725. Harvey's 'Rhetor' and 'Ciceronianus' are not mentioned, nor Dr. Carpenter's edition of Coxe's 'Rhetoric,' with its valuable introduction on English and foreign rhetoricians, while the treatment of Bacon is wholly one-sided.

For German criticism, Professor Saintsbury seems to have ignored the chief authority, Borinski's 'Poetik der Renaissance.' Buehler (p. 355) should, of course, be Buchler, and it is interesting to note that an edition of his work appeared in London in 1632 with some important Latin verses, 'Joannis Corneliadæ Angli.' It is untrue that there was no Dutch criticism in the vernacular (p. 363, n.), for, without considering the very notable prefaces of Vondel and Hooft, there are several formal treatises, including Rodenburg's 'Eglentiers Poëtens Borst-weringh' (1619), which is largely a paraphrase of Sidney's 'Defence of Poetry' (*cf.* Jonckbloet, 'Geschiedenis der Nederlandsche Letterkunde,' 1899, iii. 200 *sq.*). The indebtedness of Opitz to his Dutch, Italian, and French predecessors, which is so great as to make his book almost a purely imitative *rifacimento*, is ignored, and we miss the most important of his successors before Gottsched (p. 551), Morhof, the teacher of Wernigke, Wernigke the teacher of Menke, Menke the patron of Gottsched himself. In the Spanish section, the important critical preface of Torres Naharro's 'Propaladia,' which was published at Naples in 1517, and dedicated to the Spanish husband of Vittoria Colonna, is not mentioned, although of great consequence, both on account of its early date and the completeness of its dramatic theory. The chapter on the Italian Decadence suffers somewhat by the neglect of recent scholarship, such as Croce's 'Trattatisti Italiani del Concettismo,' and the accounts of seventeenth-century criticism in Foffano's 'Ricerche Letterarie' and Belloni's 'Seicento.' At all events, we miss some of the chief monuments of the period, Menzini's 'Arte Poetica,' Nisieli's 'Proginnasmi,' the critical writings of the great Galileo, and especially, in the next century, the all-important 'Scienza Nuova' of Vico, who is the founder of a new theory of poetic art opposed to that of all the old *preceptistas* from Vida to Castelvetro. There is no allusion to Portuguese criticism, which possessed critical treatises like those of Macedo and Francisco Manoel, and which in the struggle between Tassistas and Camoistas developed a controversy almost as important as that which raged about the 'Gerusalemme Liberata.'

These are for the most part mere errors of detail, but in the later portions of the volume some of the fundamental defects of Professor Saintsbury's method appear. Side by side with that "crystallizing of the neo-classic creed" to which the second book is devoted, there were being developed in Europe certain less tangible but no less important critical ideals which were later to fix and mould our own judgment of literature. This development appears in the evolution of the very term which at the outset we reproached Professor Saintsbury for neglecting to define. Surely, the term which appears on his title-page, and which he has stated as the subject of his whole undertaking, deserves historical explanation. The *de gustibus* of the ancients referred solely to food, and it was not until the seventeenth century that the word, and with it the classical phrase, was applied to literature. The origin of "taste" as an æsthetic term has been disputed, but it probably first appears in this sense in the

works of the Spaniard Gracián. There are still other words which were being coined, or rather were acquiring a new meaning, at this period—words like sentiment, fancy, wit, imagination, and the like—and the whole terminology of modern criticism was being formed. To this great ferment of critical thought there is no allusion in this volume, nor does Professor Saintsbury seem to know that the words he is continually using are not world-old. The humanists devoted themselves to the imitation and comprehension of classical antiquity; their successors formulated the results of this study into formal rules. But, in time, taste succeeded law as the criterion of literature, until with the beginnings of the romantic movement the element of the creative imagination was apprehended and included.

The inadequacy, or the bias, of the treatment of later French criticism is apparent in the discussion of Boileau, to whom twenty pages of tirade and polemic are devoted, and especially in that of Voltaire. Rousseau is brushed aside with the dictum that "if he had been a critic at all, he would have been on the revolting and romantic side" (p. 519), a rather startling assertion to any reader of Texte's well-known work, in which a hundred pages are devoted to "the part played by Rousseau in the evolution of criticism," and in which his actual accomplishment is summed up as "that of substituting the notion of a relative æsthetic, variable both from one period and from one country to another, for that of an absolute æsthetic." There may be compensation for all this in the excellent and often brilliant treatment of English criticism from Dryden to Johnson. Yet we cannot but regret the inconsistency or insularity which gives Rymer seven pages and Dennis six pages to Voltaire's four, while the single paragraphs devoted to Cervantes, Gracián, and Luzán compare strikingly with the three pages apiece given to such mediocrities as Harris and Bysshe. We miss an adequate discussion of "wit," which is central in the critical doctrine of the period; and in the exposition of the 'Essay on Criticism' there is no realization of the importance of the couplet:

> "A perfect judge will read each work of wit
> With the same spirit that its author writ,"—

which is not a mere paraphrase of Quintilian, but one of the first expressions of the oneness of the mental processes of genius and taste (*cf.* Croce, 'Estetica,' p. 502). The Dictionary of National Biography is followed in assigning Gildon's 'Lives and Characters of the English Dramatic Poets' to 1699 (p. 430, n.), but on page 145 of that book Waller is said to have "died about eight years since," which would indicate that it appeared about 1695. There are also several omissions in these two chapters, including the lengthy prefaces of Sir Richard Blackmore, Farquhar's 'Discourse upon Comedy,' and Mulgrave's 'Essay on Poetry.'

What has been actually accomplished in this volume, however, is far-reaching. Using throughout the method which he has consciously adopted—"that of giving the gist of particular books and the opinions of particular authors together, and leaving bird's-eye views to the interchapters" (p. 37)—Professor Saintsbury has traced the history of criticism, and given the substance of the chief critical monuments, in Italy, France, England, Spain, and Germany, from the end of the fifteenth to the end of the eighteenth century. In so enormous a field it is easy to discover errors both of commission and omission. But we cannot lay down this large volume without marvelling at the industry, the skill, and the wide reading which it exhibits, and wondering whether any other littérateur in Europe could have successfully covered the same all-embracing subject. Professor Saintsbury has acknowledged his indebtedness to his predecessors with such generous appreciation that it is impossible to withhold from him the praise that is justly his. A second edition may well eradicate many of the flaws of the first, and it is for the purpose of modestly assisting in this that we have concerned ourselves with so many trifling details. The completion of the whole work will mark an epoch in English criticism.

The Christmas Kalends of Provence, and Some Other Provençal Festivals. By Thomas A. Janvier. Illustrated. Harper & Bros. 1902.

Mr. Janvier has always taken his Provence pretty seriously. His new volume, made up of articles that have appeared in the popular magazines, continues this tone, especially in the opening section, devoted to the Christmas festivities in an ancestral dwelling near Avignon. This abode of the antiquarian squire is not quite a Bracebridge Hall, and the sentiment here approaches the least trifle to gush. In the second section, however, a Feast-day on the Rhone, and the third, the Comédie-Française at Orange, Mr. Janvier has a brisker, pleasanter, touch, which is much more in keeping with the way in which those merry gentry the Félibres, or new troubadours, of southern France in our day take themselves. To make a little monograph of the volume it would have been better to tell more about who these lively Félibres were; it seems taken for granted that readers know sufficient already, which is not quite safe in these days of many books and many subjects. They are the followers of the barber-poet Jasmin, and especially the pupils of Roumanille, who, in a half-humorous and entirely sprightly fashion, renew the old minstrelsy and the floral games, encourage writing in all the dialects of the tongues derived from the Latin, and even propose a political alliance among the peoples of Latin blood, and talk of "decentralizing" the egotistical supremacy of Paris by getting the provinces to think less humbly of their own initiative. The writer has under his eye at the present moment an almanac for the year 1903, in one of the coast dialects of Provençal, and this contains a list of thirty-two other publications, mainly almanacs too. These minor collections are the form in which the dialect writing chiefly sees the light. Roumanille and most of the other leaders are dead. Mistral alone remains, a dignified figure standing apart from the more eccentric manifestations of his associates; after his death, the troubadour enthusiasm is likely to decline rapidly.

The Feast-day on the Rhone is a steamboat excursion down that river, and it is given in parts with the dash of the unruly river itself. The excursionists take hold of hands and dance up and down the boat, putting strangers and all at ease, in the merry French manner; they are received by mayors and brass bands, and go ashore to breakfast and dedicate monuments, while admirers on high bridges deftly cast them down mammoth bouquets as they shoot the arches below. The most notable act of the Decentralization campaign thus far is the giving from time to time such standard pieces as "Antigone" and "Œdipus the King" in the ancient Roman theatre at Orange. It is the best theatre company in Paris that comes down to do this, so the conflict is not of a very bitter sort. The account of one of these occasions is a valuable contribution to our knowledge of a most interesting matter, and many of the strange artistic effects are rendered with a vivid charm of description which they merit. You enter by night through a dark passage; the vast dim interior is peopled with faces obscurely seen as if spirits; all the interest is concentrated, with a glow of light and color, on the stage, about which large trees have grown up from the stones. The chronic north wind of the valley, the *mistral*, takes a hand in improving the draperies of the actors. The acoustic properties are strangely distinct. Mademoiselle Bréval comes forward, her beautiful bare arms are raised, the wind blows back her robes in the most perfect classic folds, and she seems a living embodiment of the Winged Victory.

Ireland, Industrial and Agricultural. Dublin and Cork: Browne & Nolan. 1902.

This admirably prepared handbook to Ireland is an official publication issued by the Department of Agriculture and Technical Instruction, edited by William P. Coyne, the statistical officer of the department. It contains forty-nine separate articles, written by experts in the several subjects dealt with, describing the geology, topography, and climate of Ireland; its railways, canals, and banks; its educational institutions, so far as they deal with art and industry; the principal industries of the country, such as dairying, bacon-curing, stock-breeding, fishing, brewing, distilling, milling, shipbuilding, woollen and linen spinning and weaving. Many of the industries enumerated are in a state of decay, others are in their infancy, created or existing only by the assistance and guidance of the Agricultural and Industrial Department established in 1900. Some of those for which Ireland is best known consist of a single firm operating on a large scale. The shipbuilding yard of Harland & Wolf in Belfast has turned out some of the largest and finest ocean steamers, but, outside the works of this firm, shipbuilding hardly exists in Ireland. Guinness's porter brewery in Dublin claims to be the largest concern of its kind in the world. The market value of its stock is at present supposed to be over $100,000,000, and its yearly output approaches 2,000,000 barrels. The linen industry is concentrated in a small corner of Ulster, and is mainly in the hands of a few large firms.

Apart from these, other Irish industries are insignificant, though many present features of much interest, especially the home and cottage industries, which are helped along partly by the Department, partly by voluntary and benevolent assistance. Almost without coal, with much water but little water power, poor in minerals, Ireland's prospects of industrial development are small. The main source of Ireland's wealth and the means of subsistence for her pop-

ulation must always be the land used for farming, but the produce from that source is decreasing year by year. The population is steadily diminishing, having now fallen to less than four and one-half from nearly nine millions in 1847. Though that question does not come within the scope of this book, there can be no doubt that the system of land tenure and government has been the main cause of the great exodus from Ireland and the decay of agriculture. Besides evictions and "clearances" by landlords, public and private money was profusely spent in emigrating the people; but within the last year a society has been formed for "the preservation of the Irish peasantry"; the President is James McCann, a wealthy stock broker and large landowner; and associated with him are Gen. Sir William Butler and Mrs. J. R. Green, widow of the well-known historian.

The heavy freights on Irish railways and insufficient traffic facilities are admitted by this association, as well as by the Agricultural Department, to be a heavy tax on farmers. The articles on the railways and canals of Ireland describe very fully the chaos of the traffic system. The canal system, largely made by Government, is an "unfinished network of waterways of diverse depths and with numerous breaks of gauge." A canal connecting the Erne and Shannon, constructed fifty years ago with public money at a cost of a quarter of a million sterling, was never finished, and no boat has ever gone over it. Its completion would provide an unbroken waterway from Belfast to Limerick The mileage of all the Irish railways is little more than that of the Great Western of England, but the Irish railways "are controlled by nearly thirty different companies, each with its own directors and salaried officials." The Great Western of England carries four times as many passengers per train mile, and takes in for all traffic more than four times the total receipts of all the Irish railways. The average rate charged per ton for merchandise carried in Ireland is 37 per cent. more than in England. A continually decreasing population, the absence of competitive lines, and the many small independent companies make the Irish railway problem very different from that of England, where opposite circumstances have led to lower rates for all traffic, faster services, increased comfort, and higher dividends.

Irish railway rates are a heavy tax on the main industry of Ireland—farming. Agricultural instruction is the chief function of the department, of which this handbook of Ireland is to some extent an advertising puff. The special articles on Agriculture relate what has been done heretofore in the way of agricultural education, and what is now being attempted. It would be unfair to judge the department, only two years in existence, by its results, or to compare its work with similar work done in other European countries where efficient systems of technical and agricultural instruction have been in operation for half a century. It may, however, be remarked that the Statistical Survey of Irish Agriculture is based on the figures collected for many years by the police, and known to be both incorrect and misleading.

One feature stands out clearly, viz., that the country is rapidly going to grass. Districts once populous are becoming almost uninhabited ranches. There is litle agriculture because there is no one to till the land. The depopulation is most marked where the land is most fertile. The following remarks recently made in Glasgow by Archbishop Logue describe aptly the relation of the Agricultural Department to the people and the land:

"They have at present a department for improving the agricultural knowledge of the people. That was excellent, but there was no use improving agricultural knowledge when there was no land to till. What they wanted to get was the land, which was the chief source of wealth in every country. They could not get it. The land was given over to cattle, and the people were flying from the country. The people were the wealth of the country. If those who held the destinies of the Empire in their hands acted as true statesmen, they would endeavor to get the people on to the land. Cattle didn't pay taxes; cattle didn't smoke tobacco; and cattle didn't drink tea, and there was something else the cattle didn't drink in which he wished the people would be imitators! They would soon have no one in Ireland except the old and the weak who were not able to step into a railway carriage or climb the deck of a steamboat."

The account of the lace industry, mainly carried on in the poorest parts of Ireland, is one of the most interesting chapters in this book, which, in addition to the useful information it contains, has the recommendation that, being an official publication, it is sold at the low price of five shillings.

The Silva of North America. By Charles Sprague Sargent, Director of the Arnold Arboretum of Harvard University. Illustrated with figures and analyses drawn from nature by Charles Edward Faxon. Boston: Houghton, Mifflin & Co. 1902.

It is very gratifying to be able to chronicle the completion of a great undertaking, of which the early promise has been more than kept. When this work began, over twelve years ago, it was supposed that twelve volumes would amply contain the plates and descriptions of the arboreous and arborescent vegetation of the continent of North America above the boundary line of Mexico. As the investigation proceeded, it became apparent that more space would be required than had been originally planned. Instead of about 425 species, nearly 700 were becoming known, and supplementary volumes were imperatively demanded. One of these supplementary volumes has been made a free gift to the original subscribers; the other is sold to them at the low price of each of the earlier volumes—a generous policy which deserves special mention. Volume XIII. is devoted chiefly to the interesting group of thorns, a variable cluster of plants, unimportant in their economic relations, but presenting many curious features of great attractiveness to the botanist, especially to the botanist who considers distribution and slight adaptive variations as worthy of study. Ever since species in the vegetable and animal worlds have been regarded as representing the survival of the fittest (not by any means, always the strongest), the variations or "forms" have taken on a new meaning. Hence, the beautiful and wholly truthful delineations of the thorns, given by Mr. Faxon's pencil, assume a value of the first order, as permanent records of the conditions of the forms to-day, and as affording material for speculation as to the influence of environment.

It is not excessive praise to give these and all of the drawings by Mr. Faxon the very highest place among botanical figures. The drawings are spirited and accurate, and they are also, in the best sense of the word, artistic. They are never wooden; they never represent dried twigs and preserved parchment-like leaves; they are living. Such records are invaluable. Professor Sargent has gracefully expressed the indebtedness of the botanical world for the vast service which Mr. Faxon has rendered to botanical science, in his dedication of the closing volume—"in grateful appreciation of the skill and learning which for twenty years he has devoted to the Silva of North America."

As in previous volumes, the text is perspicuous, and the general information full. Professor Sargent is to be sincerely congratulated on the eminent success of his completed undertaking.

Egypt in the Neolithic and Archaic Periods. By E. A. Wallis Budge, M.A., D. Lit., Litt. D. Henry Frowde. 1902. 12mo, pp. xxiv., 222.

This book would have been an impossibility fifteen or even ten years ago. Within this limited time the veil has been lifted a little from the prehistoric period in Egypt, and we to-day have learned more about what antedated Menes, the first reputed King of Egypt, than all the intervening ages have recorded. This knowledge has come to us as the result of diggings that have been prosecuted with active zeal since about 1890.

The author is the well-known keeper of Egyptian and Assyrian antiquities in the British Museum. He is well acquainted with the work that has been done in the field, and he is also conversant with all that has been published in connection with it. His function in the present volume is that of digesting editor, and he has performed his task with sufficient detail to present the reader with an interesting and instructive report of progress. This book is the latest in the field, but it is not the last word. Its very form and style proclaim its temporary purpose and mission. To most readers it will come as a rather startling revelation because of lack of acquaintance with what has been accomplished in a decade and a half, but in the nature of things it must soon yield place to another book that shall take the story up at an earlier point, and fill in the outline with a multitude of details that will make those remote periods almost live again. But the whole story reads like a romance even now. It almost passes belief that we have an authentic picture of life above seven thousand years ago. Yet it was bound to come at some time, for the people who possessed a finished and elaborate system of writing in what we have been wont to regard as the very dawn of their history, must have also possessed a history that ran back into the twilight before that dawn. This history has begun to be made known to us, and Dr. Budge has summarized it here. In so doing he has performed a service, but it is one that he will have to repeat by somewhat frequent revision before the definitive book is produced.

It is the first of eight volumes in which the entire story of Egypt is to be told. Its style and appearance are popular, and everything indicates the author's purpose to provide a book suited to the compre-

hension of the layman who is interested in the general theme. The volumes of Flinders Petrie and of Maspero have a far more scholarly air; they may be taken as a sort of counterpart and supplement, one to the other.

American Traits
From the Point of View of a German.
By HUGO MUNSTERBERG
HOUGHTON, MIFFLIN & CO., Boston and New York.

The Stuarts
Illustrated by 16th, 17th, and 18th Century Art: together with some account of the non-political history of the family from James IV. to Prince Charles Edward. By J. J. FOSTER, author of "British Miniature Painters and their Works."
The American edition of "The Stuarts" is *strictly limited* to the following states, each 2 volumes.
***Edition Royale*, strictly limited to 15 copies, all the full-page plates being in color, at $350.00 net, each.**
***Edition-de-Luxe*, strictly limited to 75 copies, all the full-page plates upon India paper, and the frontispiece in color, at $100.00 net each.**
***Author's Edition*, strictly limited to 150 copies, with the plates upon hand-made paper, at $75.00 net, each.**
So far as the writer is aware, hitherto it has not been attempted to depict the Stuarts in one work. The author has brought together a succession of portraits, relics, medals, maps, and views relating to the persons, the adventures, and the surroundings of the chief members of this family, the story of whose fortunes has all "the perennial freshness of a fairy tale." Many of these portraits and relics are now presented by the best methods of reproduction for the first time. The whole series forms a pictorial history of the Stuarts from the days of Solway Moss to those of Culloden, in a novel and comprehensive form. All copies are numbered and signed by the author. Prospectus on application.

AGNOSTICISM

By ROBERT FLINT, D.D., LL.D., F.R.S.E.,

Corresponding Member of the Institute of France; Professor of Divinity in the University of Edinburgh; Author of "Anti-Theistic Theories," "The Philosophy of History in Europe," "Theism," etc.

Dr. Flint's new work is a valuable and interesting complement to his still widely read and much discussed "Theism." Regarding agnosticism as a theory of the limits of knowledge, the equivalent of philosophical scepticism, he nevertheless avoids the impropriety of appealing to his definition itself as an argument. The book is at once a history and a criticism of agnostic and partial-agnostic positions. Peculiarly interesting are its discussions among others of the views of Hume, Kant, Huxley, Roberty, Leslie Stephen, Paulsen, Spencer, Balfour, Sabatier and Ritschl.

$2.00 *net.* (Postage 20 cents)

$2.50 *net* (postage 28 cents)

ENGLISH OPINION

Spectator
"Amazingly interesting, even more so, perhaps, as a human document than as a treatise on war."

Times
"A work of consummate interest."

Daily Telegraph
"A supremely interesting book."

Daily Chronicle
"A noble addition to the epic of South Africa."

Standard
"Of deep human interest."

AMERICAN OPINION

Brooklyn Eagle
"Unique in modern literature. . . . Only a classical comparison can do it justice."

New York Sun
"Notable for its simplicity, directness, and sincerity."

New York Times
"Thoroughly readable—a story of important events well told."

Commercial Advertiser
"A rugged sincerity, a straightforward directness that is better than any amount of rhetoric."

The True Indian Life in Story.
Franklin W. Calkins. **TWO WILDERNESS VOYAGERS. $1.50.**
FLEMING H. REVELL CO., Publishers.

IF YOU WANT TO KNOW ALL ABOUT Ex-Speaker Thomas B. Reed's great library of MODERN ELOQUENCE, and if you would like a handsome portfolio of specimen pages, including fine photogravure illustrations, address the publishers, JOHN D. MORRIS & CO., 1163 Commonwealth Bldg., Philadelphia.

FOR SALE.
Several excellent copies from pictures in the Munich Alte Pinakothek. Address Box 10, care of the *Nation*.

A NEW AND VALUABLE INVENTION.—If you are troubled with holes in the heel-lining of shoes, or with sock or stocking heels wearing out too soon, and desire greater comfort in the wearing of shoes, send 15 cents for a pair of heel protectors, with directions for attaching them. RACINE HEEL PROTECTOR CO., Racine, Wis.

EDWIN LAWRENCE GODKIN.—Japan proof of Portrait, engraved on wood in the highest style of the art, sent, charges paid, on receipt of five dollars ($5) by GUSTAV KRUELL,
331 Main Street, East Orange, N. J.

AN EDUCATIONAL DIRECTORY

I.—The NATION stands alone in its field. It has a larger circulation than any politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in the NATION has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

The Nation.

NEW YORK, THURSDAY, JANUARY 22, 1903.

The Week.

The House Committee on Rules has agreed that a day shall be assigned for consideration of the currency bill known as the amended Fowler bill. Its principal feature is the granting of power to national banks to take out and issue notes to the amount of 25 per cent. of their capital against the assets in their own vaults; that is, without depositing security therefor in the Treasury. The bill provides, however, that, before receiving such notes from the Comptroller, the bank shall deposit cash in the Treasury equal to 5 per cent. thereof, to form part of a common guaranty fund for all notes so taken out and issued. Such notes are to be a first lien on the assets of the issuing bank, and, in the event of the failure of any national bank, its notes issued under the provisions of this act shall be paid at the Treasury out of the guaranty fund, and the Treasury shall recover from the assets of the failed bank an amount equal to its outstanding notes and pay the same into the guaranty fund. The bill is a first step in the direction of what is commonly termed "assets currency," and although this is not the first time that a committee of the House has reported in favor of that principle, it is the first time that the House has been in a mood to seriously consider it. It is fair to presume, also, that the House will pass it at the present session. It is not likely that the Senate will act upon it now, but its passage by the House will give it an impetus that will make its passage through the next Congress quite probable.

The drawback clause of the tariff law allows a refund of duties to anybody who re-exports an imported article either in the original or in a different shape. Thus, if tin-plate is imported and then exported in the form of cans containing oil, or salmon, or condensed milk, or what not, the duties on the tin-plate will be refunded, provided the exporter identifies the material as the same on which duty was paid. It is not easy, however, to identify the material. So much trouble and delay is involved in the process that in many cases it costs more than it comes to. So Mr. Lovering of Massachusetts has introduced a bill in Congress to dispense with identification altogether. Under this bill American-made tin-plate, when exported, would be entitled to the rebate the same as though it had been imported and duties had been paid. The theory of the blessed tariff is that it merely covers the difference in wages between the cost of the imported and the domestic article. If that is the truth, the domestic producer and the foreign producer stand on the same footing in the American market. Why should the user of the foreign article have an advantage in the export trade? That is what Mr. Lovering would like to know. But we should like to know how the case stands when the duty on the foreign article is 4000 per cent., as in the case of mica. Is the Government to refund to the user of domestic mica its value forty times over when it is exported as a part of some other manufacture? Will not Mr. Lovering's bill put our blessed tariff into too glaring a light and expose it to dangers not now dreamed of?

Reference has been made in our columns to an ambiguous clause in the Cuban treaty regarding the rates of duty on sugar coming to the United States from other countries. The ambiguity has been removed by the Senate Committee on Foreign Relations, which has changed the phraseology so that, "while this convention is in force, no sugar shall be imported into the United States from any other foreign country at a lower rate of duty than that imposed by the act of July 24, 1898"—that is, by the Dingley tariff. This amendment is probably unconstitutional, seeing that it takes from the House of Representatives for five years the power to repeal or reduce the duties on sugar, and prevents both President and Senate during the same time from entering into any similar treaty with any other sugar-producing country. Attempts to tie the hands of future Congresses and Presidents are always fraught with dangerous consequences. It is conceivable that the Republican party might again desire to put sugar on the free list as was done in the McKinley tariff. The Democrats may carry the next national election, and may desire to deal with the sugar duties in a broader way than the Cuban treaty provides for. Would that party give much heed to a measure which assumes the power to "tie up" both the Executive and Legislative branches of the Government for five years? If the Senate can exercise such powers for five years, it can do so for ten or fifty.

It should not be overlooked that other sugar-producing countries may retaliate if they find us discriminating against them in this wise. In the German Reichstag on January 14, Count Posadowsky-Wehner said that since the United States had abandoned the old interpretation of the most-favored nation clause, Germany would abandon it also in her dealings with the United States. What will Germany be likely to do if she finds that we have entered into an agreement with Cuba that we will not put Germany on an equal footing with Cuba, no matter what concessions Germany may make in return? This scheme is evidently another protective device of the beet-sugar men. If they cannot defeat the Cuban treaty, they think they can keep out the sugar of other countries and thus pay themselves for their magnanimity in admitting Cuban sugar at a small reduction from the Dingley rates. Perhaps the Democrats in the Senate may checkmate that move.

Washington oracles agree that the outlook for anti-Trust legislation comes down to about this: A law of some kind must be passed, for the President himself has said it; but it must be a "mild" law, for the Senate will permit no other. The sole problem is, therefore, how to harmonize the two demands; and it is not difficult to see that the "mild" opponents of Trusts, like the meek, will inherit the earth. Mr. Roosevelt's position is simply that he must have something; the Trusts want but little legislation here below, but want that little mild; the upshot will probably be a measure which will roar as gently as a sucking dove. The President's friends are using the argument that the corporations would be wise to make terms, since if they do not accept a mild-mannered bill, they will have to take one much more "drastic." But what does that threat mean? That the Democrats are to be brought into power to pass the drastic law? By the very supposition, the Republican party is to be prevented from doing it. But no such considerations have any proper place in the discussion. If there ought to be a drastic law at all, it ought to be passed at once, not held as a club over the heads of the Trusts to compel them to take something short of full justice. Let all the pending bills be supported or rejected on their merits, and not pushed by talk of worse to come if these fail.

The army is singularly fortunate with its reform legislation this year. Not only is the general staff bill well on its way through Congress, but the Senate passed last week the Militia Bill, which has already gone through the House. The Senate struck out one of the most important sections—that providing a reserve of 100,000 men who have been honorably discharged from the army, the volunteers, or the National Guard. These were to be required to report once a year to some officer of the War Department during an enrolment of five years. For this

reporting each reserve man was to receive $10 annually. This was the most radical feature of the Dick bill, which has represented Secretary Root's views from the beginning, and, as a new departure in American military procedure, it met with considerable opposition. Even without this, there is much of importance left in the bill as passed. It takes the place of long antiquated legislation, some of it dating back a hundred years. It defines the status of the militia as a body which may be used only to suppress insurrection or repel invasion for a period of three months. In other respects it creates a machinery by means of which volunteer armies may be promptly and properly raised and officered on the outbreak of war. It is distinctly the result of the military failures, miscarriages, and mistakes of the war with Spain, and should do much for the improvement of our State troops.

It is painful to record another interruption of the smooth and easy flow of private pension legislation in the House. As might be supposed, the trouble was caused by an inexperienced member, unfamiliar with the requirements of courtesy and mutual consideration on such occasions. Almost at the beginning of a recent pension-day session, Mr. Russell of Texas rose to call the attention of the House to the rapid increase in the number of private pensions granted by Congress. He even had the temerity to reduce his information to statistical form, showing that in 1898 Congress passed 394 private pension bills, carrying $67,014; in 1899, 300, carrying $45,186; in 1900, 684, carrying $117,759; in 1901, 707, carrying $120,192; and in 1902, 1,114, carrying $182,825. Not content with the unpleasant impression caused by these uncalled-for summaries, he alluded most inconsiderately to the current calendar of the House. On the calendar for January 5, he pointed out, there were 54 private pension bills. By January 7 these had been increased to 116, and by January 9 to 144. If this rate of increase continued, Mr. Russell feared, members would not be able to vote understandingly on the bills as they came up.

The idea that any member should want to examine a private pension bill naturally created a general laugh. Mr. Russell, however, was not permitted to get off with mere ridicule. Mr. Sulloway of New Hampshire and Mr. Grosvenor of Ohio questioned him sharply. Did he know anything about the pending bill? He admitted that he did not, declaring that the inability of members to examine all the private pension bills was the very point of his protest. But Mr. Sulloway and Mr. Grosvenor showed how barefaced was this attempt to dodge. If he knew nothing about the pending bill, why had he injected himself into the discussion? Would he tell them that? But Mr. Russell had sunk back into his seat, properly overwhelmed. The debate became general. Mr. Grosvenor engaged in a personal wrangle with Mr. Gaines of Tennessee, and Mr. Russell's figures were happily forgotten. Just to make sure that the irrelevant remarks of a new member from Texas had not thrown the House off its balance, it increased the already liberal allowances made by the Pension Committee.

In declining to exchange his arduous post for the Supreme Court Bench, Gov. Taft has given another admirable example of true devotion to duty. It will be remembered that he went back to the Philippines last spring with the fear that he might not survive the effects of a second stay in the climate of the archipelago. Now he has put aside the high office which he has long regarded as the goal of his ambition, in order to stick to his task as Governor-General. Failing Judge Taft, it is announced that the President will appoint Judge William R. Day of Ohio to the Supreme Court. This would be, it is presumed, in pursuance of the late Mr. McKinley's wishes and promise. Mr. Day has had a respectable if not distinguished career on the bench, and if the appointment must go to his circuit, it is possible that no better man in the line of promotion could be found. On the great Constitutional questions connected with Imperialism which in one way or another must again come before the Supreme Court, Judge Day is supposedly in accord with those who maintain that new blunders require new judicial opinions. That he was strongly against the annexation of the Philippines, appears in his dispatches from Paris as Peace Commissioner. He flatly told President McKinley that annexation was opposed both to "the spirit of our instructions" and to the "declared disinterestedness of purpose and freedom from designs of conquest with which the war was undertaken." Later, when the President insisted that the Commissioners demand the Philippines by the stark right of conquest, Mr. Day agreed with Senator Davis in holding such a claim to be valid neither in law nor in morals. One sees, then, how much he will have to live down if he expects to recover the good opinion of Imperialists.

A funereal atmosphere hung over the proceedings of the caucus which renominated Platt. Not one enthusiastic word was uttered; not a cheer raised. Like slaves flogged to their task, the Republicans present carried out their orders. It was a cheerless, depressing ceremony, and it has fallen like a wet blanket on the whole State. One perfectly heartless feature of the vote for Platt deserves comment. His supporters confidently expect him to die soon. They speak of him as already tottering on the edge of the grave, and say that his death will in a few months give the Senatorship back to them to dispose of as they please. Anything more inhuman than this measuring of the waning strength of a man whom they believe to be near his end it would be difficult to imagine. The Republican managers gloat over Platt's bodily and mental infirmities, and reckon up the days till he will be gone. For our part, we hope that he will live to serve out his term. We would not spare the Republican party one hour of the disgrace which his continued presence in the Senate brings upon it.

News from Senatorial contests reads very like news from the seat of war. Both Colorado and Delaware are as excited as if they were on the verge of civil strife—and perhaps they are. The Addicks people have threatened bloodshed; and in Denver armed men are guarding the various factions. Why should such giant passions be aroused? It is not a mere party advantage that is involved. The Republicans are safely in control of the Senate at Washington, no matter who may be chosen in Delaware or Colorado. What we see, in both cases, is something madder than partisan excitement. It is the mania of gamblers. Addicks and Wolcott are playing for enormous stakes. They think they see vast winnings in sight, and desperately call upon their frantic followers to lose no point in the game. This is the sort of spirit which makes too many Senatorial struggles take on the air of a contest between rival bandits; and which is undoubtedly intensifying the general feeling in favor of an election of Senators by popular vote.

Gov. Murphy of New Jersey comes to the defence of Trusts with refreshing frankness. He has no patience with " the clamor of the demagogue" (meaning President Roosevelt) who "needlessly alarms the people" by questioning "the power of the nation to deal adequately with its own." Who is the Trust's own, the Governor leaves in little doubt when he proposes a law to cut off the stockholder's remedy of seeking to "enjoin corporations or others in this State from carrying out plans adopted by them." This he would do by requiring the litigant to give an indemnity bond before applying for a writ of injunction. In no other respect do the corporation laws of New Jersey need amendment, according to the Governor. They would be absolutely perfect if they only made impossible such effective interference as the Steel Trust and the Prudential merger met with in New Jersey courts. Gov. Murphy's pæan in praise of Trusts will ex-

cite varying emotions in different quarters. The President, Senator Hoar, and Attorney-General Knox will be somewhat chagrined to learn that they have been getting so excited over just nothing at all. And when the irate people out West who think they are suffering from the operation of New Jersey charters, learn from the Governor that his State has "justly won the confidence of the country," they will think that he has exemplified his own saying that "it is time to clear the air."

The Governor of Indiana having removed the Sheriff who permitted a mob to take from him and lynch a negro prisoner, that delinquent is making strong efforts to nullify the law under which the Governor acted. When the Sheriff asked for reinstatement, Gov. Durbin himself listened to the testimony on both sides, and then declared that the removal was eminently justified. The Sheriff, having been chosen again at the last election, insists that he is still in office, and is acting as a county official; but it is plainly the duty of the State to oust him by force if necessary. Then he may have the constitutionality of the law tested in the proper way. The case is one of great interest, not only in Indiana, but elsewhere. The Governor acted promptly and courageously, and there can be no doubt that, if the law is upheld, it will have a tonic effect on many sheriffs, even in other counties and States, who might sympathize with lynchers. In Sheriff Dudley's case it appeared that he declined to fire on the mob because he thought the lives of the lynchers more valuable than that of the negro.

The shooting of Editor Gonzales by Lieut.-Gov. Tillman at Columbia is regarded as atrocious even by South Carolinian standards, since prompt measures had to be taken to prevent the lynching of the prisoner. What is wanted next is a fair trial of Tillman and a legal punishment—execution by hanging, since Gonzales has succumbed. But we doubt whether any penalty will be inflicted. Several years ago the most distinguished editor in the State, a man of high character, was assassinated in Charleston in broad daylight by a man whose degraded propensities had been interfered with by the editor not in the columns of his newspaper, but in the course of his duty as a citizen. The assassin received no adequate punishment. A passenger in the cars from Louisville to New Orleans, in the month of November last, buying newspapers from place to place, counted six violent deaths along his route, all occurring in a single day. And yet many think that we are peculiarly fit to take charge of the destinies of semi-barbarous people on the other side of the globe, and lead them into the orderly ways of civilized life.

Mr. Morgan's description of the so-called "Louisville deal," in his testimony before the Interstate Commission, is fully as interesting as his description of the Northern Pacific corner, in the Power suit last March. The details of the remarkable performances with the Louisville and Nashville Railroad shares have, to be sure, been given before. Every one knew already that a reckless group of speculators, known in Wall Street as the "Gates pool," had bought up, last spring, 306,000 out of the company's 600,000 shares of stock. They apparently paid a price some 20 to 40 per cent. above previous market values; at all events, the shares rose from 102 to 146. At one time, a Stock Exchange "corner," resembling that of May, 1901, was threatened, the "pool" having bought 50,000 shares newly issued by the Louisville Company and sold by its brokers, and the new shares having turned out not a "good delivery" in fulfilment of Stock Exchange contracts. The stockjobbers had undoubtedly bought with borrowed money, as they did again, with disastrous results, in the autumn months. But they had the shares, and the banking houses, fearing trouble to their other enterprises either in the stock market or in the railway world, induced the stockjobbing ring to part with its Louisville holdings. The ransom paid was heavy. For the "pool's" $30,600,000 stock—whose highest value, even in the great speculation of 1901, had been only 113—a price of $150 was paid last fall by the banking interests, the requisite capital being raised by the Atlantic Coast Line. This $42,000,000 corporation promptly issued $15,000,000 new stock and $35,000,000 fifty-year bonds to get the money, and thereby became the owner of the Louisville.

The passengers of the *St. Louis* and their friends and relatives have a just grievance against the International Navigation Company. Not in the history of steam traffic between Europe and this continent has there been so disgraceful an occurrence on a ship which is ranked as first-class. The company's manager seeks to explain that it should not be held responsible for an accident that took place after the ship was at sea. But he cannot deny that it was determined six months ago to replace the *St. Louis's* worn-out boilers, and that she has been kept in service ever since with steadily failing boiler power. Moreover, her outward trip was so long that she was started back again after only being twenty-four hours in port—an insufficient time, as everybody familiar with ships knows, to clean the vessel, much less to overhaul her boilers properly and perform the necessary repairs done in every engine room after a transatlantic run. So the *St. Louis* began her voyage home with boilers in such condition that she might never have reached port had she encountered a gale on the day she made a bare hundred miles or so. A well-managed line guards against such contingencies by having enough ships and by keeping them in good condition. Now the company finds itself reduced to two fast ships, although by favoritism of the authorities it has carried a large percentage of mails and secured more pay for them than any other, and received enormous payments for the use of its ships in the war with Spain. We understand now why this line has been the leading beggar for ship subsidies.

Emperor William's open patronage of some of the most radical of the higher critics of the Bible is a proof rather of his versatility than of his caution. Even in Germany, they are a little shy of seeing the indebtedness of the Old Testament to Assyrian and Egyptian ideas laid bare. In theological circles in this country, the name of Professor Delitszch has been one with which to affright the timid. There, you see what you are coming to with your audacious inquiries—turning the book of Daniel into a Chaldean myth, and making out Javeh to be a Babylonian conception! American theological students still go to Germany, however, on fellowships, though they are expected to return without the smell of heretical learning upon their garments.

Henri de Blowitz, whose death has followed closely his resignation from the Paris office of the London *Times*, was practically the last of the great correspondents of the old school. No one for years has more willingly assumed the oracular tone, no one so fearlessly made of prophecy a daily duty. But this was always true of Blowitz, that, while the average correspondent dealt in the appearance (quoting indifferently "the highest authority," "a sure source," or "a prominent personage"), he had in reality the secret springs of news. His French citizenship and social relations gave him access of the freest sort to the political world, and he kept about himself a curious little world of talebearers, adventurers, artists seeking notoriety, employees of those in great place—in general, all that part of Paris which has "exclusive intelligence" to give or to sell at a price. Though professionally he lived much in this dubious world, his own probity was beyond question. It was unfortunate as regards his permanent fame as a writer for the press, that his dispatches appeared not in French, but in the English of a London *Times* translator; and it must be said that his official solemnity was seldom relieved by wit. Indeed, he scorned the graces of the journalist, and undoubtedly felt that his letters must assume something of the form of state papers.

FREE COAL AND THE FUTURE OF THE TARIFF.

The debate in the Senate on January 13, on the question of putting coal on the free list of the tariff, brought into sharp collision Senators Dolliver of Iowa and Aldrich of Rhode Island, both Republicans. Mr. Dolliver represents the "Iowa idea" of tariff legislation—that when a given rate of duty is so high as to favor monopoly, it should be reduced, and when it is no longer needed, it should be repealed. The Iowa idea contains another postulate even more important in a self-governing republic—that it is the privilege of every man in public or private life to exercise his own judgment, to express his own opinion on the question whether the tariff tends to produce monopoly or to oppress the consumer or not. Mr. Aldrich stands for the opposing doctrine—that anybody who objects to any particular item in the tariff is opposed to the doctrine of protection. Not even the President of the United States is privileged to do so.

In the case in hand, the Senator from Rhode Island attacked the reciprocity treaties negotiated by the McKinley Administration and now supported by Roosevelt, saying that he (Aldrich) "never expected that a Republican Administration would negotiate treaties which would strike at the heart of protection." But Mr. Aldrich had intimated the previous day that he would support a measure to put coal on the free list for one year. So it appears that there are some things which may be done even in the way of amending the tariff, provided *our* consent be first obtained. Mr. Dolliver, not having the fear of any high priest before his eyes, adheres to the Iowa idea, and intends to use his voice and his vote just as though Aldrich did not exist.

The immediate subject of debate was the reassertion by Mr. Dolliver of the fact that the rates of the Dingley tariff were intentionally put higher than needful so as to leave room for treaties of reciprocity. Thus, for example, a rate of 50 per cent. would be sufficient, in the estimation of Dingley, for all decent purposes of protection, but it would be put in the bill at 60 per cent. in order to "come down" in favor of France, in return for some similar concession in the French tariff. This, by the way, has been the avowed policy of France and other countries of Continental Europe for many years—the policy of maximum and minimum tariffs. Enact your regular rates of duty on the maximum scale, and then say to other nations: "We will admit your goods on the minimum scale, provided you will make similar concessions to our goods." Nobody ever imagined that there was anything dishonorable in such a policy. On the contrary, it was held by statesmen and publicists of all schools to be defensible and even commendable in certain cases. Free traders looked upon it as preferable to Chinese wall tariffs, and protectionists held it to be necessary to have a tariff margin of this kind to serve as the basis of negotiation, and to secure what they conceived to be justice to themselves.

The Dingley tariff was undoubtedly framed with this idea. Such a policy would not be at all surprising, seeing that the reciprocity idea had been embodied in the McKinley tariff of 1890 at the suggestion of Secretary Blaine, and on the motion of Senator Aldrich himself. Yet when Senator Vest, a few days since, mentioned the fact in a guileless way as something well known, Mr. Aldrich charged Vest with an assault on the memory of the dead. He said that Vest was imputing dishonorable motives to Dingley, now in his grave and unable to defend himself. He (Aldrich) would hurl back the degrading charge and protect the memory of the departed statesman. On Tuesday week Senator Dolliver repeated what Vest had said as to the rates of duty in the Dingley bill. He spoke of his own knowledge, and denied that any taint of dishonor attached to a policy that is in practice in almost every country of Europe. To this Mr. Aldrich replied that if any friend of Gov. Dingley could remain silent while such charges were made against him, he did not understand that person's idea of honor. The public appreciation of Mr. Aldrich's sense of honor, always keen, will no doubt be much augmented by this outburst.

Meanwhile public opinion has forced the repeal of the tricky anthracite duty, and a rebate of duties on all kinds of coal for one year. This action, however, gives us but a crumb when we need a whole loaf. An impartial observer from the outside, looking before and after, would perceive the crying need of a large revision of our laws affecting—and crippling—commerce, both domestic and international. He would see this country getting into more and more awkward relations with its customers and its feeders. One of our laws cuts off a Russian trade; another harasses our exporters to Germany; a third shuts us out as far as may be from the great market lying to the north of us. In place of a fragmentary measure, jerkily done into law, in place of a miserable hand-to-mouth opportunism, we have a right to look for a broad commercial and financial policy. It is not necessary to appeal to the foreign observer to pronounce the proper verdict on our folly. We have men among ourselves to see the thing as it is. One of them is President James J. Hill of the Great Northern Railway. Whatever else may be said of him, he is a man of capacious mind and large comprehension of the commercial problems which confront this nation. Knowing the West and Southwest intimately, at home on the Pacific slope, keenly alive to Canadian development, and with plans which lay hold on New England and the Orient, he has, if any man has, a vivid appreciation of what should be done to enable the country to rise to the full height of its great opportunity. And what does he urge? Why, a general lowering of our tariff walls. At the reception to the Canadian Minister, Mr. Sifton, given by the Commercial Club of St. Paul, on January 10, Mr. Hill spoke up in the plainest way for the removal of duties from lumber, as well as coal and all raw materials, and in general, for so "modifying our tariff conditions" that trade will flow in its natural channels. President Hill was particularly emphatic about the need of an enlarged foreign market. We manufacture goods to the value of $13,000,000,000; we export only $440,000,000 worth. "Can we go on as a nation trading with ourselves, and getting money from one pocket into another, and get rich?" We must lift up our eyes. There, to the north of us, lies Canada, already one of our best customers, and ready to expand our trade relations indefinitely. She is inhabited by people who speak our language and know our methods, is a country where law is enforced and debts can be collected; yet "here on our Northern border we have a fence to keep them out, and now we shall have to build another fence to keep our own people in." Neglecting or coolly cutting off this great market at our doors, we spend millions to get a foothold in some far island where the trade of a century would not equal the Canadian trade of ten years; and if anybody proposes a change in the laws which shut us out from our own, he is scoffed at as a wicked free trader, or, if he is a Republican President, is told by Senator Aldrich that he is "striking at the heart of protection"!

It is this large demand of a critical hour which makes the recent grant by Congress, welcome as it is in itself, appear so beggarly. More than a year ago, President McKinley marked out a programme of general tariff reduction in order "to extend and promote our markets abroad." Nothing has been done, except to quail before public clamor long enough to repeal the coal duties. There is a lesson for Mr. Roosevelt in this. He urged making anthracite free, and that has now been done; but suppose that he had entered into the large conception of President McKinley, and, instead of belittling tariff reform, had struck out boldly for reciprocity and the freeing of commerce, would he not have made much better headway than he has done with his chosen anti-Trust programme? He would, at any rate, have shown himself a leader alive to the needs of our situation.

PATERNALISTIC FINANCE.

Mr. J. P. Morgan's testimony before the Interstate Commerce Commission on Thursday last was of far more than ephemeral significance. It explained primarily the means by which he had baffled the notorious speculator, Gates, temporarily in control of the Louisville and Nashville Railroad; but, taken together with Mr. Morgan's statements in the Northern Securities case of last March, it gave inferentially a complete theory of financial control of great corporations. Some have called Mr. Morgan's theory paternalistic. It might almost equally as well be called aristocratic or oligarchical, for it is based upon a profound distrust of democratic methods of corporation control. Everywhere, in his responses at the inquiry of last Thursday, appeared his conviction that there is a class whose plenary qualifications for managing great interests are generally recognized. He spoke frankly of the Louisville and Nashville transfer as dictated by "a personal interest of my own in the maintenance of the general business situation throughout the country." Equally remarkable with this perhaps justifiable presentation of himself as *deus ex machina*, or saviour of society, was his assertion that Mr. Gates was not a "proper person" to manage the Louisville and Nashville (an opinion in which all will heartily concur), and his expression of solicitude that the stock which he then held in trust should be placed in "safe hands." These terms must be interpreted in the light of all the recent manœuvring for control of railroads. So interpreted, "proper persons" are those who assent to the plan of an emergency committee, and "safe hands" are those which obey unfailingly a particular behest. That under this theory temporary emergencies of a very grave sort have been successfully met, and an unexpected degree of financial stability attained, nobody can question. But the theory must be weighed in full recognition of the fact that other patriarchs, certainly of less ability, and conceivably of less principle, must in due time succeed Mr. Morgan; how will paternalistic finance work under these ordinary conditions and through these average personalities?

The paternalistic theory sets up as rulers a competent oligarchy to check the depravity of speculative freebooters and the folly of the owners of corporate securities. It entreats the latter to surrender their vote, that is, their power, and it browbeats them on occasion, when they wish to be heard in stockholders' meeting. A considerable degree of oppression seems inseparable from the paternalistic idea. The inducement offered the *plebs* of finance to make it part with power and money is, that the power will be more wisely exerted and the money more judiciously spent by the governing class. The theory is that it is well for the shareholder to contribute, but evil to have any hand in the management of the property for which he has paid. The numerous voting trusts mean this or nothing. Long before Mr. Morgan's time the case against the mere shareholder was trenchantly put by Machiavelli in his 'Discourses on the Decades of Titus Livy.' The Florentine publicist writes that two things are to be noted of popular government:

> "The first is that the people, deceived very often by a false conception of what is good for it, desires its own ruin; and if not instructed by some one in whom it has faith as to what is good and what bad, infinite perils and injuries come upon the republic. And when destiny brings it about that the people trusts in no one, as happens at times, having been deceived in the past by events or by men, it inevitably goes to ruin."

Nobody will deny that financial, like political, control should be in the hands of the competent, nor that stable conditions in either field depend upon a certain faith on the part of the people in those set over them in authority. Where most thoughtful persons will part company with Machiavelli and Mr. Morgan is at the assertion that there is, broadly speaking, any better way of choosing our competent rulers than the democratic way. The inconveniences and even the perils of a plébiscite, whether of citizens or of stockholders, nobody will underestimate; but these perils seem small in comparison with those of an oligarchy or a despotism, however benevolent. Then, have we a natural governing class in finance, as by divine right? Can we believe that the temptations of financial control are less than those of political control? Have the events of the past two years—the reckless warfare of precisely the persons we are now asked to accept as the guardians of financial peace, the readiness of our *de facto* rulers in finance to accept the directorial name without assuming directorial responsibility, and to advance inordinate sums for stockjobbing on a perilous scale—have these facts, patent to all men, shown that we have a financial aristocracy so honest and so intelligent that it can safely dispense with the shrewd scrutiny and workaday criticism of the average investor? Granted that, under Mr. Morgan's paternal dispensation, we prosper and are cared for: could we trust his associates in perpetuity? Could we safely give up our right to turn out the rulers when they do ill? Could Mr. Morgan himself, had he the nine lives of a cat, safely trust himself with such power for more than one of them?

Mr. Morgan's financial philosophy points, we submit, to a better world than has ever been or ever will be. It is an attempt to eliminate from finance that average human weakness which in other fields is accepted as inevitable and dealt with as part of the day's work. It is in essence an endeavor to make transactions, necessarily difficult and contentious, artificially simple and unanimous. So radiant a counsel of perfection cannot be criticised with any unkindness. But its essential Utopianism should not be accepted as sound finance simply because it is the Utopianism of a great financier.

CANTEEN LEGISLATION TO WAIT.

The decision of the House Committee on Military Affairs that there shall be no canteen legislation by this Congress, defers the question of the sale of beer at army posts for another year. This is but fair to opponents of the Government's supplying drink to its soldiers, who induced Congress to appropriate $500,000 for recreation and amusement buildings, and who seek to interest and occupy the soldier in this way without recourse to spirituous liquors. The board of officers appointed to distribute this appropriation among the more important posts has only just concluded its labors, so that the work of construction can hardly be completed for another year. Among the important awards are $125,000 to Fort Myer, near Washington, for a building which shall contain a gymnasium, shooting gallery, swimming pool, bowling alleys, shower baths, etc. Smaller allotments have been made for the ten largest posts now garrisoned. In each case there will be provided club, reading, and recreation rooms, by which the enlisted men should be particularly attracted.

The Board has, however, set nothing aside for the benefit of the soldiers in the Philippines, where the need of entertainment and the temptations to loose living are far greater than in this country. The elaborate building at Fort Myer should enable Congressmen to see for themselves how a temperance club works, and also the necessity in every post for entertainment rooms similar to those in vogue in all important English garrisons. But a true test of the efficacy of these "exchanges" cannot, obviously, be made for two or three years. Whether they will serve the whole purpose for which they are intended remains to be seen; they cannot, however, fail to do much for the enlisted men wherever they are erected, and Congress should support the policy by additional and liberal appropriations.

Meanwhile, the War Department can, by various means, do much to increase the sobriety and orderliness of the army—now, according to the Judge-Advocate-General, at a low ebb. For instance, it can (1) call upon local authorities near army posts to abolish the low groggeries around them under threat of removing the garrisons; (2) it can hold commanding officers responsible for the conduct of their commands—an expedient never yet tried; (3) it can in-

sist upon the home garrisons being worked harder and kept occupied, as in foreign services; (4) it can improve the quality of its recruits and raise the age standard for enlistment; (5) it can stimulate company commanders to be true "fathers" to their men; (6) it can place additional responsibilities upon non-commissioned officers for the good conduct of their men, as is done in the English army with excellent results; and (7) it can devise a better system of giving troops their money than that of paying a whole garrison at a time. Should the War Department throw the weight of its great influence in this direction, there would be a marked improvement in the morals of the men, and, we believe, a great decrease in the number of courts-martial. There are to-day very few company officers who really feel a moral responsibility for the welfare and contentment of their men, particularly among the several thousand new officers who served first in the easy-going volunteers.

One forward step has already been taken in the direction of increasing the interest in athletics in the army. In several of the military departments into which the United States is geographically divided, orders have been issued designating one day in each month as a field day to be devoted to athletic games and exercises. There are to be individual and team competitions. Baseball and football are favored, as well as military events such as tent-pitching contests, the construction of emergency bridges, etc. Wrestling, boxing, fencing, running, and jumping are to be particularly encouraged. Undoubtedly this will help a great deal, especially in the direction of company and regimental pride. To this end competitions between posts and regiments are urged. But a much more pressing need is that of further military drill and exercises to keep the men happy and to occupy more hours. There is probably no standing army in the world which drills so little as ours. Before the war with Spain, there were many posts where all drills and marches were suspended from November until April, and this vicious condition still obtains in a considerable number of garrisons. In the Continental armies, the men go to bed night after night physically fatigued, and are the better for it in every way.

Whatever the final decision as to the beer canteen, the changes suggested above are of vital importance if the service is really to be made as efficient as it ought to be. However sincerely the War Department may believe in the sale of beer as a cure-all for the restlessness and intemperance of the soldier, it cannot shirk its obvious responsibilities merely because Congress declines to accept its view. That Congressmen take the attitude they do in face of the fact that a majority of the officers favor a return to the post saloon, is probably because of their being in so much closer touch with the feeling and wishes of the public than the army itself. To attribute their refusal to take up the question merely to the activities of the temperance societies is very complimentary to the latter—especially in view of the two years which must elapse before there is another Congressional election. The Committee's decision not to bring the matter up is, therefore, a distinct victory for those opposed to the sale of beer. Delay makes in their favor for more reasons than one. For instance, we think the readjustment of the army to its new conditions, along with the decrease in the garrison in the Philippines, will make next year's statistics of crime and drunkenness in the service vastly more favorable than this year's, which proved that one in every twenty of our defenders was tried and punished for military wrongdoing or for crime. Moreover, every postponement of action will make Congressmen more reluctant to reopen a matter which arouses intense feeling upon both sides, and which is popularly supposed to affect the votes of a great many earnest and high-minded citizens.

A CLEARING-HOUSE FOR PHILANTHROPISTS.

One of the most praiseworthy aims of the General Education Board is to make itself a clearing-house for the benefit of all who desire to contribute to the cause of Southern education. For this purpose it has established its office in this city, and has set about collecting material which will in time enable it to furnish complete statistics to any one desirous of investigating any school of any kind in the whole South. At the same time it will itself seek information as to the places where there is the greatest need of new schools or of money for old institutions.

This will enable it to perform a variety of valuable services. It will be in a position not merely to advise an intending patron that an institution is really wisely administered and efficient, but to warn him not to waste his money upon a school which is undesirable, in either its methods or its aims. In this way it hopes to run to earth or to render harmless a number of collectors who besiege the generous-minded in our Northern cities, ostensibly on behalf of struggling negro schools, but really in the interest of their own living expenses. This in itself would be a public benefit, for the number of such impostors is far greater than is currently believed. They profit by the prestige of the really worthy institutions, such as Hampton and Tuskegee, and are secure because of the difficulty of obtaining reliable information. Even when an institution is known to be in a good field, and to be working in the right direction, its patrons are apt to be in total ignorance of the worth of its actual administration or of its teaching force.

But the General Education Board has still higher aims. Its members recognize the economic wastefulness of the present methods of collecting funds. More and more canvassers come North every year whose expenses frequently make the cost of collections entirely too high. These agents get in each other's way, are often deeply humiliated by having to beg as they do, and frequently, by their numbers, almost drive into hiding those known to be generous. As in the case of Mr. Washington, the necessity of raising funds by personal appeals often deprives a school of a most valuable executive for a large part of the school year. The General Board hopes soon to address an appeal to the public of the North to make its donations through the Board. If we understand its plans aright, it will undertake to expend wisely gifts of one dollar or of a million dollars, and to render a strict accounting for all the funds it receives. Still another step would be for it to eliminate all canvassers and to ask at stated periods for donations for all worthy Southern institutions. The high character of the Board and its organization on a business-like basis, with the same kind of management as that given to an up-to-date railroad, should insure it not merely a hearty response from the philanthropic public, but the thanks of both applicants and donors.

Why could not a similar plan be followed by the charitable and philanthropic institutions of this city? For some years past there has been a steadily growing movement towards coöperation of that sort. Two years ago some meetings were held with this end in view, and there is now on foot an alliance of societies and clubs in the hope of making their influence in the coming Mayoralty campaign as effective as possible. While no permanent organizations have been formed as yet, charitable workers are beginning to see the advantages of coöperation, if only for self-protection. This was shown last winter by the readiness with which various societies came together to oppose Gov. Odell's bills relating to the State's institutions. But in the field of large charity there has as yet been no sign of that tendency towards consolidation which is so striking a feature of our industrial life. The number of charitable concerts, "smokers," entertainments, balls, fairs, and lectures grows distractingly every winter. Here, too, the cost of collection is very great. The printing of annual reports, of appeals for aid, the cost of postage, and the pay of hired workers are items that mount up rapidly. There is not even coördination between workers in the same sphere. The social settlements, for instance, seek each their

means of support in their own way, without reference to the needs of their neighbors—sometimes, we fear, regarded as rivals. Would not the growth of these valuable institutions be still larger and more advantageous if directed by business men through a central office? We are certain that such a union, even if merely a loose one, could overlook the whole field sufficiently to insure distinct economies of means and effort.

The suggestion is by no means a chimerical one. In Liverpool the Charity Organization Society appeals to the public on January first on behalf of every charitable undertaking in the city, except the purely religious societies. Every body thus appealed for, pledges itself to make no individual canvass for two months. This plan, which has worked well, was initiated by the Mayor, and there has been no difficulty in dividing the large funds thus raised. A somewhat similar movement, involving, however, the public institutions, has been tried in Denver, while the London Charity Organization Society, the pioneer association of its kind, frequently acts as the agent of generous persons who give annually a specified sum, but who wish neither the labor nor the responsibility of investing it wisely. What has been done elsewhere can certainly be done here. In the very nature of things, and in view of the astonishing growth of altruistic movements of every kind—in itself one of the most striking signs of the world's progress upwards—the present haphazard, happy-go-lucky system of dunning the generous must be amended unless we are to see the prompt organization of a "Philanthropists' Protective Association, Limited."

THE LATE EX-MAYOR HEWITT.

In the course of a life of more than eighty years, Mr. Abram S. Hewitt had acquired an authority over the minds of his fellow-citizens such as few kings enjoy. Among all the mayors known to the present generation of New Yorkers, he was the only one who gained greater influence after leaving office than he held before. Ordinarily, the man who holds the chief place in the municipality falls into comparative obscurity after leaving it, especially if he has been a candidate for reëlection and been defeated, as was Mr. Hewitt. The Democratic party which, to escape defeat, had nominated him in 1886, turned against him two years later. The Republicans who had supported him in 1886, nominated a candidate of their own, expecting to snatch a victory from the division of their adversaries. Thus it happened that, in his second campaign, which fell in a Presidential year, when party lines were tightly drawn, he ran on his personal strength only. Yet he received 71,000 votes from the substantial citizens of the metropolis who do their own thinking, pay their own way, and strive to keep the civic atmosphere clean.

Thus it was that, after leaving the Mayoralty, he still held the foremost place in the confidence and regard of the community. In every civic enterprise of magnitude he was among the first to be consulted. All charitable and educational movements looked to him for advice and help. All things that bore his stamp were recognized as sterling. Anything to which he put his shoulder was almost certain to move forward. In the Chamber of Commerce his counsel was sought on all difficult questions, and here his influence was unrivalled. Every topic that he saw fit to discuss was handled in a masterly manner. He marshalled his facts in faultless English and with logical precision. In public speech he was never at a loss for a word, and when he had finished one of his impromptu addresses in the Chamber or out of it, the listeners were always charmed and generally convinced. The reporters of the press, too, recognized his worth, and were forever attempting to interview him, because they knew that whatever he said would be eagerly read by the public.

Although best known as ex-Mayor Hewitt, his municipal service was not the most important part of his work. He had had a previous career of public usefulness and business celebrity that had made him widely known at home and abroad. His first political service was in the reorganization of Tammany Hall in 1871, after the downfall of the Tweed ring. This work was recognized by an election to a seat in Congress in 1874, a position which he held during the next ten years, except for one term when he declined to run. He was Chairman of the Democratic National Committee in the Presidential campaign of 1876, in which Tilden and Hayes were the opposing candidates. The Democrats carried the four Northern States of Connecticut, New York, New Jersey, and Indiana, and Mr. Hewitt's sagacity and energy and character contributed largely to those successes. When the country was threatened with civil commotion in consequence of the closeness of the vote, his voice was for a peaceful mode of adjustment.

During Mr. Hewitt's Congressional service the fight over the currency question was unceasing and often bitter, and it was his fate to be one of a small minority of sound-money men in his own party; but he never swerved. Whether the prevailing craze was for paying bonds with greenbacks, or for remonetizing silver, or for coining Bland dollars, or for taxing United States bonds, or for worrying the national banks, he was always on the side of good faith and an honest dollar. He was also an aggressive fighter for the principles he espoused. There was not a keener, stronger, readier debater on the floor of Congress. There was also a vein of humor in his composition which not seldom came to the surface in his Congressional speeches, making him one of the men to whom other members were always attracted. He was admirably equipped by study and business experience to discuss the economical questions of the day, such as money, banking, tariffs, public debts, manufactures, commerce, and taxation. On these and kindred subjects he was equally ready on the stump, and, although not a frequent speaker, was always an effective one. His best oration is the one which he delivered at the opening of the Brooklyn Bridge, a masterly production from all points of view.

In a life of such varied usefulness it is not easy to single out the one thing by which he was most distinguished, but we should not be far wrong in pointing to his efforts in behalf of education as one of the most important ends to which he devoted his powers. The Cooper Institute was the object of his solicitude and unwearying energy for forty years. Columbia University was proud to count him as trustee and chairman of its leading committee; and the last and greatest distinction which came to him in this part of his career was that of presiding officer of the Carnegie Institution—an honor conferred by the unanimous choice of its trustees.

In private life Mr. Hewitt was one of the most attractive of men. Although a martyr to insomnia for twenty-five years, his spirits were generally buoyant, his conversation animated, and his sense of humor unfailing. At his country home on the Ringwood estate he practised a generous and graceful hospitality, the charms of which no one who shared it can ever forget. His business life was signalized by an unusual honor bestowed by a joint convention of the Iron and Steel Associations of England and the United States, who conferred upon him the Bessemer gold medal for services in promoting metallurgical science. The works of Cooper, Hewitt & Co. have always been a model, and have never had a strike among their workmen. The Trenton shops have often been run for long periods without profit, and sometimes at a loss, in order to keep the men and their families from suffering.

A career of such varied activity and usefulness it has seldom been our duty to chronicle. Such a life does not end when the mortal remains are deposited in the tomb. It abides with us as a guide and inspiration to those who now live, and to those who shall come after.

OBSERVATIONS IN A BIG UNIVERSITY.

I.

January, 1903.

The university in question is a State university in the Far West, and the observations are made by a woman in the early

thirties, unmarried, a graduate of an Eastern woman's college, Agatha Grayson by name. Why she came to live in the town of Westerley, as we will call it, and, as a result, to study in the university, is unimportant to this article. At all events, once there, she found her mind dwelling on the problems that the university suggested, to the exclusion of her own private affairs. The big, free, coeducational university struck her as an institution distinctly modern and characteristically American. Therefore, it was not surprising that the conditions were perplexing, that the problems were baffling, that the evils were so great as to set her wondering if there were compensations large enough to balance them.

As it happened, she had been reading Amiel's 'Journal' for the first time, and certain passages over which she had passed blindly, with eye unquickened by the knowledge behind all seeing, came back to her with vague, haunting insistence; and now, reread and understood in the light of her new experience, she found herself verifying them. "'Commonness will prevail,' as De Candolle said in speaking of the graminaceous plants. The era of equality means the triumph of mediocrity." "Commonness will prevail!" Agatha found herself repeating the phrase in a sense other than Amiel's as she looked about her on the campus, in the library and classrooms, seeing everywhere faces and tones that remained uneducated in spite of the piles of books under the arms. Was a course of study a success that left a boy or girl still saying, "Yer 'not a'goin' to," or "awful tired"; that had no power to soften an over-robust "r" or to refine the tone of voice? Were students in the future to lose the stamp that in the past had been recognized as indicating a university education? Were their four years to stand for nothing but a certain amount of information? Was the student to be no higher up the ladder of humanity at the end than at the beginning? Were education and culture to be hopelessly divorced henceforth?

The thought came to Agatha that perhaps she had been overestimating the absolute refining value of education. Perhaps the value had lain more in the association that education had brought about than in the books themselves, and in the extension of education such association was minimized. In the old days a student from a home lacking in refinement went to college with his superiors, now he went with his peers. Consequently, the elevating power of a college education now lies wholly in the student himself; it is always the result of conscious effort. If a student has slight will power or small perception of differences, he will learn nothing outside of his books, for his associates have had no better advantages than himself. In the old days he was the passive recipient of the education due to constant contact with his superiors.

In her own college days, Agatha had more than once seen a student enter the freshman class with accent and manner that betrayed an uncultivated home. The majority—all, perhaps—of her classmates were her superiors, externally at all events. Her transformation was, with hardly an exception, miraculous. Then, the class groups photographed at entering and at graduating were object-lessons as to the value of a college education. In the year she lived at Westerley, Agatha saw no such miracle. The students developed, of course, but only as a man develops among his equals. It was always a development, never a transformation. As she had more experience of the various classrooms, Agatha wondered at this the less. There were no models. There was a little more or less scholastic attainment, but so few examples, comparatively speaking, of superiority in intonation, accent, or taste that these were lost in the wilderness of mediocrity. The classes were so large that the personality of the instructor had only an intellectual value. There was no chance for personal contact, for striking the human note. The university had come to be simply the culmination of the free public-school system, with all the unavoidable evils of a free public school.

Agatha had nephews and nieces with their education still before them. The family had looked on the State University as the natural place for them to go; but Agatha had not been six months in Westerley before she decided that, at any sacrifice, they must be sent elsewhere, and this with the conviction strong upon her that in no institution could they be offered better opportunities in the education that comes from books. Indeed, as she went in turn from one department to another, she was filled with wonder at the uniform excellence of the instruction, its breadth and depth, the personal importance of the majority of the instructors, the spirit, industry, and attainments of them all. She found nothing of dogmatism, nothing of conceit, no working in ruts. Instead, she found a readiness to acknowledge mistakes, an openness of mind towards opinions other than their own, a love of their work, and an invincible determination that each year should find them better fitted for it. They were as a whole a fine body of men, accurate, scholarly, progressive, creative, wise. It cost her a pang to think that the children should not come into contact with such men as she knew these to be.

But the contact with their fellow-students—that was quite another matter; not but that there were hundreds whose tone and manners were such that even the most anxious maiden aunt must approve; and Agatha had no fear that the children would go outside of these for their personal friends. They might not deteriorate in tone with the home influences back of them; but was it possible that they should improve? What an atmosphere in which, for instance, to combat the slanginess of the present generation! The children were even now convinced that Aunt Agatha was over-particular in objecting to many of their expressions; but where would her influence be in a community where at every turn were to be heard bits of conversation like the following: "Come to the Frat. this aft., Piggie?" "Can't. Got an ex. in Math. Prof. sat all over me yesterday, so I guess I'd better take a brace." This was the third year of these girls in the university.

Agatha was not narrow enough to condemn all slang. Some seemed to her piquant, picturesque, pleasing, and she used it herself occasionally with satisfaction. Some, however, was simply vulgar or pointless. It was to the misuse of slang that she objected, to the universality, to the lack of discrimination in the choice of it, to ignorance of where the boundaries of good English ended and those of slang began. If one sinned against the former, let it be done deliberately, in knowledge, not in ignorance. In her own college the use of slang had co-existed with a certain reverence for the language. There was, besides, a large element to be found there to which such expressions as "O, my!" and "Goodness gracious!" were not native; an element having a rudimentary sense of the vulgarity of abbreviations and nicknames. There was no such element in Westerley.

The realization of the sanctity of language and the duty of the individual towards preserving its purity does not come in the teens, and yet it is then and even earlier that habits of speech are formed, a discrepancy that makes the matter of association all-important. It was only of late years that Agatha had come to realize what she called, in the privacy of her mind, the sloppiness of her own speech. She had grown up in ignorance of the niceties of language, feeling vaguely that her own speech jarred upon her in some companionship, but without knowing why, until severe criticism of a little book she wrote awakened her to her own deficiencies. Being a parvenue, as it were, in speech, she took it seriously, and could not reconcile herself to the thought of those dear boys and girls growing up in the same obliviousness. And yet, if they came to the university, how could she give authority to her wishes with the vast amount of evidence to the contrary? The usual protest of, "It doesn't matter: every one says it," would seem to have truth on its side. But it was the tones of voice even more than the words uttered that distressed her. Was there to be no outward mark by which one could tell a university girl from a shop girl?

From this point her thoughts usually went on to the further question: Was it fair that the whole tone of the university should be lowered to meet a popular demand that was based on a delusion? Few individuals out of the hordes that the public schools were turning into the university had any real aptitude or desire for an education. They came for various reasons—many, because it was the alternative of going to work; most, because the education idea was in the air and they grasped at it without any discrimination as to its fitness for their need. No doubt a college education is of some value to every one, but it is of great value only to those who have the ability to overcome difficulties to get it. The thought came to Agatha that true justice would do away with the accrediting of the schools. It was not fair to the real students that they should be swamped with all this inert material, that the tone of the class room should be lowered and individual progress checked by the stupefying presence, the hampering participation, of incapacity. There are few instructors who, contrary to their natural inclinations, do not put their stupid pupils before their clever ones, adjusting the classroom work to the needs of the dullest of these. But if an examination were necessary for entering the university, would not this exclude the element that simply drifts in? Why should education be made so easy? Nothing else is that is worth while. So long as a university education is free, no

boy or girl who really wants one, who has not merely been inoculated with the germ of the education idea, will be deprived of it. The course of study in the high schools that are now accredited is an adequate preparation for those who are mentally equal to university work, and those who get their preparation in irregular ways have, in any case, to pass an examination.

The buoyancy of a university may be great, but it cannot float more than a certain amount of dead weight and not sink itself. The students who work their way through college are, with few exceptions, absolutely dead weight, with the result, oftentimes, of spoiling a housemaid or a ploughboy. Agatha's indignation would once have been roused at any one who ventured to suggest that their presence could be other than a pride to any university. Her years in Westerley taught her to put aside her sympathy and sentiment and to accept the facts as they really were. Owing to the inelasticity of the twenty-four hours and the small value of unskilled labor, it is practically impossible that a student should support himself and do his college work in such a way as to be floating rather than sinking material. The rawness, ignorance, uncouthness of many of these students was inconceivable; and here in a free university they did harm by their mere presence, such as they would not have done at Harvard or Yale. Agatha had always held fast to the belief that no work is demeaning, but she found herself obliged to change it to "No work done for one's self or for others without pay is demeaning." The students who waited at restaurant tables or lived in people's kitchens as their hired men *were* lowered. No matter how strongly one wished to believe the contrary, one had to recognize the truth. A student who had spent his four or five years in stable and kitchen bore no mark of a university education. His course had done so little for him as a man, that it seemed a pity to have worked so hard for such inadequate results. Of course, when he came to the university for some technical training for a definite purpose, the case was different.

Even if she had been the arbitrator of human affairs, Agatha could never have brought herself to decree that the admitting of such students should be discouraged; nevertheless, she felt that the facts must be faced, and their detrimental effect recognized and, as far as possible, counteracted. The requiring of entrance examinations would, of course, do much beneficial weeding out. It is a great mistake to think that a college education is a good thing for every one who wants one or thinks he ought to want one. He must have reached a certain point intellectually before he can receive any great benefit. Here Amiel came into Agatha's mind again: "All teaching depends on a certain presentiment and preparation in the taught; we can teach others profitably only what they already virtually know; we can give them only what they had already."

Once the element that was wholly incapable, or wholly frivolous, was excluded, the scholastic tone of a free university might be the highest of all, for in it there would not be found the element that goes to college for the social prestige of it, or for the making of advantageous social connections. In the university thus purified Agatha found the great problem before her much easier to solve; for she did not accept the common belief that purity of intonation and speech can be learned *only* by association. It seemed to her that much more could be done in the classroom than was ever attempted, and she spent hours in devising courses in which actual training in everyday speaking could be given. She founded—in her imagination—a society to promote purity of speech and accent. The meetings of this club had a recognized value in units of college work. Every professor and instructor in the university became a member, and instruction in English speech became a part of every course. Or, on other occasions, Agatha put herself in the place of the President of the university, and in his person set forth on a search for the man who could grapple with this need. It would take a man of peculiar gifts, young, vigorous, enthusiastic, with magnetism and personal consequence. The time had come for a revival, a crusade. Only the most strenuous, most exhaustive means would avail, but, given the right man for a leader, they would avail. "An education in this university must be made to stand for culture"—these words should be written on the heart of every member of the faculty.

Another needed reform that forced itself upon Agatha's attention was a reduction in the number of hours' work that a student was allowed to take, at least in certain departments. It was impossible for a student in the College of Letters, for instance, to take sixteen or eighteen hours a week and do the work even tolerably well. Fourteen hours should be the limit. Besides the obviously evil results of any greater number, the effect on the students' mind and morals was bad. It encouraged unconscientiousness and slovenly, inaccurate work. The impossibility of doing the work required in any but a most superficial way influenced the students' habits of mind for life. Then, too, the nervous strain of going to class with a lesson half-prepared, in the dread of being called upon to recite, was infinitely harmful. The instructor should meet the student half-way and require only such work as could be done in a given space of time; but what he did require, on this he should insist to the utmost.

In Greek, for instance, Agatha had always felt that it was impossible for a student to give time enough to prepare a lesson really well. Her plan would be to specialize in each recitation; that is, she would announce at one the points that she would dwell upon at the next. For instance, at one recitation, the specialty should be a consideration of dialectic forms; at another, especial attention should be given to translation; at a third, the metre should be studied to the last doubtful quantity. In the specialty of the day she would require perfect work, and would supplement the necessarily superficial work on other points by explanations of her own. On some days, for instance, she would herself explain all the mythological, historical, and geographical allusions, realizing the large amount of time that this sort of research demands. There is no mental or moral injury in superficial work when, with a recognition of human and temporal limitations, it is avowedly superficial; it is superficial work masquerading as thorough that kills.

THE PRINCESS BELGIOJOSO.

PARIS, January 1, 1903.

Among the persons who were mixed up with the movement of the *Risorgimento*, Christina Trivulzio of Belgiojoso takes a secondary but not unimportant place. She has lately been made the subject of a curious work by M. Raffaello Barbiera, 'La Principessa Belgiojoso, i suoi amici e nemici, il suo tempo' (Milan: Treves). The Princess Belgiojoso appeared in Paris for a time like a sort of meteor, and she became acquainted with all the celebrities of the day. Her life reads like a novel—I may say, like the wildest of novels.

She was born in Milan June 28, 1808, the daughter of the Marquis Girolamo Trivulzio and of the Countess Gherardini. The Trivulzios are members of the greatest Milanese nobility, and have played a part in the history of Italy since the twelfth century. Among the curious monuments of Milan is the tomb of the Trivulzio who was made Marshal of France and conquered Northern Italy in the name of Louis XII. Under the statue of the warrior are these words:

"Qui nunquam quievit, quiescit."

They might have been written also on the tomb of Christina Belgiojoso. Her father threw himself into the liberal movement which followed the French occupation of Italy after the Revolution. He became a chamberlain of Eugène Beauharnais, the Viceroy of Italy. The young Christina was educated in an atmosphere hostile to the Austrian rule. She was married at the age of sixteen to the Prince Barbiano of Belgiojoso, who was twenty-four years old. The marriage was not happy, and in 1830 they separated amicably, without having recourse to judicial proceedings. The young Princess left for Switzerland. As her husband was a Carbonaro, she was under the eyes of the Austrian spies; she remembered that, by a decree of 1808, all the Trivulzios had the right of citizenship in Switzerland, and obtained an official declaration which made her a citizen of Ticino.

It was at that time that Mazzini founded a new sect, Young Italy, whose object was to free Italy from the Austrian yoke. Among the associates of this secret society were many members of the Italian aristocracy, especially in Northern Italy. Mazzini's enthusiasm inspired his followers with unbounded devotion. He was a gentleman, a writer of talent; he had much eloquence and a great power of organization. The Belgiojosos, husband and wife, entered into the society, which paved the way for *Italia una*. The Princess lived successively in Ticino and in France—at Antibes, Toulon, at Marseilles; in this last town she learned that the Austrian Government had sequestered all her property. She was ordered to return to Milan within three months, under pain of being declared civilly dead and of having all her property confiscated. Though her property was sequestered, she found the means of giving 400,000 francs towards the unfortunate plot directed against Carlo Alberto, whom Mazzini accused of betraying the Italian cause. Gallenga (who afterwards became a correspondent of the London *Times*) was to introduce himself in the palace at Turin and to assassinate the King. The plot was revealed; Gallenga and Mazzini were condemned to death *ad contumaciam*.

The Princess lived for some time in the

island of Hyères during a trial for high treason, in which she was implicated along with her husband. She was in bad health, but refused 40,000 francs which her husband offered her, knowing that he was himself in debt, and left for Paris, the great "refugium peccatorum." When she arrived there, in 1833, Paris had become the principal centre of the Italian emigration, which included Rossi, who afterwards became French Ambassador to Rome and Minister of Pio Nono, and who was assassinated in Rome on the 15th of November, 1848, Nicolò Tommaseo, Gioberti, Count Mamiani, Sirtori, Amari, Gen. Pepe, and Count Charles Pepoli:

"The Princess," says M. Barbiera, "arrived in Paris without any noise, and took lodgings in one of the most outlying quarters, in the upper story of a house inhabited by poor people. She painted fans as a means of revenue, saying that she had nothing to live on, as the Austrian Government had sequestered all her property. I don't know if it be true that she put on her door a card with these words: 'The unhappy Princess.' Perhaps the unhappy Princess exaggerated her poverty in order to make the Austrian Government more odious. What is certain is, that she was not living in affluence.

"A young man, of short stature, but of great talent, as soon as he saw the very handsome Italian Princess, was seized with a violent passion. He was the man who some time afterwards was to direct the affairs of France. Adolphe Thiers frequented much the house of the Princess. He used to go into the kitchen and cook the eggs for breakfast when he was invited. The breakfast, to be sure, consisted only of eggs, butter, and plain water, which the Princess poured majestically into glasses adorned with various paintings which she had made herself. But the napkin was of the finest Flanders linen, and the brown head of the goddess of the place shone marvellously, surrounded as it was by a rich mantle, which imitated an Oriental turban, and the folds of which fell over her shoulders."

There is no doubt that Thiers felt much admiration and affection for the handsome and gifted Princess; she never felt anything but friendship for him, and took advantage of his sentiments in order to convert him into a supporter of the aspirations and the claims of Italy. Thiers made at that time several speeches in favor of his friend's country. The Princess herself spoke of Italy, and wherever she went she found supporters in all ranks of society. Madame George Sand was one of her admirers. She visited the salon of old Gen. Lafayette:

"The General," says M. Barbiera, "used to sit by the fireplace in his salon, which was furnished with great simplicity. He was an old man, very tall, thin, pale, wearing a brown wig. An eminent Italian was often at his side, Gen. Pepe, who had served in the army of Murat and fought the Austrians at Rieti in 1821. . . . There were few ladies in this salon, which was properly a circle of men; among them was the Princess Belgiojoso, near whom sat a Quakeress, Mrs. Opie, whose curious dress made a contrast."

In 1834 the Princess would have a salon of her own. She took a hôtel between court and garden in the Rue d'Anjou, not far from the house of Lafayette. She was now receiving large sums from Milan, and furnished her hôtel at great expense. "Her large salon had its walls covered with a brown, almost black, velvet, sprinkled with silver stars. It had the aspect of a *chapelle ardente*." The other rooms were covered with white silk; all the ornaments, clocks, candelabras, were of silver. She was fond of contrasts, and liked to astonish people. In her study were seen enormous folios, the works of the Fathers of the Church. She really read them. She had a *prie-Dieu* with a death's-head at its foot. The result of her studies was an 'Essay on the Formation of the Catholic Dogma,' a purely orthodox work, in four volumes, which is not, it seems, without some merit. She did not put her name to it; but her secret was soon discovered, and her friends wondered how she could make her orthodoxy accord with her revolutionary doctrines, and how she found so much time for working, leading, as she did, the most worldly life. She wrote afterwards an 'Essay on Vico,' and 'New Science,' a translation of the Neapolitan philosopher's 'Scienza Nuova.'

Among her new friends were the pious Ozanam, Sirtori, a priest of Milan, who had left the church (he became afterwards a Garibaldian officer and a general in the Italian army), Cousin the philosopher, the poet Heine. She appeared before them in the dress of the "Grey Sisters," which she did not abandon even when she went to the Italian Theatre, as she only took off her bonnet and put some flowers in her beautiful black hair. Musset was one of her visitors for a time, but they soon quarrelled and he wrote on her these cruel verses:

"Elle est morte, et n'a point vécu;
Elle faisait semblant de vivre.
De ses mains est tombé le livre
Dans lequel elle n'a rien lu."

M. Mignet, the historian, the great friend of Thiers, became one of her favorites, along with the historian Augustin Thierry, who afterward became blind, and to whom she showed the greatest devotion in his misfortune; Thierry was her guest for twelve years, and lived in her hôtel, receiving every attention. The Princess was as generous as she was eccentric.

She lived in a perfect whirlwind in Paris: the number of her admirers was legion—Chopin, Liszt, Thalberg, Döhler, Mario and the Grisis, Meyerbeer, Delacroix, Victor Hugo, Alexandre Dumas, Balzac, etc. A reconciliation took place between Princess Belgiojoso and her husband, who for a time lived on the ground floor of her hôtel; but it did not last long. One morning, the Duchess of Piacenza ran away from Paris with the Prince. They went to Italy, where they remained for eight years in a villa on Lake Como. In 1845 the Princess founded a newspaper, the *Gazzetta Italiana*, in defence of the Italian cause. She was allowed to live in Milan, and afterwards on one of her estates, where she was absorbed for a time in agricultural pursuits. At the time of the Revolution of 1848 she was in Naples. She formed a battalion of Neapolitan volunteers, whom she herself conducted to Milan. Her "giovanetti napolitani" joined the Piedmontese army, but never saw the enemy. She was herself not satisfied with the Piedmontese Government and revisited Paris, but returned to Italy when the Republic was proclaimed in Rome, renewed there her acquaintance with Mazzini, and conducted an active propaganda for him and the short-lived Roman Republic. After the capitulation of Rome she led a wandering existence in the Holy Land, in Asiatic Turkey. She bought land in Anatolia, and led a purely Oriental life, often under the tent. She tired of this after a while, and returned to Turin, where she founded a paper, *L'Italia* (still in existence in Rome), and wrote many interesting articles for the *Revue des Deux Mondes* on the East and "Italian Unity." She retired, in the end, to Blevio, on Lake Como, and ended her agitated life, almost forgotten, on the 5th of July, 1871.

Correspondence.

THE INDIANOLA POST-OFFICE.

To the Editor of The Nation:

Sir: I have read with infinite regret your brief editorial in your last issue approving the President's conduct in closing the post-office at Indianola, Miss. Has it occurred to you that the closing of this post-office, without warrant in law, or, as we think, in reason, will be regarded by the mass of our people as partaking of "Lynch Law" itself, and will lend plausible excuse to those disposed to commit such crimes and ruin the moral influence which our best people exert against lynching?

The action itself is condemned by all our best people, both Democrats and Republicans. The President is punishing not only the white people of Indianola, but eight millions and more of black people as well, by lessening the spirit of kindness and good-will on the part of some twenty millions of white people towards them.

God knows the mass of the negroes need all the charity and kindness of their white neighbors, and he is no friend of theirs who lessens such feelings towards them. Such punishment is cruel and unusual, contrary alike to the spirit and the letter of our national Constitution. The President has acted most unwisely, and has made the judicious among us to grieve.

Are you yourself acting wisely in supporting him?—Respectfully,

Edwin Lehman Johnson.

Memphis, Tenn., January 16, 1903.

[The Postmaster-General's authority to discontinue post-offices cannot be questioned. Section 3864 of the Revised Statutes fits the case under consideration exactly. When the white "spirit of kindness and good-will" asserts itself at Indianola by stamping out white ruffianism, no doubt the post-office will be reopened. Meanwhile, the example will serve as a deterrent in other localities.—Ed. Nation.]

ONE COMPLEXION FOR ALL "REBELS."

To the Editor of The Nation:

Sir: An officer, writing home to his family from the seat of war, speaks thus of the enemy:

"The people are extremely violent and wrong-headed. Like all other cowards, they are cruel and tyrannical. To hear them talk you would imagine that they would attack us and demolish us every night, and yet, when we appear, they are frightened out of their wits. . . . This is the most beautiful country I ever saw in my life, and if the people were only like it we should do very well. The people here are a set of sly, artful, hypocritical rascals, cruel, and cowards. They have not the least idea of either religion or morality. Nor have they the

least scruples of taking the most solemn oath on any matter that can assist their purpose; the rebels scalped and cut off the ears of the wounded men who fell into their hands."

This sounds very much as if written by an American officer about the Filipinos. But it was not. It was written by Hugh, Earl Percy, a British general engaged in fighting the Yankee "Filipinos" in 1775. More in the same strain can be read in the Percy Letters just published by a Boston house.

We know that Earl Percy was much mistaken in his judgment of us. May we not also suspect the sweeping statements so often made as to the cruelty, treachery, etc., of our foes? D.

CHICAGO, January 17, 1903.

WHITTIER NEWSPAPERS.

TO THE EDITOR OF THE NATION:

SIR: May I ask, through the columns of the *Nation*, whether any one can tell me where I may find files of the *Middlesex Standard* (Lowell, Mass.) for 1844-'45, and of the *Essex Transcript* (Amesbury, Mass.) for 1845-'46? During parts of the years mentioned, J. G. Whittier was the editor of these papers.—Very truly yours,

G. R. CARPENTER.

COLUMBIA UNIVERSITY, NEW YORK CITY, January 16, 1903.

Notes.

Besides the special, luxurious edition of Little, Brown & Co.'s forthcoming "National Edition" of Daniel Webster's speeches and letters, limited to fifty sets, we should have mentioned the regular subscription edition of 1,000 sets in buckram at one-tenth the price of the former. New portraits of Webster, with portraits of all the Presidents and of eminent statesmen contemporary with him, form a part of the profuse illustrations in both series.

The Carnegie Institution has deemed it useful to reëstablish the *Index Medicus*, a monthly classified record of the current medical literature of the world, originally founded by Drs. John S. Billings and Robert Fletcher in 1879, and discontinued twenty years later. The second series commences with January 1, 1903, and will have for editors Dr. Fletcher and Dr. Fielding H. Garrison. Subscriptions should be addressed to the Carnegie Institution at Washington.

The American edition of the quarterly *Book of Bookplates*, edited by Stewart Dick, will hereafter be issued by the A. Wessels Company.

Forthcoming publications by G. P. Putnam's Sons are 'The Life and Times of Georg Joachim Goschen, Publisher and Printer of Leipzig,' by Viscount Goschen, freely illustrated; 'St. Augustine and his Age,' by Joseph McCabe; 'The Egregious English,' by Angus McNeill; and 'The Art of Speaking,' by Ernest Pertwee.

Trial sheets of Houghton, Mifflin & Co.'s edition of Florio's Montaigne in three volumes, folio, show that it will be one of the most beautiful products of the American press. The style of lettering and typographical ornament is, appropriately, that of the sixteenth century in France, but there is no slavish imitation of the methods of Vérard and Tory. The editor, Mr. George B. Ives, has collated carefully the three original editions of Florio, and has annotated the text with a view to explaining difficult passages, correcting mistranslations, and identifying Montaigne's frequent allusions and quotations. In this latter task he has necessarily depended upon the various French commentators, but the notes at hand give evidence of a scholarly and independent spirit. It may safely be said that this stately work will be not only remarkable typographically, but an advance in respect of scholarship upon any previous English edition of Montaigne.

John Lane invites subscriptions to 'The Ancient Halls of the City Guilds,' drawn in lithography by Thomas R. Way, with some account of the history of the companies, by Philip Norman.

'Down the Orinoco,' by Señor Perez Triana, is in the press of Thomas Y. Crowell & Co.

J. B. Lippincott Co. will soon issue 'The Untilled Field,' by George Moore; 'Spinners of Life,' by Vance Thompson; and 'A Tar-Heel Baron,' by Mrs. M. S. Clarke Pelton.

Mrs. Isaac R. Davis, No. 2015 Spruce Street, Philadelphia, contemplates publishing through J. B. Lippincott Co. a quarto volume, 'The Warren, Jackson and Allied Families,' being the ancestry of Jesse Warren and Betsey Jackson.

The season that witnesses a revival of Miss Pardoe's writings fitly brings Grace Aguilar again to the front, if, indeed, she has ever quite "gone out of print." Both these authors, it is instructive to note, owe their endurance in great measure to their excellent style. Dent in London, and the Jewish Publication Society of America in Philadelphia, have just issued 'The Tale of Cedars, and Other Tales,' by Miss Aguilar—the latter drawn from her 'Home Scenes and Heart Studies' of just half a century ago. Walter Jerrold furnishes a biographical sketch containing little not to be found in the Dictionary of National Biography, and there are some illustrations.

Good English can also be predicated of Miss Cummins's novel, 'The Lamplighter,' another half-century success, "in constant demand" since it appeared in 1854 and followed in the wake of 'Uncle Tom's Cabin' as a "record-breaker" in sales and editions. Miss Cummins, as her present publishers, Houghton, Mifflin & Co., inform us, was a pupil of Mrs. Sedgwick in Lenox, but she was also the daughter of a judge, and was naturally endowed with a capacity for literary expression. Her first book is worth reading by any student of changes in the public taste in fiction. It is now presented in unmutilated form.

Thackeray's daughter supplies a tripartite preface to Macmillan's new edition of the perennial classic, 'A Week in a French Country House,' of Adelaide Sartoris, with a photographic portrait, and two illustrations by Lord Leighton. Mrs. Ritchie suggests rather than portrays the charm of the musical sister of Fanny Kemble by fragmentary extracts from letters of personal friends. "One thing," writes one such, "that always rings in my ears"—the phrase is not happily chosen—"is her recitation of Shelley's 'Good Night' to a low obligato accompaniment on the piano." We read also of two of her treasured possessions, "a beautiful old black German Bible, on the first page of which is inscribed, 'F. Liszt to Adelaide Kemble,' " and "a green morocco book beautifully bound, the name written in it by the giver, Edward FitzGerald," which "contained Tennyson's 'Morte d'Arthur' copied out in familiar handwriting." "Mrs. Kemble," FitzGerald's full-moon correspondent, "has told me how," adds Mrs. Ritchie, "as a young man, Mr. FitzGerald deeply loved and admired her sister."

India paper is to be thanked for the reprint of Pepys's immortal Diary in one pocketable volume which Mr. Newnes and the Scribners offer conjointly. If Lord Braybrooke's edition, and not the later and fuller versions, has supplied the text, there is still all that the average Pepysian will require. An imaginary portrait of the diarist, by E. J. Sullivan, is the frontispiece and sole illustration. The impression, in spite of the marvellous compactness of the tall booklet, is large, and clear enough to be read by him who runs or walks. For the latter service this reprint is eminently convenient. There is a two-column index of 66 pages.

To the "Caxton Series" of the same publishers is added a two-volume reprint of Herrick's 'Hesperides and Noble Numbers,' illustrated after pen drawings by R. Savage, and bound in the familiar bright blue flexible leather, gold stamped.

While on the subject of little books, Mr. Henry Frowde's 'Select Passages from Jowett' ('Plato's Introductions' and 'Theological Writings') should not be forgotten. These convenient little volumes contain respectively a portrait of the Master of Balliol at seventy-six and at fifty-four, and are edited by Lewis Campbell. Both are calculated to attract attention to the robust intellect of Jowett, and to do good.

The pretty "Muses Library" (London: Bullen; New York: Scribners) is continued by 'The Poetry of George Wither,' in two volumes, edited by Frank Sidgwick. Of this voluminous writer only the poems, including those in the edition of 1622, are chosen; his later religious writings, which the curious will find in the Spenser Society's reprints, are neglected. Wither could have been popularized on no other terms. The present edition contains portraits, facsimiles, an elaborate introduction, and bibliographies—all in keeping with the scholarly tradition of the series.

Ginn & Co. do a valuable service in printing Charles Sumner's 'Addresses on War' in an inexpensive volume. Neither the eloquence nor the cogency of the three orations—"The True Grandeur of Nations," "The War System of the Commonwealth of Nations," and "The Duel between France and Germany"—has faded with the lapse of time. Indeed, recent events only emphasize the value of this classic refutation of the arguments for militarism.

We close our present enumeration of reprints with mention of 'The Poetical Works of John Keats,' in a single volume (Macmillan). A straightforward biography in brief, with some appreciation of the poems, is supplied by Walter S. Scott, and there is a portrait. The use made of Keats's letters in the introduction may prompt the reader to turn to them in Mr. Forman's edition; but on every occasion there should be an explicit injunction to make a first approach to Keats by way of

these documents, which share the remarkable precocity of his verse.

The Rev. Daniel M. Wilson's 'Where American Independence Began'—*scilicet*, Quincy, Mass.—(Houghton, Mifflin & Co.), is little more than a working over of the memorial volume which he edited a dozen years ago on the occasion of the 250th anniversary of the First Church in that town, of which he was for fourteen years pastor. He has swollen it with pictures, one of them a portrait of very questionable authenticity, and with other matter which have been before the public again and again, and the last pages are a sort of cross between a business directory and a "blue book," with more than one misspelling. Externally, the book is attractive.

Oxford University prescribes the first book of Appian's 'Civil Wars of the Romans' in the Greek text for students in the School of Literæ Humaniores. The selection is made because it embraces a period, between Polybius and Cicero, not covered by any other ancient writer, except in a fragmentary way by Plutarch. Mr. Strachan-Davidson, fellow of Balliol College, has brought out this book with notes and index, and an appendix on the Passage of the Alps by Pompey and Hannibal, the whole embracing 150 pages. The like service rendered by the same editor in his 'Selections from Polybius' is sufficient guarantee of the carefulness of his work on the text of Appian (H. Frowde).

Curtis & Cameron, Boston, publish 'The Quest of the Holy Grail,' the text being paraphrased from the old legends to fit the plates, which are from Mr. Abbey's well-known paintings in the Boston Public Library. Wherever possible, Dr. Greenslet has "followed Malory's diction," and has done his work well enough. The plates from the paintings are too small in scale to be effective, and are unequal in execution, but they are supplemented by eleven reproductions from the original chalk studies which are more satisfactory, though they show a curious effect of red and green striping which is not pleasant. The book is handsomely printed and bound in buckram.

The published volumes of Addresses and Proceedings of the National Educational Association tend to become unwieldy and more or less chaotic. The recently distributed volume, covering the last annual meeting, held at Minneapolis in July, comprises more than 1,000 pages, while the table of contents requires a little over 200 separate entries. It is a rare reader who has interest in more than a fraction of this mass of material; and of those who are interested in it all, few, if any, could find time to read the half of it. It is a pity, then, that really good papers should be buried away so effectually from those who ought to read them. Here is a paper by J. Irving Manatt, for instance, on the "Future of Greek Studies," which is one of the most trenchant, witty, and effective presentations of the subject in brief ever made by an American teacher. There are other good papers on such subjects as "Education in the Appreciation of Art," "The Psychological and Ethical Value of Music," "Hindrance to the Development of Language," etc.; but happy is the reader who will find them in this much and miscellaneously overladen volume. If the National Educational Association is to cover so much and so varied ground in its meetings, we suggest the publication of its papers and proceedings in two or three small volumes, so classified as to consult the convenience of certain general types of possible readers. Papers on language, literature, history, art, and music, for instance, might well go together; mathematics and the natural sciences could form a second volume, and pedagogical discussions a third. The Secretary's minutes should go into a small pamphlet, entirely apart from other material. All this directly in the interests of the cause for which the Association exists.

A granddaughter of Mrs. Sarah Josepha Hale is vindicating through the press that lady's authorship of the familiar poem, "Mary had a little lamb." There was, she says, no Mary and no lamb except in her grandmother's imagination. The poem was composed "at the request of Lowell Mason of Boston, where Mrs. Hale was living, in 1830. Dr. Mason was very desirous of introducing music into the public schools of Boston," as he afterwards did.

—The 'Valley Forge Orderly Book of General George Weedon' (Dodd, Mead & Co.) is a valuable record of one phase of the life of the Continental army in 1777-78. The operations intended to save Philadelphia from capture by the British, the defeat of Washington's plans at a time when the surrender of Burgoyne placed Gates in a position to be used by men more scheming than himself, and the terrible winter at Valley Forge, make a sequence of events of the highest interest. The value of this record lies in its picture of the daily routine of army life, the punishments meted out by courts-martial, the details of the troops, the parole and countersign, and the machinery of marching orders. It is not new, for every army lived in much the same way; yet it is novel in the light thrown upon the events of the years covered by the record. Discipline was maintained at great cost to the wrongdoer, the punishment ranging from a reprimand to death. Plundering was denounced in the strongest terms, and the frequency of mention points to the difficulty of restraining the men. The hopes and fears of Washington are expressed in the orders, either in a stirring appeal to the patriotism of the troops, or a frank admission of failure coupled with soothing phrases intended to take off the sting of defeat. The praise of the victor of Saratoga, the mishap at Germantown, where the Americans "fled from victory," and the dark days in winter encampment, called forth sentences of high eloquence, almost Napoleonic in form and manner of expression.

—The orderly book is printed just as it was written by the adjutant of Weedon's Corps. That is as it should be, but it may be questioned whether that is enough. The general orders of the army are given so far as the orderly used them, and the orders of the brigade, issued by Greene, as well as the division orders, are added. This makes the record the more interesting, but is apt to mislead those who do not know that it is a record of a particular division in a particular brigade of the Continental army. Either through carelessness or intentional omission the orders are incomplete in what should be the principal feature, the orders applying to the whole army. For example, Greene's command marched early on August 22, and lost the orders issued on the afternoon of the 21st, directing the march of the regiments of horse. On the next day, Washington approved twelve sentences imposed by a general court-martial, but only seven of these are recorded in Weedon's book. The movements of the brigade on a march prevented the proper entries in the orderly book, and thus it happens that omissions are frequent. There are printed no general orders for August 24 and 25, though on the latter day was issued notice of the trial and acquittal of "Capt." Henry Lee on a charge of disobeying orders. The words of parole and countersign are often omitted, and "after orders" are not given in the first months of the record. Errors in date are found, as when the orders of August 27th are entered as those of August 28th. The omitted words could easily have been obtained from another record, as on p. 22, where *thing* is the missing word. Names are carelessly printed, though the plea could be made that the original phonetic method was at fault. But when the same name is incorrectly indexed (as Durgie for Durkee), the editor erred. As a whole, the book stands by itself, and it is to be hoped that at some future time the national Government will print the entire general orders of the Continental army.

—In spite of the fact that no one who visits the west of Ireland can resist writing about it, Connemara has been very little affected and still less enriched by the tourist. The inns, with perhaps three exceptions, are very poor, and the district seems likely to remain a centre of sport for such as can afford to rent one of the shooting and fishing lodges that relieve the loneliness of the deep bays and lakes. Mr. S. G. Bayne, in his brief Irish tour from Londonderry to Cork by way of Donegal, Sligo, and Limerick ('On an Irish Jaunting Car through Donegal and Connemara: Harper & Bros.), traversed some of the most interesting and least-visited country in Ireland. The full-page photographs which he collected *en route* are the most attractive feature of the book, which has no pretension to style. It is, in fact, merely a series of notes on car-drives, hotels, and famous points of scenery, written in a genial spirit as a record of a successful holiday. We can imagine no short European trip half so likely to restore a business man as this of Mr. Bayne's, who spent his month's vacation among some of the most beautiful mountain and lake scenery in the world, far from the tourist throng, and in the mild, soothing air that ensures appetite and sleep. It is to be hoped that his experiences will inspire many, but not too many, others to avoid railways and towns, and drive at their ease in an Irish side-car in that lonely country that lies on the extreme western verge of Europe. The western counties of Ireland have all the beauties of Wales in a higher degree; one is rarely out of sight of great stretches of water, fresh and salt, and the sound of it is always in one's ears. The great advantage of these districts over Wales is the absence of crowds—a state of things likely to continue in the present happy scarcity of railways. Mr. Bayne's book is well got up.

—One more book intended to serve as a

guide to what is left of old Paris comes from the house of Hachette, under the title 'Guide Pratique à travers le Vieux Paris,' by the Marquis de Rochegude. It is a small pocket volume of 230 pages, and professes to deal only with the ancient and the curious houses, especially those which can be seen by visitors; and indirectly with the streets, squares, and quays on which these houses open. In thirty-three different routes (*itinéraires*) the inquiring student of Paris is carried from corner to corner—and for a certain distance up adjoining streets—from house to house, with pauses at the old *portes-cochères*, with mention of what few memorial tablets are built into the walls, and some historical fact about many and many a house not so distinguished. Occasionally one is disappointed that an old legend is discredited by this careful investigator, or receives no notice at all, for some legends are of very modern construction, and others will escape the student's notice; but most often a brief sentence or a briefer clause gives all that need be given to set the inquirer on the right path. Thus, one is pleased (page 126) with the beginning of the Thirteenth Route and the first house mentioned in the Rue St. Honoré, which was, it appears, that occupied by Gabrielle d'Estrées in 1594, and that in which Jean Châtel tried to murder Henry IV.; but again one is a little disappointed when he reaches the point of the Island where the Pont Neuf crosses it, and there rise before his mental vision the two old houses which front westward down the river, to find no mention of the legend which another antiquarian has preserved:

"Illec feut Jean Chastel conduict,
Pour estre occiz place de Grève."

The old houses are named—No 13 on the north side, which carried once the sign of St. Jerome; No. 15 on the south side, which was at the sign of the Golden Cup or Vase (*Coupe d'or*); and it is stated that between these houses Tabarin set up his portable platforms and acted his farces—farces decried by Boileau, but spoken of with complacency by La Fontaine. The author of the book before us does not allow himself to take these "barndoor-fowl flights of learning," as Dr. Holmes would have called them; he goes straight on with his task, and tells us of the different buildings with but the briefest allusion to their history and traditions. But this is what one wants in the case of a little index-like book.

—Professor Beljame of the University of Paris has followed up his masterly translations of "Macbeth" (1897) and "Julius Cæsar" (1900) with a version of "Othello" (Paris: Hachette), equally faithful and illuminating. Previous French translators and adapters of Shakspere, from Letourneur (1776) on, have sacrificed fidelity to predilection, and either made him frigidly "classic," transmuting his varied speech into that *style noble* in which "horse" is always *coursier* and "man" *guerrier*, or else made him extravagantly "romantic," overloading his pages with violent epithets and introducing wilful distortions of his sense. Instead of reproducing Shakspere's meaning as they found it, they have given what in their judgment he ought to have written. In the new translation Shakspere comes into his own. Professor Beljame furnishes a critical text, preserving as far as possible the readings of the first folio, but with modernized spelling. The stresses of the verse are marked according to Ellis's system. Facing this is the French version, line for line, in prose. The fidelity of spirit and the scholarly accuracy of the translation call for high praise. While closely literal, it is not a dictionary translation, but one in which idiom is matched by idiom, and in which the speakers preserve individuality of diction. Even the puns of the original meet us in amusing French equivalents, as where "Thereby hangs a tale," becomes "Il y a une queue à l'histoire." Professor Beljame's version can be recommended not only to the student of Shakspere, who will find that it throws constant light upon the difficulties of the English text, but also to the student of French, to whom it offers an admirable opportunity of comparing the usages of the two languages.

—At a convention of the Modern Language Association of America, held at Harvard some years ago, Dr. Daniel K. Dodge, in a paper entitled "Scandinavian Lexicography," pointed out an Etymological Dictionary as the most crying need for Danish linguistics, while an opposing speaker maintained that the chief desideratum was a thesaurus of the Danish language, something like a Danish Webster or Century Dictionary. The former of these needs was partly, but very imperfectly, filled by E. Jessen's 'Danish Etymological Dictionary,' published at the expense of the Carlsberg fund. The author, who in his youth was one of the most promising Danish philologists, a leader in modern philologic thought, keen as a razor, had turned a complete somersault in his linguistic theories and practices, had for a long time given up his interest in philologic research, and now set to work to combat the very linguistic tendencies of which he was formerly a partisan. He, therefore, so to say, wilfully made his work antiquated, and it is not very valuable to the public or to the student. A more ambitious work is now in course of publication by H. Aschehoug & Co., of Christiania, under the title of 'Etymological Dictionary of the Norwegian and Danish Language.' The authors, Hjalmar Falk and Alf Torp, both of whom are professors in the University of Christiania, have for several years been known to philologic science as collaborators, having previously published jointly two works relating to the phonetic and syntactical history of the Dano-Norwegian language. Their intention is, in the present work, to give a scientific explanation of the origin and history of every word, not only in the Norwegian literary language, but also in the pure Danish and in the Norwegian *landsmaal*, and also to explain the origin and meaning of the many idiomatic expressions and popular sayings in which this language, like most others, abounds. Of this dictionary three parts have so far appeared, carrying the work to about the middle of the letter H. It gives every promise of being of great interest to any student of the Scandinavian languages, although it would seem that the authors occasionally take in too much of the etymological material obtained from the more distant branches of the Indo-European family of languages, and are too prone to find an historic connection between German (Low and High) and Danish or Norwegian peculiarities. A Danish or a Dano-Norwegian "Webster" or "Standard" Dictionary still remains to be wished for.

WIENER'S RUSSIAN ANTHOLOGY.

Anthology of Russian Literature from the Earliest Period to the Present Time. By Leo Wiener, Assistant Professor of Slavic Languages at Harvard University. In two parts. Part I.—From the Tenth Century to the Close of the Eighteenth Century. G. P. Putnam's Sons. 8vo, pp. xvii, 447.

For many years, both in England and in America, there has been a genuine popular interest in Russia and its literature, if one may judge by the ready sale of books of travel in Russia, and of translations—often bad ones—of Russian novels. But for information on Russian literature the public has had to depend largely upon scattered essays, often by men insufficiently acquainted either with the Russian language or with literary criticism. Waliszewski's 'History of Russian Literature,' the best general account of the subject accessible in English, has much suggestive discussion of the great modern writers, but is very weak in its treatment of the earlier periods, and its inaccuracy has been increased by an incompetent translator. This "definite want" Professor Wiener of Harvard University has undertaken to supply in his 'Anthology.' Probably no writer of English is so well equipped for the task. His first volume concludes with the close of the pseudo-classic school at the end of the eighteenth century. A second volume will treat the modern or "national" literature.

The plan of the work is excellent. A 'Sketch of Russian Literature' opens the volume. Though this at first seems obscure, from its almost stenographic form and the host of strange names that fill its pages, it proves to be well adapted to its immediate purpose, for in the body of the book we find a selection from nearly every one of these unknown authors and a short account of his life and his position in literary history. In these selections, which are in part here translated for the first time, in part chosen from previous English versions, lies the great value of this 'Anthology.' Professor Wiener has not written a volume of pleasant essays, but has given us a work to some extent authoritative. A diligent student of this book would probably learn more of the earlier Russian literature than he could from all other English accounts put together.

Of course the 'Anthology' is in no sense a work of original research, but a frank compilation. The selections are often translated from Russian chrestomathies, notably from that of Busláev, a text-book used in the Russian schools. These native sources are, very sensibly, not specifically acknowledged; the mention of names would be useless to the English reader and almost superfluous to the student of Russian. On the other hand, abundant references are given to the preceding English literature on the subject. By this modesty of aim, Professor Wiener has secured a unity and proportion for his work that it would have been harder to attain in a more ambitious attempt. His selections illustrate and support one another. Thus, the old epic fragment, 'The Word of Igor's Armament' is explained by an extract from the 'Kiev Chronicle' narrating the same event. Everywhere the effort is to give English readers somewhat the same commonplace, connected, useful notion of the older Russian writers that Rus-

sian boys and girls receive in the gymnasium. Finally, the logical transliteration of Russian names ranks not least among the merits of this 'Anthology.'

Thus, the general plan of the book merits nothing but praise. Before speaking of the execution, we must note that English is not Professor Wiener's native language. In spite of this, his style is in general clear and idiomatic. We will note, however, occasional infelicities of diction which might well be corrected in a second edition. Witness the mixture of metaphors in the following:

"We shall now make the balance-sheet of the eighteenth-century literature in the separate departments, and see what residuum it bequeathed to the nineteenth century" (p. 33).

In the following there is a peculiar incongruity:

"I picked up a psalter in my sorrow, opened it, and these words were before me: 'Why are you sad, my soul? Why are you grieved?'" (p. 51).

Here the English reader longs for the familiar phrases of the Authorized Version. Occasional mistakes are to the discredit of the proof-reader. Thus, we read of "a drunk man" and "a drunk woman" (p. 129).

In his Preface, Professor Wiener writes:

"In my own translations . . . I have attempted to render minutely the originals, with their different styles, not excepting their very imperfections, such as characterize particularly the writers of the eighteenth century. Only when the diction is inexpressibly crude, as in Pososhkóv's writings, or the text corrupt, as in the 'Word of Igor's Armament,' have I made slight deviations for the sake of clearness" (p. vi).

This effort at extreme literalness seems to have been unfortunate in the very title here mentioned. "The Tale of Igor's Raid" would, we think, be far better. Apparently, the English "word," unlike its Russian equivalent, has never been used in the sense of 'tale' or 'story.' And, striving to render the ambiguous Russian *polk* ('expedition' or 'band'), the translator selects "armament," thereby producing a bookish title quite at variance with the tone of the old heroic tale.

In other cases, Professor Wiener seems not to have adhered to his plan of literal translation, sometimes even to have fallen into positive errors. We have compared with the originals only a small portion of the 'Anthology,' and that mainly from the older, more difficult texts. Now Russian mediæval documents are in one respect much like their Western contemporaries. The general sense of their naïve, incoherent narrative can be made out at a glance, but a strictly accurate version requires time and painstaking attention. Over some passages Professor Wiener seems to have passed too lightly. Thus, we read: "Then Prince Igor stepped into the golden stirrup and galloped over the clear field. The sun barred his way in darkness; night groaning with the cries of birds awoke him" (p. 83, 'Word of Igor's Armament'). If Igor were galloping on horseback, he would scarcely need awakening! In this passage the text is apparently not corrupt and the sense seems clear: "Then Prince Igor stepped into the golden stirrup and rode over the clear field. The sun barred his way with darkness; night, groaning threateningly at him, awoke the birds." In the same 'Word of Igor's Armament,' by the way, on page 94, figures a certain Ovlúr, whose relation to the story is not explained. A short footnote would have served to point out his probable identity with the Lavór of the 'Kiev Chronicle' (p. 78). The 'Story of Misery Luckless-Plight' appears in the 'Anthology' as a prose tale, with no hint that the original is in a rude form of verse, imitated from the popular ballads. It is also omitted from mention in the index to the volume.

Professor Wiener's critical views owe much, he tells us (p. vi.), to the Russian critic Pýpin, whose great 'History of Russian Literature' is the most recent general work on the subject. For the most part, Professor Wiener's criticisms are guarded, and of a general character, but here, also, occasional doubtful statements may be noted. No document of early Russian literature is so interesting as the oft-mentioned 'Word of Igor's Armament,' an epic fragment dating apparently from the twelfth century. No document is so problematic in its literary character and relations. By making the first complete English translation of it, Professor Wiener has rendered a great service; but he is surely wrong in writing: "The *Nibelungenlied* and the *Chanson de Roland* are chiefly productions of a literary character, while the *Word* bears every evidence of representing the untutored labor of a popular bard" (p. 80). Here he goes much further than Pýpin, who says merely (in our abridgment):

"As the work of a personal author, the *Word* is a remarkable proof of the degree of literary cultivation reached by the twelfth century. In it coöperated elements of folklore, of personal temperament, and of old traditions. It may be compared to the *Nibelungenlied* and the *Chanson de Roland*, but did not undergo literary remodelling to the same extent, and has preserved surprising and, historically, extremely curious traits of popular poetry and popular manners."

Furthermore, the 'Word,' in its present form, is written in a sort of poetic prose, reminding us of Ossian. Professor Wiener refers to it constantly as a "poem," and to its author as a "bard"; only once (p. 9) does he use the term "prose poem." But at least one prominent Russian scholar held that the 'Word' was never written in verse at all, and that its frequent references to pagan divinities, instead of being direct echoes of popular superstition, are ornaments of a pseudo-classic character.

As a whole, this 'Anthology' will hardly make Russian literature more popular. In particular, few readers will be attracted to the eighteenth-century poets. Even in Russia most of these men are as little read as Glover in England or Trumbull in America. Professor Wiener's treatment of the folklore is good, but here he has had competent predecessors. The earlier pages of the volume, with their versions of quaint mediæval pieces, hitherto wholly inaccessible, are the most valuable; but even these translations will appeal to a very limited public. The 'Anthology' will be most useful to those who already know something of the great modern novelists, and who wish to extend their knowledge to the earlier literature. To them it will be indispensable. It should stand on the reference shelves of every public library. It appears auspiciously by the side of new and at last, let us be thankful, competent versions of Turgeneff and Tolstoy. We may hope, then, that in our new century the knowledge of Russian literature accessible to English readers will be knowledge worth having.

HALE'S MEMORIES.

Memories of a Hundred Years. By Edward Everett Hale. Two vols. The Macmillan Co.

In the course of these wayward and intricate meanderings Dr. Hale mentions a well-known French physicist — so well known that he is not named—who remembered seeing the nurse raise the curtain of his room when he was six hours old. But Dr. Hale's own memory goes farther back. It is only through excess of modesty that he calls his book 'Memories of a Hundred Years.' A century does not exhaust their scope. His explanation of his title is that he remembers people who remembered the beginnings of the nineteenth century. He remembers some whose memories go back a good deal farther, and he remembers books that take him back another stretch of quite indefinite extent. Here is a device the working of which has no assignable limit, and it would not be strange if some ingenious writer should better Dr. Hale's instruction and publish his 'Memories of a Thousand Years.' It should be said, however, that Dr. Hale does not overrate the charm of oral tradition, and no parts of his book are more engaging than those which take hold upon the memories of those who were already old when he was young.

For the best appreciation of these 'Memories' it is above all things necessary that they should not be taken too seriously. They yield no definite information. To go to them for careful judgments upon men and events would be absurd. But, take them for what they are—the slap-dash reminiscences of an octogenarian of imperfect memory, of violent prejudices and excursive fancy—and they provide a fund of entertainment which only the improvident will neglect. It should be borne in mind that Dr. Hale has done more in fiction than in history, that his preference for the former is pronounced, and that he is never happier than when "submitting the shows of things to the desires of the mind." He has several convenient formulæ, "I think" and "I believe," etc., by which we are warned that he is embroidering the fact to suit his fancy; but his proclivity to imaginative writing is much too insuperable for him to be invariably conscious of its effect. There is a good deal of exaggeration which can hardly claim the license of the poet, as where he protests that he must have seen Webster thousands of times and read thousands of his private letters, where "scores" would probably be an exacter indication. A less venial fault is the sheer dogmatism of certain pronouncements, as that Webster was a greater man than Burke, and the intrusion of a bitter partisan note. Meantime there is no feature of the book that is more amusing than its excursive manner. The backward movement of 'Tristram Shandy' did not begin to be so comical as these flittings back and forth and in every possible and unlooked-for direction.

Much of the first volume is occupied with things that happened before Dr. Hale was born, and nothing could take us back to the fore part of the nineteenth century

more vividly or painfully than the temper in which Thomas Jefferson is assailed. To know how the Federalists hated Jefferson in 1801, and to understand the spirit in which James Cheetham and other pamphleteers and journalists of that time carried on their political controversies, one could not do better than to read the depreciation of Jefferson that we have here. The novelty of the accusation is that it reduces Jefferson to a mere nonentity, which is not by any means the doctrine of Mr. Henry Adams, to whose 'History' Dr. Hale many times refers as confirmatory of his own opinion of Jefferson and "the Jefferson dynasty." Madison is always "poor Madison," while Monroe is treated with more absolute contempt, not even the Monroe Doctrine saving him. In his chapter on the historians, Dr. Hale has high praise for Bancroft, but if the two should ever meet in the Elysian Fields, and Bancroft has then read any translation of this book into the language of that country, Dr. Hale may expect as bad a quarter of an hour as Tartarus could afford.

There is a hint of personal grievance in Dr. Hale's treatment of Jefferson. We are assured that Jefferson treated Philip Nolan shabbily. But then Jefferson had not read 'The Man without a Country,' and could not be expected to have the interest in Philip Nolan felt by the author of that brilliant story. For clearly Dr. Hale's interest in the real Philip Nolan, a Western filibuster and horse-thief, is merely the reflection of his interest in the imaginary Philip Nolan of his story. It seems that he did not mean to name his inverted hero for an actual person, imagining that the real Nolan's name was Stephen. The name Philip was suggested to him by the mistake of an Episcopal rector who said St. Philip when he should have said St. Stephen. The real Philip Nolan was shot and killed on one of his horse-stealing raids into Texas, and his companions who were captured were severely punished. Hence, we are told, hatred of Spain in the Southwestern region, the annexation of Texas, the Mexican war, the Southern enthusiasm for the late Spanish-American war, and so on. It is all very amusing. Jefferson is bitterly reproached for not vindicating the cause of Philip Nolan, the unwitting namesake of Dr. Hale's man without a country. Dr. Hale would have Texas erect a statue to the real Nolan, and he would have another statue to him in the Washington gallery of heroes. Yet Dr. Hale confesses that he was hand in glove with Gen. Wilkinson, in whom he recognizes as complete a scoundrel as Aaron Burr or Benedict Arnold or Charles Lee.

The material development of the United States has an immense fascination for Dr. Hale, and he cannot say enough in praise of Eli Whitney's cotton-gin and the canals and railroads that have aided this development. There are few feathers in his father's cap that he prizes more than his function as promoter of the Boston and Worcester Railroad, and purchaser of its first locomotive. The filial piety which has this illustration has many another. One would not have it less, nor the loyalty to his uncle, Edward Everett, however we may question the representation of Everett's oratory as peculiarly spontaneous. We are promised much about the brother, Alexander H. Everett, but get very little. We get much more about Daniel Webster, first and last. Dr. Hale thinks his father had known him at Exeter, where Nathan Hale was an instructor from 1805 to 1808, and Webster was a pupil for nine months in 1793. There is no apt conjunction here, but of course Webster might have driven over to Exeter from Boscawen or Portsmouth. Much uncertainty is evinced as to the date of Webster's settlement in Boston, but 1816, the actual year, preponderates. Dr. Hale also thinks that his father sometimes taught in Ezekiel Webster's Boston school when Ezekiel was not well. But Ezekiel's school-keeping ended in 1807 and Nathan Hale came to Boston in 1808. The date of Webster's Faneuil Hall speech defending his adhesion to Tyler is given as 1841. It came off September 30, 1842. It is written of 1844, when Dr. Hale saw Webster in Washington, "He was then Secretary of State." He had ceased to be in May, 1843. "In 1830 I saw Jackson, who came to Boston as President"; but the visit was in 1833. Jared Sparks is called a Vermont boy; but he was a native of Connecticut. There are probably dozens of like mistakes in Dr. Hale's book, the most amazing being the transfer of the Boston *Liberator* to Baltimore. He closes his Webster passage with a brave defence of Webster's temperance, but he makes no reference to his careful use of money and the nice payment of his debts. It is a gross exaggeration of the popular impression to represent it as being that Webster "was often, not to say generally, overcome with liquor in the latter years of his life." The popular impression is that he used liquor freely, and was sometimes the worse for it on great public occasions, and this impression is certainly correct.

From Webster and the orators Dr. Hale passes to the American historians, and the characterization is so genial that we wonder who are the historians on whom Dr. Hale rains the punishing force of his unqualified contempt in many casual references to historical writing. John Fiske would flame indignantly at his lumping of Gibbon with Hume and Smollett and Mitford, as well he might. The Parkman section is illumined by a noble sonnet to Parkman by Dr. Hale's son, Robert Beverly Hale, who, full of promise, died untimely. From the historians we pass to anti-slavery matters, and Dr. Hale is nowhere more interesting than here, especially after he is through with his book-learning and comes down to the *pars magna fui*, of which he makes no vain or inconsiderable boast. It is a very interesting fact that, immediately after the annexation of Texas, he wrote a pamphlet, 'How to Conquer Texas Before Texas Conquers Us.' The idea was that the free North should colonize the State. Here, though Benjamin Lundy was his forerunner, was good preparation for Dr. Hale's efficient alliance, ten years later, with Eli Thayer in his Emigrant Aid Society. Of that alliance Dr. Hale's account is extremely interesting. He thinks John Brown, "for whom he has a high respect," was of great injury to Kansas. This is less strange than his thinking that Thayer and Robinson have been depreciated in the interest of other spirits active in the Kansas struggle. They certainly did not depreciate themselves, except by the extravagance of their over-estimation. Each wrote his "Alone in Kansas"; Thayer, convinced that he was a bigger man than any other who was engaged in the anti-slavery enterprise or than all the rest together. Had they been less greedy of repute, they would have deserved, and would have had, an ampler fame. There was enough for all concerned.

The war chapters are good, and Dr. Hale's list of texts for his war-sermons is a sensible addition to the curiosities of pulpit literature. The story of his "First and Last Battle" is too good not to be true, but here and there a miserable doubt intrudes.

The memories of Boston literary men add little to what we had already. In the first paragraph on Emerson, his 'Representative Men' is apparently confounded with Carlyle's 'Heroes and Hero Worship'; the former having no essay on Mahomet. Dr. Hale's account of Emerson's persistent advocacy of college prayers is that of a surprising paradox. The account of Longfellow's Harvard teaching confirms Col. Higginson's recent testimony to its companionable manner. Dr. Hale used to tell Holmes that he was the first schoolboy to recite his "Old Ironsides." He probably did better then than now, when in four lines quoted he has "tattered" for "threadbare" and "battle" for "lightning."

When all is said, the prosperity of the book is in the personality of the writer, which saturates its every page, a personality which, having the defects of its qualities, is as interesting as it is unique.

Players and Plays of the Last Quarter Century. By Lewis C. Strang. Boston: L. C. Page & Co. 1903.

The most obvious remark concerning this latest addition to the already abundant crop of modern theatrical essays—biographical, anecdotical, and critical—is that it is a more than commonly flagrant instance of book-making. Mr. Strang starts out with the axiom that it is impossible to write intelligently of the theatre of today without a preliminary description of that of yesterday, and he makes this an excuse for filling up a large proportion of his six hundred pages with old and irrelevant matter concerning the actors and plays of the latter part of the eighteenth and the earlier half of the nineteenth century. About these he has no new facts to relate, while his personal comment is, necessarily, of the smallest possible value. Nor can it be said that these digressions enable him to arrive at any particularly novel or illuminating conclusions. He holds that the theatre reflects accurately the national sentiment and aspirations—a proposition somewhat trite as regards the old days when it was the chief, if not the only, means of popular expression, but true in only a very limited degree, if at all, in this era, when every passing phase of opinion or feeling finds instant vent in the daily press. To prove his point, Mr. Strang cites the so-called patriotic plays of the Spanish War period, speculative essays of cheap-Jack managers, of which the very names were unknown to the general community, and to which, by no stretch of the imagination, could any historical or sociological significance be attached. The fact is, that in its present estate the stage is dominated—there are exceptions to every rule—by

the commercial instincts of the syndicates which own it, and prescribe the fashions for it in exactly the same way as the tailors and milliners decide what mankind shall wear. Moreover, Mr. Strang confutes his own theory. He says that there is no demand for the old tragedy, and yet dilates upon the fact that wherever Shakspere is represented adequately, the public flock to the performances.

Mr. Strang says that his book is a "critical review of existing conditions," but sharp exceptions will be taken to many of his critical dicta. He has, for instance, some queer notions on the subject of tragedy. He seems to think that blood-letting was the essential element in the old tragic plays, and the main secret of their former popularity. This might be true of the melodrama of a hundred years back, in which the broadsword combats played so prominent a part. That was already dying when Dickens wrote of Vincent Crummles. Mr. Strang attributes our ancestors' love of tragedy to the materiality of the age in which they existed. Man is now inspired, he thinks, with the spirit of optimism, and he foresees a tragedy of the future which will "breathe sweetness, tenderness, loveliness, and purity," and which, "instead of shocking by its horror, will inspire by its inherent optimism." In what respect this drama is to be tragic he does not explain.

His volumes would be more valuable if confined to matters of which he had some personal knowledge, or if he had been more careful to make it plain whether the opinion set down is his own or somebody else's. His summary of Forrest's career and capacity is a fairly judicious extract from contemporary testimony, but has no independent significance, while no one familiar with Charlotte Cushman's *Meg Merrilies* would have dismissed it curtly as a melodramatic monstrosity. The part itself was a very feeble reflection of Scott's vivid creation, but Miss Cushman's performance of it was a masterpiece of stirring and imaginative acting. As to other actresses succeeding in the character, nobody ever approached Miss Cushman in it, not even Janauschek. Mary Anderson, who possessed the physical characteristics of height and voice in an eminent degree, failed in it absolutely. Again, in speaking of Lawrence Barrett, Mr. Strang remarks that his influence upon the American stage was almost equal to that of Edwin Booth. Now, if there is one thing certain about Edwin Booth, it is that he exercised no influence upon the American stage at all. He won great fame and fortune for himself—nothing more. He trained no actors, encouraged no playwright, avoided all experiment, and for many years was utterly heedless of his artistic surroundings. Barrett, on the other hand, was an ambitious and enterprising reformer, encouraged native talent, revived the poetic drama, and helped to make some good actors. In another place, the author speaks of the genius of Booth encompassing the "brutal animalism" of Othello, whereas the avoidance of anything like this animalism was the salient characteristic (some thought the salient weakness) of Mr. Booth's Moor.

There is much truth in what Mr. Strang has to say about the limited artistic achievement of Mr. Joseph Jefferson, but few persons, outside of Boston, will agree with his comparative estimates of William Warren and John Gilbert. Although the two men had many parts in common, they did not belong to exactly the same class of actors. Warren shone most in low or eccentric comedy, and undoubtedly covered a wider range of character with rare versatility, whereas Gilbert was essentially a high comedian, with capacities for tragic work which Warren could never have attempted. It was only after he had passed the prime of life that he became so closely identified with the three or four characters —*Old Dornton, Sir Peter, Sir Anthony*, etc. —with which his fame is now chiefly associated. Mr. Strang detects the weakness of Augustin Daly as a manager when he says that "to gratify his own idea he was ruthless in his treatment of the text of great English plays, and was so lavish with his pageantry that many of his productions were marvels of misconceived and misapplied effort." This is undeniable, but he was for many years the only real theatrical manager, in the full sense of the term, in the United States, and he has left no successor.

Few persons, nowadays, will quarrel with Mr. Strang's description of the Harrigan plays (in which some critics discerned an almost divine inspiration) as noisy, coarse, and vulgar. Some of the eulogies written about them would make curious reading to-day, but not more so, perhaps, than the extravagant praise of third-rate plays and players of the present period will afford twenty-five years hence. But surely some mention, if only as a matter of record, ought to have been made of Mr. Hart, who contributed very largely to the success of the tenement-house drama. But then, in his account of the great English actors of the nineteenth century, Mr. Strang does not even mention Samuel Phelps, who did more to popularize the legitimate drama than any man of his time. He was, probably, so far as solid achievement is concerned, the greatest actor-manager who ever lived.

Mr. Strang's review of the work of modern authors, William Young, Bronson Howard, William Gillette, Augustus Thomas, James A. Herne, Clyde Fitch, and others, does not evince much judgment or sense of proportion. It is sufficient, perhaps, to state that he accounts "Shenandoah" the best of Mr. Howard's pieces. Undoubtedly it was one of the most remunerative, but there was better work in "Aristocracy," "The Banker's Daughter," "Old Love Letters," and "Young Mrs. Winthrop." Space will permit no more than a passing reference to the author's dissertations upon various modern "stars," the emotional drama, etc., most of which are more fluent than sound; but it may be as well to say that the objection taken by some of Mr. Pinero's critics to his recent problem plays is not on account of any intrinsic immorality in such teaching as they may be supposed to enforce, but because in effect they are sensational presentations of morbid, unclean, and infectious matter, which in a theatre must do more harm than good. Moreover, their potency consists not in their truth to nature, but in their brilliant theatrical treatment. Mr. Strang is confident that there is a great and pressing demand for the American play which presently will be met, in accordance with the general law, and that straightway the theatre will rise Phœnixlike from its ashes, free itself from the superincumbent mass of foulness and stupidity, and put on new literary and artistic glories. It is difficult to see upon what he builds his expectations. American drama is plentiful, but it is not improving sensibly, and there is apparently little hope of salvation in that direction. Intelligent management and good stock companies for the raising of a body of sound actors are the essential preliminaries of revival.

L'Histoire par les Monnaies: Essais de Numismatique Ancienne. Par Théodore Reinach. Paris: Ernest Leroux. 1902. Pp. iv., 272.

Guide to the Catharine Page Perkins Collection of Greek and Roman Coins. (Museum of Fine Arts, Boston.) Houghton, Mifflin & Co. 1902. Pp. viii., 112.

When Huxley coupled numismatics with theology, it was less to exalt the one than to depress the other, with a glance at the supposed antiquarian character of both. Whatever the decadence of dogma, old coins still find less favor than old doctrines, and the ordinary collector is as far from the real numismatist as the average pewholder from the higher critic. Fifty years ago, boys gathered cents of the various dates, and "Jersey horseheads"; to-day, their elders collate the products of our home mints, but look askance on those of former ages. The Roman imperial series, being at once the easiest to understand and the most historically important, might be expected to attract; but, to the man in the street, Augustus and the Antonines "are dead." His antithesis is the archæologist, who turns from the familiar to regions untilled, or where at least something is to be gleaned after the reapers. The Roman field is practically exhausted; what remains but to determine as to a score or two of doubtful issues, and add a possible few types to the twenty-odd thousand described and even valued (as to rarity) by Cohen?

But there was a race older and in a way greater than the Roman; one that in its decadence continued to rule the world, and has no less than its successors to say to modern ideas and institutions. The Greeks had no centralization; human heads, except of monarchs after Alexander, never appeared on their money; "coins were regarded as the badge of freedom," and each town might issue them, under no rule but that of its own artistic instinct. Hence the Greek coinage is as various, complicated, and in the main obscure, as that of Rome is uniform and obvious. In 1854 Colonel Leake estimated that at least a thousand cities and three hundred "tyrants" had issued coins, "some of them in hundreds of varieties"; and subsequent excavations and studies have added to this throng of sources. "The number of types," says the Boston Museum handbook, "is legion." Mr. Head of the British Museum, in his 'Historia Numorum,' the largest and best English book on this subject, disclaims any attempt at exhaustiveness, and passes lightly over the copper or bronze issues, naturally the most numerous and various everywhere. Anything like a complete list of Greek mint-issues is impossible as yet; indeed, to be final, it would have to wait till most of the soil of southern Europe, southwestern Asia, and northern Africa had been thoroughly spaded and

sifted, and the results long and laboriously pored over by more than one or two devotees—for the coins as found are mostly small and hard to decipher, both from imperfect lettering and from their experiences above and under ground. Researches and editing once worthily accomplished, a millionaire or a government might be needed to bear the expense of publishing a work greater than King Victor's forthcoming volume (or volumes) describing all the coins of Italy, mediæval and modern.

But to enthusiasm nothing is impossible. To numismatists of the thirty-third degree "ancient" means Greek; this is implied in the title of M. Reinach's treatise, as in that of Mr. Head before him. The Romans were comparatively modern; everything has been said as to their mintages, which may now be left to children and everyday collectors. Greece—which in this sense extends from the Caspian to the Atlantic, and from 700 B. C. to our era—is the one field for research. The last century, says M. Reinach, has witnessed the beginning of a *Corpus numorum veterum*, which the present age may "perhaps" see completed. As a contribution thereto, he and M. Ernest Babelon have already in press a 'Catalogue général des Monnaies grecques de l'Asie Mineure,' geographically the largest and numismatically among the most crowded sections of the Greek world. These scholars would be the first to point out that such a list can be only "to date," since a coin which is unique to-day may be one of a family to-morrow, and any "find" may modify an established classification or overturn a theory which has passed for fact. Numismatics advances mainly bit by bit, here a little and there a little, through French essays like M. Reinach's and British Museum publications, each touching usually but one corner of a large land; and a descriptive catalogue of all the coins of Asia Minor will be no small addition to our knowledge.

Yet M. Reinach regards this sort of work as merely preliminary: to study coins simply for themselves is to be of the lower class. He distinguishes between pure and applied numismatics. The former describes, classifies, and explains coins; the other, he says, utilizes them, with other means, to resolve questions raised by "l'histoire politique, économique, artistique, religieuse de l'antiquité." Mr. Head and other postgraduates are of the same mind; and the 'Guide to the Perkins Collection' is more explicit: "Greek coins are important for the help they afford in tracing the political, municipal, and commercial history of the ancient world; they also throw light on Greek society, religion, mythology, philology, iconography, chronology, and geography; and they have been termed 'the grammar of Greek art.'" To make them serve some of these uses seems always M. Reinach's object, whether he is discussing the relative values of ancient gold and silver, or the Delphic monetary system, or the dynasty of Commagene, or such obscure topics as the Derrones (known only by a few coins), or a monetary crisis in the third century of our era, or "une monnaie hybride des insurrections juives." That last is an attractive theme, though it affords but a bare five pages.

The Perkins Collection in the Boston Museum is rather a selection, for it claims but 609 pieces, among which Rome is scantily represented by five of the Republic and twenty-five of the Empire; the rest are Greek. Roman coins are mostly inexpensive, and certainly of high historic value; but the idea of art has ruled here. Of Greek alone a collection ten times as large could be gathered for the probable cost of this; but the 579 were chosen chiefly for condition and presumably for typical character. Fifty-seven of them have been photographed, and are here presented on a black ground in five plates, with an effect of most uncommon clearness, strength, and beauty. One, probably of these (we are not told which), brought more than $1,500 at a London sale, and another over $900: these might be moderate prices for books or stamps, but are infrequent with coins, even the rarest and finest. The text of this Handbook reflects no little credit on its too modest author, who withholds his name and disclaims originality, but cannot conceal his mental calibre and attainments. From his brief introduction the average collector or the uninstructed reader may gain more information as to the genesis of coinage, and in a clearer form, than he will easily find elsewhere. Altogether the booklet is most creditable to the Museum, and a contribution (as it is intended to be) both to art education and to the neglected study of numismatics.

A Life of Mr. Yukichi Fukuzawa. By A. Miyamori. Tokio: Z. P. Maruya & Co.

Rarely in any age or nation has it been given to one man so to change the mental outlook of his country as did Fukuzawa that of Japan (1834-1901). As teacher, editor, author, he became the intellectual father of half the thinking men of Japan in this generation. The copies of his printed books ran into the millions. Refusing the sword or office, titles or decorations, absolutely honest and fearless, he toiled as the soldier of culture and righteousness to transform a nation. Stepping down out of the ranks of the gentry, his life was spent in lifting up the masses. He was the liberator of his people from Confucianism and other Chinese cramping notions, and from insular narrowness and bigotry. He led the Japanese into the intellectual freedom of the West. He was the exalter of woman. He cared little or nothing for dogma: his one idea was to know truth according to reason. His ethics were summed up in "independence and self-respect." For forty years the "Great Commoner" wrought in the same field with Okubo, Saigo, Ito, and Shibusawa, as well as with Hepburn, Brown, Verbeck, and Greene, to make and keep Japan one of the nations in the van of progress.

This little book of less than two hundred pages, by Professor Miyamori, its English révised by Prof. E. H. Vickers of the college founded by the master, is based on Fukuzawa's autobiography. It tells of the early struggles of the half-orphan lad to learn Dutch when European books were excessively rare and had to be copied by hand with the pen. When Yokohama was opened, the poor fellow found that, with all his Dutch, he could not read the signs or labels, for they were in English. Happily, he was able to take a voyage to America in the first Japanese steamer which the once hermits navigated across the Pacific within seven years after they had first seen coal-smoke from a ship's funnel. Afterwards he visited Europe, and again the United States. His book on Western Countries, read by all classes, was like the building of a great window in the dead wall of the national intellect. Yet for years Fukuzawa had to live amid assassins who hated "evil opinions." Often he was in the very jaws of death. Seeing how eagerly the soldier and the office-seeker sought to ply their trades—in each case with blunting of the moral sense—he resolved to avoid both battle and boodle. He consecrated himself to the idea that "the independence of a nation consists in the independent spirit of the individuals composing it." In a word, he struck at the core of the Confucian social system. On the day of the great battle at Uyeno, in Tokio, within sound of the cannon, he began the teaching of Wayland's 'Moral Science'—the books having arrived that day. He foretold the rush for office, by both fighting parties, as soon as war was over. The Keio College which he founded (named after the chronological period, 1865-1867), ever a formidable and inspiring rival of the Imperial University, has now over 1,700 students. The *Jiji Shimpo*, which he began and for years edited, is, among its contemporaries, what the two or three greatest journals are in the English-speaking world. "To elevate the character of all the Japanese, to make them worthy of the name of a civilized nation, . . . to encourage the spread of Buddhism or Christianity, . . . to help scholars in their study of profound theories," as the closing sentences of the twenty-fourth edition of his autobiography declare, were the objects of his life. His last work was an utterly destructive analysis of the Confucian principles underlying Kaibara's 'Great Learning for Women'—the standard in old Japan for the training or, rather, the subjection of women. It was written after his years of constructive teaching in journal, book, and lecture, in which he assaulted sensualism and polygamy, and pleaded for the education and uplift of woman as man's companion. His death was mourned by all, from Emperor to laborer, and ten thousand people walked behind his bier.

This little biography is a model in its way. It is terse, luminous, and rich in facts, besides being suggestive and valuable for that kind of history which deals with internal forces, none the less potent because imponderable and immeasurable. The reviewer can not agree with Professor Miyamori when he asserts that "Mr. Fukuzawa introduced this art [of public speaking] into Japan," for he was himself a member of the same club in Tokio named Meirokusha (p. 79) to which Fukuzawa belonged, and often talked with and heard the man who first found or coined Japanese words for "speech," "debate," "second," etc. Nevertheless, he knows how thoroughly the American teachers and missionaries had, even before Fukuzawa's beginning, trained their pupils and converts in the forms or Western deliberative assemblages. For Robert H. Bryan (p. 54) R. H. Pruyn should be read, and one or two of the Dutch names need reconstruction. This little book ought to be in our public libraries.

The Cathedrals of Great Britain, their History and Architecture. By P. H. Ditchfield, M.A., F.S.A., Fellow of the Royal Historical Society, Rector of Barkham. With numerous illustrations by Herbert Railton, J. A. Symington, H. M. James, H. Cricqmore, etc. London: J. M. Dent & Co.; Philadelphia: J. B. Lippincott Co. 1902. 8vo, pp. xii., 452.

It is not surprising that the supply remains constant of books devoted to the English cathedrals. To those persons who are immediately interested in them, or in one of them, no other earthly subject is quite as important: and to such persons there is also the pleasant assurance that many travellers, especially the English-reading Americans, come every year to visit those shrines of pilgrimage, and that a large minority of them will buy the books. The volume now under consideration is a small octavo, and can be carried in the pocket of a working overcoat, or more easily in a hand-bag along with an opera-glass and the like. It deals with all the cathedrals in Great Britain; and to this it adds a consideration of Westminster Abbey and Beverley Minster. All are mediæval buildings except St. Paul's in London; and as St. Paul's is the only example of its class, its history is set forth in twenty-five pages with a number of text-illustrations, while no other building except Ely Cathedral has as many, even Westminster Abbey, with its immensely interesting display of monuments, falling short by a page or two. To Newcastle only two-thirds of a page is given. Iona, Brechin, Aberdeen, Dunblane, Dunkeld, St. Andrew's, Kirkwall, and St. Giles's Church at Edinburgh are also put off each with a page of text more or less, and no illustrations at all. And this seems disproportionate, because, while their artistic interest may be less, their historical record is as important as if they were as splendid as Canterbury.

Concerning the value of the work, it can only be said that the author seems to have endeavored to do his duty as a guide. He has drawn on authorities of all sorts, and mentions their names in his preface —church officers of many ecclesiastical establishments in England, and the architectural writers from Rickman to Prior, covering some three-quarters of a century of *quasi*-archæological research. The book is not elegantly written; nor is perfect accuracy in description or in definition to be found in it. The word pilaster is defined in two or three insignificant ways; for instance, in the note on page 27, nearly followed in the "Glossary," it is said to be "a column attached to a wall." The odd statement on page 145 that "the vaulting is what is known as lierne" would throw an untrained visitor into great embarrassment, more especially as lierne is not given in the glossary. We are asked to feel a sad interest in the burial of Mary Queen of Scots at Peterborough, and to think of "the twilight procession bearing the executed body of the frail but fair queen." There are also some odd bits of history furnished, as when we are told that "in 1642 Cromwell's soldiers, under the Earl of Essex, entered the town [Worcester] and did after their kind," where there is evidently confusion between Cromwell and the Parliament—"the Houses." The index is merely a one-page list of towns and buildings with which the book is chiefly concerned; and the glossary, already named, occupies two pages only, and is, of course, extremely inadequate.

Animals before Man in North America: Their Lives and Times. By Frederic A. Lucas. D. Appleton & Co. 8vo, pp. 298. Illustrated.

Mr. Lucas is a very entertaining writer. He popularizes his science so that the technicalities are unobjectionable to any class of readers, and do not make the science appear to suffer by their lack of prominence. The story he tells relates in the greater part to vertebrates; it is that of the periods in their history sketched from the more patent features of well-marked epochs, with something about the forms of the creatures, their kindred affinities, migrations, localities of discovery, etc. The narrative, as a whole, is decidedly interesting and is well rounded. The conclusions as to relations of the extinct types and the causes of their disappearance are probably as good as any; but our liking for the work does not carry with it agreement with quite all that is said.

On page 114, in the quoted remarks concerning a batrachian of the lower coal measures, the footprints are described as "hand-like, that of the fore foot five-fingered and four inches broad; that of the hind foot somewhat smaller and four-fingered," which reverses the conditions generally present on these animals as to toes and feet, and recalls the noted saurian which at one time, in the hands of an eminent palæontologist, wore its atlas on the end of its tail. The dentition of sharks, page 105, calls out the statement that "only one of the many rows of teeth is in use at one time, the others forming a reserve supply, to be drawn upon in case of accident, and, like reserves of soldiers, these are kept at the rear and lie down out of the way." This does not give a very fair idea of the matter, for the growth of teeth is continuous, new rows forming at the rear, and old ones shelling off at the front, accident or no.

Looking for our author's accepted theory of origins, one finds him to be facing in several ways. On page 91 he says protective resemblances "have been brought about, so it is believed, by elimination, by the weeding out of the more defenceless, so that the process is passive, not active"; and on page 104, "protective resemblances could hardly have originated by any other process than that of a slow weeding out of the more conspicuous individuals." By a weeding out of the unregenerate one might as well account for the different religious denominations. The author limits himself to weeding out for protection. On page 275, in accounting for evolution, he places himself on safer ground (somewhat familiar to our readers during the last twenty years), and here relies on "an inborn tendency in living things, both plants and animals, to vary and to adapt themselves to circumstances." He further says: "Changes in their surroundings—and these are ever taking place—simply allow this natural tendency a chance to act." Instead of "allow," he would better use a word like induce, stimulate, or impel. He might account for protective resemblances by an innate tendency in variation encouraged and guided by circumstances. In regard to the extinction of so many forms, Mr. Lucas concludes that "there seems to be an old age in the life of species as well as in the life of individuals, when a species, a family, or an order even, comes to an end without apparent cause, simply because its race is run."

Specimens of Middle Scots. With Introduction, Notes, and Glossary. By G. Gregory Smith, M.A. Edinburgh: Blackwood & Sons. 1902. Pp. lxxv., 374.

This volume deserves a cordial welcome, not only from special students of Scots, but from all who are interested in the earlier periods of the English language and literature. Mr. Eyre-Todd's 'Abbotsford Series' and Dr. Hand Browne's 'Early Scottish Poets' have hitherto had the field to themselves, and neither of these collections made any serious pretensions to scholarly accuracy. Mr. Gregory Smith presents here some thirty selections illustrating the most important writers from the middle of the fifteenth to the middle of the seventeenth century; the texts are carefully printed from the most authoritative sources accessible; and the notes and glossary show an acquaintance with the results of recent scholarship which has been lamentably rare in editions of Scots texts.

As the title indicates, the volume is not intended to represent Early Scots, though an appendix includes extracts from 'Ratis Raving,' 'The Bruce,' 'Lancelot of the Laik,' and 'Rauf Coilzear.' This limitation of scope is defended on the ground of the identity—so strongly insisted on by Dr. Murray—of Early Scots and Northern Middle English. Whether this identity is regarded as proved or not, there is an obvious drawback in the lack of an easily accessible group of documents illustrating the language out of which the dialect of the present extracts developed.

This limitation appears the more regrettable when one comes to examine Mr. Gregory Smith's introductory treatment of the grammar and phonology. Even as this stands, it forms the most important contribution to the subject since Dr. Murray wrote his 'Dialect of the Southern Counties of Scotland,' thirty years ago. But the absence of any systematic treatment of the sounds of Early Scots makes the purely descriptive account here given of Middle Scots phonology less intelligible and less valuable.

The discussion of the constituents of the vocabulary of the period is independent and interesting. The most notable departure from a view hitherto accepted is in the statement of the comparative importance of the French and the Latin elements. Mr. Gregory Smith attacks vigorously the misleading picture of French influence given in such works as the exceedingly uncritical 'Critical Inquiry into the Scottish Language' of M. Francisque-Michel. Conversely, he shows that, to an extent far greater than has hitherto been supposed, the Middle Scots writers supplemented their native vocabulary with words and idioms drawn directly from Latin. The sections on the Celtic and Scandinavian contributions are refreshingly free from the

faddist tendencies that have marked much of the work on these subjects.

Thus, taking the book for what it professes to be, we are able to congratulate ourselves on the appearance of a volume which at last provides a satisfactory starting-point for the systematic study of the most unjustly neglected period of English.

The Story of Athens. By Howard Crosby Butler. The Century Co.

Mr. Butler attempts to give a sketch of the life and art of Athens from its earliest beginnings to the present day. To compress "the glory that was Greece" into a volume of 500 pages is, naturally, beyond human power. Mr. Butler's "record of the life and art of the city of the violet crown read in its ruins and in the lives of great Athenians"—to quote the sub-title—is a mere outline as far as the history and literature of Athens are concerned. But he is a trained archæologist, whose main interest is architecture, and he uses his historical sketch of Athenians and Athenian enterprise as a mere thread on which to hang some very minute and interesting descriptions of the monuments in the light of excavations. They will probably be of more use to the popular reader than to the scholar, who would turn to other sources for expert information. There is, however, one feature of Mr. Butler's book that even the scholar need not despise. We refer to the numerous line drawings of the Athenian monuments of architecture; these are admirably done, and are in most cases more useful than photographs would be; but Mr. Butler reproduces also some excellent photographs of the sculptures.

There is an amusing discrepancy between Mr. Butler's scholarly precision in treating of the monuments and his purely popular handling of history. On page 215 we read, in a long, minute description of the Parthenon, that

"the intercolumniations at the four angles were narrower than those adjoining them on the ends and sides, and were spaced with special design to give greater solidity to the corners. . . . The octostyle porches made it possible to depart from the usual design for pronaos and epinaos, . . . and instead of the common form (distyle in antis) to provide broad, open, hexastyle porticos within the octostyle façades."

We quote this to show the author's care for precise detail in a question of architecture, and give, by way of contrast, an extract from a florid and purely imaginary description of an incident of the Persian invasion (p. 129):

"Before any of the rest, a crippled youth had toiled up the long, winding ascent to the Acropolis. . . . Fair-haired he was, and his fine face was bronzed by the scorching Attic sun; his eyes were full of fire, which his crooked form bade him ever suppress, and the valor of his soul almost consumed him as his heart and mind strained toward the scene of the approaching conflict. The sultry day wore on, the burning sun drove many of the watchers, one by one, to seek the shade of the temple porticos, but the youth never changed his place, nor turned his head as hour after hour passed on."

Mr. Butler naïvely admits that "this little story was told to me by an old Greek sailor whom I met one morning upon the Acropolis. I never saw him afterward, and was unable to find out where he got the story."

A future edition would be greatly improved by the omission of about 200 pages of uncritical statement. The style is marred by metaphors which, as on pages 192 and 256, are usually too long to quote. On page 484, a "bucket of devastation" is "dashed over the city." Here and there we have noted careless English; *e. g.*, page 461: "It would seem as if . . . *that* a church . . . must have grown up." "He converted into a bad Governor" (p. 494). The name of the Greek orator is twice written Issæus, which is unusual; on page 73 for Ilyssus read Ilissus. The faults of the book are the more conspicuous because of its obvious merits. If only on the ground of its illustrations and architectural descriptions, it is to be recommended to classical students who have not had the benefit of a sojourn in Athens, or have not access to archæological publications.

The Anglican Episcopate and the American Colonies. By Arthur Lyon Cross, Ph.D. Longmans, Green & Co. 1902.

The carefulness of this piece of research is vouched for by its acceptance for the writer's degree of doctor of philosophy at Harvard University and by its winning of the Toppan prize in 1899. To wide study the writer has added some skill in the presentation of his matter, though he has neglected the humorous implications of his subject where some of his ecclesiastical predecessors in the field have made much of them. An introductory chapter deals in a general way with the beginnings of episcopal control over the colonies, the only permanent results of which were the establishment of the Church of England in Virginia, and the fixing of the precedent that the diocesan control of the English plantations in North America should be vested in the Bishop of London. This precedent originated in the Stuart policy, instigated by Laud, which sought to make the English Church coextensive with English government throughout the known world. A second chapter covers the policy and work of Compton, who was Bishop of London from 1675 to 1714. He reëstablished the authority of his bishopric, which had lapsed during the period of the civil war and Commonwealth, stimulated individual enterprises of Church extension in the colonies, and instituted the custom of sending commissaries with delegated authority. But his great work was the formation of that Society for the Propagation of the Gospel in Foreign Parts, to which the present Protestant Episcopal Church in the United States owes its origin in a preëminent degree. Bishop Gibson's term, 1723-1748, was characterized by a fair trial of the commissarial system, and an absence of political intention from the general conduct of Church affairs in America. But Bishop Sherlock, who came next in order, was resolved upon the establishment of Anglican bishoprics in America. He was not the first, however, who burst into this troubled sea. Laud and one or two of the Restoration bishops made abortive attempts.

The missionaries of the S. P. G. endeavored vainly to enlist home influence in favor of the episcopal scheme. Their efforts seem to have been without political bias. This is one of Mr. Cross's findings that has controversial importance. One Dr. Johnson in America, and Bishops Secker and Sherlock in England, gave the business a political twist. In fact, Sherlock's interest in the American churches was confined to their political aspect, and to their control by Anglican bishops in residence. The Mayhew and Chauncy controversies have each a separate chapter. In these the political infusion was of the strongest kind. One does not get from Mr. Cross's pages so vivid an idea of the compliments exchanged as from those of Foote's 'Annals of King's Chapel.'

In conclusion, Mr. Cross draws out from his studies an inference unfavorable to the opinion that the attempt to impose Anglican bishops on America had an important effect in bringing about the separation of the colonies from Great Britain. In 1815 John Adams pronounced this opinion with the emphasis characteristic of his family. The effect, he said, was as certain as any in the history of North America. If Parliament could introduce bishops, it could impose the whole hierarchy and forbid dissent. Mr. Mellen Chamberlain supported this view a few years ago in an able address. Mr. Cross concedes the later political character of the episcopal controversy, but contends that the strained relations which foreboded independence strengthened the opposition to an Anglican episcopate much more than the push for this in England and America made definitely for political alienation. And he appears to make his contention good without any forcing of the note.

Syllabus of Lectures on the History of Education. With Selected Bibliographies. By Ellwood P. Cubberley. Macmillan Co. 1902. Pp. 302.

This handbook is a revision of a syllabus of lectures used by the writer with a class in the history of education. It contains topical outlines of the various chapters in the history of education, and bibliographies in connection with each chapter. The former section, especially without an index, will hardly be used. A syllabus, like a notebook, is a great help to the man who makes it, but of doubtful value for anybody else. The student of the history of education should make his own outlines, and each individual will classify and divide the subject in his own way. The bibliographies, however, are of great value, and they cover the whole field of conventional education from ancient Oriental education to the nineteenth century in Europe and European influence on American education.

Our indebtedness to the author for these is so great that criticism would seem ungrateful were it not that some of the improvements indicated may be made in a future edition. The prime defect of the book is the incompleteness of the references given, as one or two concrete examples will illustrate. On page 119 the following reference is given: "Whitcomb, M.: The Autobiography of Thomas Platter," without date, place of publication, or other clue. The beginner in education will naturally suppose this refers to a book edited by Whitcomb, but he will search in vain for it. The student of education who cares to trace it, may think to look in Whitcomb's 'Source-Book of the German Renaissance,' and, if so, he will find a selection from the autobiography of this famous wandering student; but Mr. Whitcomb, so far as

the reviewer is aware, has published nothing else on Thomas Platter. On page 34 is a reference to "Nettleship, Henry: Lectures on the Republic of Plato." Here again only the special student is likely to know what is referred to. If Nettleship's famous essay on "The Theory of Education in the Republic of Plato" is meant, then the reference should be to Abbott's 'Hellenica,' in which this was published; or if a reprint, then that should be mentioned; or if a separate volume of lectures, then the date and place of publication should be given. Thirty-nine similarly defective references occur on the same page. Ziegler, whose 'Geschichte der Paedagogik' is naturally referred to again and again throughout the book, is apparently mentioned but once, and then his name is misspelled; the reference is always to Baumeister, because this history happens to form a volume in Baumeister's "Handbuch." Even in the note on page 1, Baumeister instead of Ziegler is referred to as a standard authority. Such slips raise a suspicion that much of the work may have been done by students rather than by Professor Cubberley, and in some degree depreciate the value of the book.

The author's ideal is excellent. As stated in the preface, "an attempt has been made to study the history of education as a phase of the history of civilization." From this wider point of view the bibliographies, excellent as they are, are by no means adequate. By cutting down the outlines their value would hardly be diminished, and space might be gained for references on the wider social, political, and industrial relations of education, and for a general index.

American Food and Game Fishes: A Popular Account of All the Species Found in America North of the Equator, with Keys for Ready Identification, Life Histories, and Methods of Capture. By David Starr Jordan, Ph.D., and Barton Warren Evermann, Ph.D. Doubleday, Page & Co. Small 4to, pp. 623. Illustrated.

There are good reasons why this book should do much toward diffusing knowledge of the fishes. It is profusely illustrated by figures in the text, and it has more than a hundred half-tone plates, including some in colors. The descriptive matter is generally very good; in places where somewhat deficient, it is helped out by the excellent figures. The latter, excepting the colored ones, are distributed with the text pertaining to them—a much more convenient arrangement than if placed together or in an atlas. So little being known of many species, the popular account in their cases is little more than the scientific description. The game fishes are those commonly known as such; the food fishes here depicted include many rarely or never seen in our markets. It is said there are about 3,300 known American fishes found north of Panama in the waters of North America. In our authors' words: "All of these the present writers have described in detail in a book of four volumes and 3,313 pages, called 'The Fishes of North and Middle America,' to which those who wish to study our fishes more seriously are referred." The present volume is to cover the same area, including only fishes good for food or good for sport.

Errors in spelling, some of them copied in the index, occur on various pages; for instances: "leart" in the name of "least whitefish"; "Brachydenterus" for Brachydeuterus, "Rachocheilus" for Rhacochilus, "Otraciidæ" for Ostraciidæ, "Argentinidiæ" for Argentinidæ, and others. One of the plates bears the legend, "Salmon Leaping a Falls." In the account of the Embiotocidæ (the viviparous perches), page 469, it is said that "since the discovery of their viviparity by Dr. Gibbons in 1854, these fishes have been of special interest to zoologists," and on page 472 the statement is made that Dr. A. C. Jackson "on June 7, 1852, discovered the viviparity of these fishes, and first brought the fact to the attention of Professor Louis Agassiz." The first printed notice of the viviparity of these fishes appears to be that of Prof. Louis Agassiz, November, 1853. Dr. Gibbons's publications appeared in 1854. Professor Agassiz states that his information was first received in Mr. Jackson's letter of February, 1852, from which it is evident that the June 7 referred to by the latter as the date of his discovery must have been that of 1851.

BOOKS OF THE WEEK.

Anderson, W. J., and Spiers, R. P. The Architecture of Greece and Rome. London: B. T. Batsford; New York: Scribners. $7.50.
Baedeker, Carl. Northern Italy. New ed. Leipzig: Karl Baedeker; New York: Scribners. $2.40.
Bargy, Henry. La Religion dans la Société aux Etats-Unis. Paris: Armand Colin. 3 fr. 50c.

NEW YORK, THURSDAY, JANUARY 29, 1903.

The Week.

The latest news concerning the Venezuelan dispute betokens a peaceful settlement and an early raising of the blockade. For this result all the parties concerned should be congratulated, but none more so than the Government and people of the United States. The happy turn of affairs has doubtless been hastened by the adverse comment of the press of both Europe and America on the German bombardment of San Carlos, and the attempted justification of it by Chancellor von Bülow. Regarded as a method of maintaining German prestige, that attack upon a mud fort and a collection of naked fishermen must be regarded as a failure. It appears now that Minister Bowen came to Washington with full powers to settle the controversy, and it will probably turn out that this fact was known in Berlin before any guns were fired at San Carlos. Possibly it was not known to the German Admiral, possibly the Venezuelans fired the first shot; but the event has left the impression on the minds of impartial observers that Germany wanted to show what her navy could do, and that she chose an inauspicious time for making that demonstration.

Settlement with Colombia of the question of American rights in the Panama Canal territory brings considerably nearer the date when, if the treaty be duly ratified in the Senate, payment must be made to the Panama stockholders. This matter has already created great interest in Wall Street, where curiosity converges on the question in what form the payment will be made, and exactly how it will be provided for. The arrangement with the French owners of the franchise contemplates, as is well known, outright payment of $40,000,000 to them at Paris. This money, so far as now appears, will be taken from the Treasury surplus, of which $149,882,000 is now held in the Government's own vaults, offset by $86,792,000 immediate liabilities, while an additional $142,921,000 stands in the national banks subject to the Treasury's check. These sums, it will be seen, are quite sufficient to provide for a $40,000,000 payment, and it is safe to say that the suggestion of an issue of Government bonds to provide the money will get no hearing. Indeed, the $40,000,000 for the purchase was formally appropriated by Congress, at the close of the last session.

What chiefly interests the money market, however, is the question whether the remittance in question, with the $10,000,000 due to Colombia, will or will not be taken from the general money market; that is to say, whether exchange on London or Paris will be bought with cash from the Treasury's own vaults, or with checks on the depositary banks. It would seem, in view of the Treasury's recent declaration that its cash holdings had fallen nearly to a "working minimum," that the bank deposits would be used. The still more interesting question, from the financial point of view, whether the payment would or would not involve large shipments of gold to Paris, is not so easy to answer. Such payments do not always drain a market of its gold. The $1,000,000,000 German indemnity claim on France, after the war of 1870, is a classic case in point. This huge payment, though provided by loans from the thrifty French people, was actually made, for the most part, in bills of exchange on other countries. Apparently, France had created so huge a credit fund elsewhere, through transfer of its own investment capital during the war, that it was able to draw on the English market for the gold. On the other hand, our own payment of $20,000,000 at Paris, during 1899, in settlement with Spain for the Philippine cession, went, to all practical purposes, in gold. The formal payment, it is true, was made in bills of exchange without coincident gold exports. But the very heavy demand for foreign remittances, during April, forced up the sterling market to a figure which resulted, two months later, in the export of almost exactly $20,000,000 gold to Europe.

From what has been given out of the treaty for determining the Alaskan boundary, it appears to be another triumph for Mr. Hay's diplomacy. The clause which assures to the United States all the coast settlements already in existence in the disputed territory, will hardly be popular in Canada. For this includes Skaguay, at the head of the Lynn Canal, and lessens the likelihood that Canada will gain the desired access to the Pacific. Still, this condition of the negotiation is fair to both parties, for Skaguay was settled at a time when American possession of the Lynn Canal had not been seriously questioned. The plan for a commission of six, three Americans and three British, has at first sight the disadvantage that the court may divide evenly and no decision be reached. It should rather be taken as an indication of the friendly spirit in which the investigation is to be conducted. Either nation is in the position of assuming that the representatives of the other are open to conviction. The practical difficulty arising from the lack of an umpire is likely to be small, for the boundary commission will not be precisely in the position of a court which must accept or reject *in toto* the entire claim of one or the other party to the suit. It will rather review the whole question and settle it in equity. It will concern itself rather with the Alaskan coast line, as it is now known to be, than with what the Russians of the thirties or the Canadians of the nineties have thought about that littoral. The boundary affair is, in the main, a very simple one, though somewhat obscured by national prejudices on either side. It is matter of rejoicing that this long dispute is now likely to be adjusted by direct and friendly negotiations.

Congressman Hill of Connecticut carried his point on Thursday by defeating the currency bill reported by the House Philippine Committee, and substituting a measure which establishes the gold standard in the islands, with a subsidiary coinage of limited legal tender, redeemable in gold at the rate of two pesos for one American dollar. The substitute provides that the money of the United States shall be legal tender in the Philippines, and declares the coinage laws of the United States to be in full force there. It provides for the redemption of the Mexican and Spanish silver (not including any Mexican pesos imported into the islands after March 15, 1903) at their bullion value, as declared from time to time by the Philippine Commission. After six months no coin except that of the United States shall be full legal tender, but with the proviso that all debts, except those otherwise provided for in the contract, owing on the date when the act shall take effect or contracted within six months thereafter, shall be payable in the silver coins now in circulation in the Philippine Islands or in the lawful money of the United States at the rate of exchange prescribed at the time by the Philippine Commission. As there is no silver of full legal tender provided for, the limping standard will not be introduced. The vote on the adoption of Mr. Hill's substitute was 146 to 128.

It is a very queer story that comes from Washington implying that the Senate's Philippine currency bill is part of a scheme for a kind of Latin Monetary Union, including Mexico, China, the Straits Settlements, and the Philippines, in order to do something for silver. How this end is to be accomplished is not stated, and we fancy that it will not make much headway in the world until somebody can write down the *modus ope-*

randi and point out the consequences of each step to be taken. To all persons who think that a union of different countries to regulate their monetary affairs on a common basis and by concerted action is feasible, we recommend a study of Professor Willis's 'History of the Latin Monetary Union.' They will there find ample proof of the futility of such attempts. If it be said that this Washington plan is entirely different from the one whose mishaps are so faithfully and minutely chronicled by Professor Willis, then let us have the Washington plan formulated by somebody who knows what it is. At present it is too cloudy for intelligent criticism.

The discussion in the Senate on Saturday upon the Indianola post-office case undoubtedly marks the revival of a series of debates upon the race relations in the South, which probably will become one of the leading issues of the next Congress. The question of the disfranchisement of the negroes is certain to come before the next House by means of contested election cases. The standing of the whole Virginia representation must be passed upon by the House Elections Committees. The perennial motion for the reduction of the South's representation in Congress is also soon to be heard from, while the hubbub about negro office-holding is bound to continue as long as President Roosevelt declines to "shut the door of hope" to aspiring and qualified negro candidates for Government positions. Reduction of representation the Southern States will probably accept without demur, rather than give up their present unrepublican Constitutions. As long as men like McLaurin and Tillman continue to represent the South, it is useless to expect that any just demand for equality of opportunity for the negro can ever obtain a hearing. To this the Tillman reply is simply, "Kill." The whole subject is beclouded, too, by the fear of negro domination, just as the ante-bellum South was nightly terrorized by fears of slave insurrections. In the Indianola case, Senator Spooner's citations from the executive documents showed conclusively that the postmistress was forced to resign by a mass meeting of white citizens, who could find no other ground for fault-finding than the color of her skin, and were working in the interests of a Republican candidate for the office.

It seems cruel to mention it, but Senator Hoar is evidently falling hopelessly behind the times. It is all very well for him to have conscientious Constitutional views about the prerogatives of the Senate and of Congress in its relations with the President, but he ought to know that nowadays nobody pays any attention to little things like these. What up-to-date member of the Senate or House cares for the prerogatives of Congress so long as his local bill or his legislative scheme goes through? Old fellows like Senator Hoar will have to get used to the new methods. There was a time, even at Albany, while Mr. Roosevelt was Governor, when some faint protests were heard against executive pressure upon the Legislature. Gov. Roosevelt was something of a rough rider in matters of prerogative when he was at Albany, we may tell Senator Hoar, but they had to make the best of it. It was he, for instance, who took the emergency message down from the dignified shelf where the Constitutional Convention clearly intended to place it, and converted it into a ready instrument for passing legislation, local and otherwise, like greased lightning, *sans* printing, *sans* debate, *sans* everything. Senator Hoar evidently does not yet know what it means to have a young and enthusiastic President.

Senator Hanna is certainly loyal to his friends, even when the latter are disreputable. He has now come forward to the rescue of Addicks. In his official capacity as Chairman of the Republican National Committee, he telegraphs to the Regular Republicans in the Delaware Legislature that he hopes they will never stoop so low as to vote for an honest Democrat in order to prevent the success of a Republican corruptionist. The Republican party, he declares, is "entitled to the fruits of victory," and the fact that they are rotten fruits does not trouble Mr. Hanna in the least. He has done what he could to disgrace both Delaware and the United States Senate. Apparently, the honorable compromise offered by the Delaware Democrats is to be rejected. There is no sign, however, that Addicks, even with Hanna's help, can win over enough votes to be elected. So the best prospect for the State at present is that it will go unrepresented. Better that, *pace* Senator Hanna, than to go dishonored.

All organs of public opinion in Congress, the press, and the bar ought to take notice of the Doblin-Quigg case at Washington, and not allow it to pass off as a mystery, still less as a matter for jest or sarcasm. It is perfectly certain that perjury has been committed of a peculiarly brazen and damaging kind. It is probable that corruption of a Congressman was attempted, in order to get money from the public treasury. Moreover, the dignity and authority of Congress have been insulted and flouted in the most glaring manner. If such things can be done without somebody going to the penitentiary, there is not much use in having laws and a system of jurisprudence. Whatever we may think of Quigg or of Lessler, there cannot be two opinions about Doblin. This fellow went before a committee of Congress, in response to a legal summons, and swore that Quigg authorized him to offer $5,000 to Congressman Lessler for his support of a bill to buy torpedo boats. At the very next meeting of the Committee he swore that his former statement was false, and that he had been induced by Lessler to make the former statement. Thus he acknowledged that he had committed perjury, and accused Lessler of subornation of perjury. Doblin ought to have been arrested before he left the committee room, even though his counsel promised to produce him when wanted. The offence he had committed was too grave, the insult he had offered to the highest authority in the land—the very source of low and justice—was too shocking to be tolerated or neglected for a moment. Quigg will probably escape the clutches of the law, for nobody can now believe anything that Doblin says, whether for or against him.

Gov. Odell is said to have been too busy to see Superintendent McCullagh when that worthy called to present his annual report at Albany on Thursday. The Superintendent's term of office has expired, and it is understood that he seeks reappointment. We trust that, however busy he may be, the Governor will find time to look up McCullagh's record as head of the Metropolitan Bureau of Elections before he makes up his mind to reappoint him, and also to read carefully the various statements, all bearing the earmarks of authenticity, which the Superintendent is reported to have made, and has not denied making, since the submarine boat scandal came out in Washington. What deduction must the Governor draw from the Superintendent's assertion that Mr. Lessler conceded his election to be due largely to McCullagh's use of the election machinery? Is it true, then, that he has been, as Democrats have charged, a mere annex of the Republican machine? Is he using his office and his deputies to pack primaries and control elections? And, having done this, has he been trading upon the gratitude of his beneficiaries to get them to vote for schemes in which his "particular friends" are interested? There is certainly an appearance of this. The wisdom of keeping him in his place might well have been questioned after the exhibitions of childishness and folly which he gave previous to the last election, with his indiscriminate and unwarranted challenges throughout the city, but this is as nothing compared with his course as revealed by his recent statements. A proposal to abolish the bureau would be worth serious consideration. It certainly would be better to abolish it than to permit McCullagh to remain at its head.

Gov. Pennypacker of Pennsylvania treads softly in his message to the Legislature. There are many excellent reflections in his first State paper, indicating philosophic habits of thought and scholarly attainments; but one searches it in vain for one bold word directed against the political abuses which have made the name of Pennsylvania a by-word among the States. One terrible evil, it is true, he does allude to feelingly: "There is no more dangerous public vice," he declares, "than the prevalent affectation of disrespect for those engaged in the performance of the work of the cities, the State, and the nation." This evidently means Ashbridge, Durham, Quay, and the rest. The Governor has no intention of falling into this "prevalent affectation," but, on the contrary, promises to consult and confer "with all who have facts to impart or conclusions to present, especially those who, in common parlance, are called politicians." How Quay must smile when he reads this rubbish! Passing from so gloomy a discussion as that of public disrespect to such high dignitaries as Quay and Durham, Gov. Pennypacker has a word to say about Pennsylvania products profiting foreign markets. "While it is a satisfaction to see libraries in England and universities in Chicago being erected from the outcome of the iron and oil of Pennsylvania, due primarily to her liberality," says the Governor, "we may be pardoned a feeling of regret that so much of the wealth of her production is controlled and utilized elsewhere." That this is the stern logic of the Pennsylvania protectionist, who will deny?

If any one had a lingering hope that Gov. Pennypacker might yet indicate some desire to better political conditions in Pennsylvania, it must now have received its death-blow. If Pennsylvania is ever to be raised from the low estate into which she has fallen under the domination of Quay and his gang, the first step must be a reform of the ballot law. This is common knowledge in Pennsylvania, and is indeed so patent that both parties, in their platforms last year, promised modern registration laws and other measures to prevent frauds on election day. The necessity for such enactments, moreover, was rendered more clear than ever before by the very election which made Judge Pennypacker Governor. The most barefaced frauds in Philadelphia were exposed by the election figures. We quoted at the time the returns from several Philadelphia wards where, according to the official tables, the total vote more than doubled that of the year before, the increase being made up wholly of alleged Republican votes. Of course, no such votes were ever cast. Surely, with his party platform before him, Gov. Pennypacker should have had the scant courage required to say something about these frauds. But not a word does he utter. He does say that the present law is "cumbersome and inefficient," and suggests that it be changed, but he hastens to add that "the thought that something ought to be done by means of the law to encourage independent voting and to make it difficult to vote a full party ticket is mere vicious theorizing." What can the cause of decent government hope from a man, however respectable his antecedents, who thus exhibits himself on his entrance into office?

Corporations are not alone in using a million-dollar yardstick. The latest financial exhibit of the United Mine Workers of America, presented at the annual session in Indianapolis, amply explains how that organization could support the long strike of last summer. Manifestly, the old plan of starving out strikers cannot avail against an organization, which, after expending nearly $2,000,000 in strike aid, ended or suspended the conflict with over $1,000,000 in the war chest. There is a not obscure menace in those figures, as well. An organization thus financially buttressed is in a fair condition to renew the struggle, if its members are so inclined. Plainly, such a financial power has to be reckoned with, and as long as such a huge fund is in sight, it is idle to expect disintegration of the Mine-Workers' Union.

A Mount Vernon saloon which dispensed the beer of the Central Federated Union was recently "cleaned out" by representatives of the National Union of the United Brewer Workers. This same doubly united body has also declared a boycott against one of our city brewers. The grievance in the latter case is that the employer will not force his men to resign from the local union to which they already belong, and make them join the United Brewer Workers. The lot of an employer under these circumstances is an unhappy one. He cannot consult his customer's thirst or his own profit until some higher power has decided which of two sorts of union beer is alone authentic and vouched for by organized labor. Instances like this of squabbling unions continue to show how far the labor movement still is from that sobriety and wisdom which it must attain if it is to gain public respect and confidence. What will become in bad times of organizations which, having professedly common aims, cannot in good times agree upon common action? In the present case it is encouraging to note that President Gompers of the American Federation of Labor has declared the boycott to be unauthorized.

Mr. Brett, the President of the Macmillan Company, protests, in a letter to the *Evening Post*, against a new ruling of the Appraiser's Department of the Custom-house. Under former practice, the duties on imported books were assessed on their actual cost in the foreign market. Under the new ruling they are to be assessed on their average price in the foreign market, if it is higher than the actual price paid by the American importer. This ruling breaks up an established trade of long duration, since prices of certain lines of foreign books which are regularly imported have become fixed, but they cannot be sold at those prices under the new ruling. Moreover, the foreign publisher, when he discovers that the Custom-house has raised the price of his books by a certain percentage, raises his selling price by the same amount, so that the new ruling operates to the advantage of the foreign seller and to the disadvantage of the American buyer. Among all the exasperating devices invented to cripple trade and to lead Americans to execrate their own Custom-house, this is perhaps the least defensible, since it has the excuse of neither revenue nor protection. The Government does not need the extra money; on the contrary, it needs relief from its surplus. And, as Mr. Brett shows, the doctrine of protection is in no way concerned in the matter. It is true, however, that the law warrants the appraiser in taking this step.

President Sharpless of Haverford has polled the college presidents on the subject of football, and brings out a complete unanimity of opinion. All agree that the plunging mass plays should be abolished, and the rules changed to favor agility rather than brute strength. The presidents in council differ only as to who is to be the one to begin. This is a matter of complete indifference. There is nothing easier than to bell the football cat. Let any president of one of the great universities say to the Committee on Rules, which is soon to meet, that his institution will not be allowed to engage in intercollegiate contests until the present rules have been radically modified. If President Eliot, for example, should take this stand, the reform of the game would be brought about promptly, for very slight changes would deprive football of its present appearance of a mêlée and restore the more open play of fifteen years ago. Let the Committee on Rules increase to ten yards the distance which the ball must be advanced in four "downs," and the present short rushes, which are uninteresting to the spectator and dangerous to the player, would disappear. Forbid more than four men to play behind the line, and the present crushing "tandems" and "formations" would be impossible. These simple changes would bring back bold running and frequent kicking—always the most attractive features of football, and of old the very reason of its existence.

THE COLOMBIAN TREATY.

By bringing the negotiations for the Panama Canal to a successful close, Secretary Hay has gained a notable advantage for the country and new laurels for himself. His task was in any case one of great delicacy. It had become doubly difficult because of recent intervention by American marines on the Isthmus in a way to ruffle the sensibilities of the Colombian Republic. Any mishandling of the canal negotiations might have put off to the Greek kalends the transfer of the French concession to us. The manner in which Mr. Hay has reconciled the just pride of the owners of the Isthmus with the necessary preponderance of ourselves as owners of the prospective canal, is highly honorable. The Hay-Herran treaty, then, stands not only as a model of successful business negotiation, but also as a striking instance of fair, open, magnanimous, and conciliatory dealing with a weaker Power. The result is even better than had been looked for. After the long dispute over the annual rental to be paid to Colombia for the right of way, it was commonly supposed that reference to a commission or court of arbitration would be necessary to determine the amount. Such a proceeding, however, was full of danger, since the inevitable delay would infuse new life into the Nicaragua project, and might put an end to the Panama bargain altogether. The temper of Congress on this subject was very uncertain, and although the Canal Commission was more and more inclined to the opinion that a canal in Nicaragua was impracticable, the House of Representatives was strongly committed to the opposite belief. The danger incident to an arbitration having been passed, there is nothing to wait for except the Senate's ratification of the agreement.

The treaty grants an exclusive franchise for the canal for one hundred years, renewable at the sole and absolute option of the United States so long as the United States may desire, in consideration of the payment of $10,000,000 down and an annual payment of $250,000. The annual payments are to begin nine years after the date of the ratification of the treaty. The neutrality of the canal is declared to be perpetual, according to the terms of the Hay-Pauncefote Convention of 1901. This includes the right of all nations to use the canal without discrimination in tolls or otherwise. The right of the United States to land troops for the protection of the canal is conceded in cases where the Government of Colombia fails to afford such protection. General sovereignty over the zone of the canal is reserved to Colombia, but the United States is authorized to establish judicial tribunals in said zone, which shall have exclusive jurisdiction of all controversies therein between citizens of the United States, or between them and citizens of any foreign nation other than the republic of Colombia. Provision is made also for joint tribunals to have criminal jurisdiction of offences committed within the zone, and in admiralty cases. The treaty seems to have been drawn with the utmost care and in the spirit of perfect fairness. It would be difficult to point out any feature to which reasonable exception could be taken. The time for ratification expires September 22, 1903. If the present session of Congress should expire before ratification is voted on (which ought to be impossible), a special session of the Senate would doubtless be called by the President to complete the transaction.

Due acknowledgment should be made to the republic of Colombia for its jurisdictional concession, seeing that all the Spanish-American countries are extremely sensitive on this subject. Exemption from local jurisdiction granted to citizens of Christian countries resident in Mohammedan countries and in some other non-Christian lands goes by the name of extra-territoriality. This is not exactly what Colombia grants to us, since citizens of the United States residing in Colon, or anywhere in Colombia outside of the canal zone, are subject to the Colombian tribunals exclusively. The concession is limited strictly to the canal zone, but it is all that we could ask.

We are sure that this treaty will be heartily welcomed by the American people. We believe, too, that the best possible bargain, if not the only possible one, has been made to insure an interoceanic canal. It is the growing opinion of engineers, both official and unofficial, that De Lesseps was right when he chose the Panama route in preference to all others. If the Panama line is the most economical, both for construction and for operation, we have made a great bargain in getting the concession and property of the French Company for $40,000,000, which cost them many times that amount, and is now worth more than that to us, even if much money was wasted under the De Lesseps management. We may now for the first time look forward to the realization of hopes which have been entertained for three-quarters of a century, that the isthmus will be pierced and made available for the ships of all nations within a computable time. The period named in the treaty for the beginning of work on the canal proper is two years, and for its completion twelve years, with a proviso for accidents and unforeseen obstacles.

LATEST ASPECTS OF THE CUBAN TREATY.

The exclusion clause added to the Cuban treaty by the Senate Committee on Foreign Relations provides that "no sugar, the product of any other foreign country, shall be admitted by treaty or convention into the United States, while this convention is in force, at a lower rate of duty than that provided by the tariff act of the United States approved July 24, 1897." The clause in this form avoids an embarrassment which might arise in case Congress should deem it advisable, at some time during the next five years, to reduce or repeal the duty on sugar. It does not tie the hands of Congress and the President in their legislative capacity, but does undertake to tie the hands of President and Senate as to treaty-making. If the Cuban treaty goes into effect, we pledge ourselves not to offer as good terms to any other sugar-producing country during five years. It is conceivable that the Democrats may carry the next Presidential election. It is possible that even a Republican President and Senate may find reasons for offering to Germany or France, in the way of reciprocity, the same terms that we now offer to Cuba, but they will not be able to do so. We do not marvel that Democratic Senators, who have heretofore favored reciprocity with Cuba, look with suspicion upon this clause, and all the more since it was not a part of the treaty as it came from the hands of the negotiators.

There has been some debate in the German Reichstag lately on the American interpretation of the most-favored-nation clause, and an understanding has been reached that Germany shall construe it in her dealings with us in the same way that we interpret it in our dealings with her. This, it should be remarked, is not a new decision on the part of Germany. Professor Moore of Columbia University has pointed out, in a discussion of this subject, that Germany recognized and assented to the American interpretation in a treaty which she made with Hawaii in 1879. She then agreed that special advantages in trade or navigation granted by one nation to another, in exchange for equivalent advantages, did not bring the most-favored-nation clause into operation as regards any third party. This has been the contention of the United States since 1817, when John Quincy Adams, as Secretary of State, formulated it in a note to the French Minister at Washington. Any gratuitous advantage given to one nation must be given immediately and *ipso facto* to any other which is sheltered by the favored-nation clause, and it can be claimed in return. But favors granted by treaty in the way of bargain for favors received do not come within this category.

The next question that presents itself is whether a country, A, acting under the most-favored-nation clause with B, is bound, when it gives special favors to C for a consideration, to offer the same to B for a like consideration. Good faith would seem to require such action. It may happen, however, that B is not able to give the same favors that C has

offered. B may not be the producer of similar goods, or she may have given previously and without consideration everything she had in the way of trading capital. That is England's position now. The most-favored-nation clause, as now interpreted, has nothing of value for her, and she can recover her rights under it only by building a tariff wall of her own, and lowering it here and there according to the bargains she may be able to make with other countries. There is a strong suspicion that it is the aim of her present Colonial Secretary to introduce that policy.

Germany, however, is not thus hampered. She has not given away her trading capital in advance. She announces that if the most-favored-nation clause is to be annulled by interpretation, so be it. She will admit the cereals of Russia and Hungary at a minimum tariff in exchange for their minima on other things, and then she will extend the same favors to us, not by virtue of the most-favored-nation clause, but by way of bargain. That will be perfectly fair, and we could not complain. So we come together to see how we can place ourselves on the footing of the most-favored-nations as an exporter of grain to Germany. The latter would be apt to ask for the admission of her sugar at our ports at the same rate of duty as that of Cuban sugar in return for suitable concessions to our grain or other exports. Here, perhaps, we run against a clause in our treaty with Cuba which binds us for five years not to make any concessions on sugar to Germany, no matter what consideration is offered in return.

Germany would be justified in considering this a violation of both the letter and the spirit of the most-favored-nation clause, since it takes from her the opportunity of recovering her trade footing with the United States by offering equivalent advantages. The case with Great Britain is much the same. Her West Indian colonies are entitled to as good treatment as we give to Cuba, and, considering how much we owe to England in connection with the war which set Cuba free from Spain, we ought not to shut and double-lock the door against Jamaica, Guiana, etc., as is proposed in this new clause of the Cuban treaty. It would be interesting to know what the controlling motive for this clause is. No tariff bill ever passes Congress without a private job in it, either concealed or open. The Cuban treaty is a tariff bill on a small scale. Perhaps an agreement has been made between the domestic and the Cuban sugar interests to divide the American market for five years to the exclusion of all other producers.

HERRING, LODGE, AND THE TREATY.

The herring are those that are smuggled into Massachusetts ports from Newfoundland; Lodge is the Massachusetts Senator under whose nose the smuggling is done; the treaty is, of course, the Hay-Bond treaty, which would turn the traffic in contraband herring into an honest industry. Our attention was called to the matter by an observation in a contemporary. Commenting on the statement made by a representative of the fish trade, that the passage of the Hay-Bond treaty would mean the loss of hundreds of thousands of revenue, the *Syren and Shipping* remarked tartly that, if this were so, the loss would be no greater than it had been for years past. The saying seemed dark to us—nay, mathematically impossible—but we had sufficient confidence in our well-informed contemporary to look up the whole matter of the Newfoundland coast fisheries. The results of this investigation show, in brief, that the winter herring entered free at Gloucester and Boston by American "fishermen" are bought of the Newfoundlanders, and hence are subject to duty; that free entry is secured by perjury; finally, that the Government winks at this illicit trade.

The methods of the herring smugglers may be thus succinctly set forth: Undermanned schooners ply from the New England ports to the coast of Newfoundland. There they buy herring of the natives at the legal rate of $1.25 a barrel; these herring are by false affidavits represented as "the product of American fisheries." The more scrupulous perjurers in the trade keep an old net, or even a boat that floats, on the Newfoundland coast. Some even send a sailor to watch the Newfoundlanders draw the herring nets. In these various ways they maintain the fiction that the fish are "taken by American vessels" assisted "by men and nets hired in a foreign port." Generally, however, no attempt is made to keep up the pretence of a fishing industry, and the trade is conducted for what it is—a trade. The loss to our customs is conservatively estimated at upwards of $125,000 a year.

How this open and organized smuggling has become an institution in the protectionist State of Massachusetts it would be interesting to inquire. It will surprise no one that the clause which puts American-caught Newfoundland herring on the free list, is found imbedded in the paragraph on "oils" in the Dingley Act (Sec. 626). But it will be surprising to learn that the winter-herring trade has been for years "protected" at Washington, that the Collector of the Port of Boston was in 1898 virtually reprimanded for enforcing the law in the case of the herring fishermen, and bidden to follow the benevolent "practice of the port of Gloucester." It may seem strange, too, that an easy form of affidavit (omitting the pregnant words of a previous Treasury decision—"fish taken by an American vessel") was supplied by the Treasury Department with a view to avoiding any undue strain upon the consciences of the North Shore and fish freighters. It would be interesting to know why all the political influence of the "banner" protectionist State has been exerted to facilitate the trade in contraband herring—and we suggest that the question be referred to Senator Lodge. Not that we think he knows what his smuggling supporters have been about, but first because he has for years, unwittingly as we must believe, played their game for them; and, second, because he has exceptional opportunities for ascertaining the truth, being able to whiff the contraband herring from his Nahant residence.

Will not some protectionist Senator from a State which has no organized smuggling industry of its own, or, failing that, a Democrat, put the following questions to Senator Lodge:

> "(1.) Why was a special report, ordered by the Treasury in 1896, which thoroughly exposed the fraudulent nature of the winter-herring trade, suppressed and no action taken?
>
> "(2.) Through what influence was the clause 'other articles the products of such fisheries' (*i. e.*, oil fisheries) in the McKinley Bill interpreted by the Treasury to mean herring?
>
> "(3.) Who brought it about that fifty cases begun in 1897 by the United States against 'fishermen' who had presented fraudulent manifests were terminated by an order of nolle prosequi?
>
> "(4.) Why did the Treasury Department in 1898 forbid the Boston Custom-house to enforce United States law, substituting therefor 'the long-established practice of the port of Gloucester'?
>
> "(5.) What reason had the Treasury, in issuing the order of 1898, to assume that Congress had 'full knowledge of the facts' of herring smuggling? Assuming this, why should the Treasury have taken it for granted that a protectionist Congress would wink at a particular kind of smuggling simply because it was 'the practice of the port of Gloucester'?"

If Senator Lodge should answer these questions gladly, the inquirer might be encouraged further to use his Senatorial courtesy and to ask:

> "Should a scholar in politics and a high priest of protectionism let himself be used by a pack of hardy smugglers? And should this same hierophant of the protectionist idea oppose any motion to make the honest import trade easier, until he has made the dishonest import trade in his own State harder?"

There are various ways in which Senator Lodge might answer these questions. He might, for example, draw the red herring of evasion across the trail of honest inquiry. But the most effective way to answer such questions would be to come out strongly for the Hay-Bond treaty, to speak for it, and work for it. This treaty, by removing the duty on Newfoundland herring, would make honest traders of all the herring smugglers in Mr. Lodge's vicinity. It is one of the very rare instances in which virtue may be imposed as by act of Congress, and the opportunity should not be neglected. Furthermore, the Hay-Bond treaty, by offering better bait and port facilities in Newfoundland, will do

much to further the real American fisheries of the Banks. On the contrary, if Senator Lodge and his fellow protectionists defeat the treaty, Newfoundland will undoubtedly retaliate in a way disastrous both to the heroic Banks fishermen and to their thrifty brethren of the winter-herring boats. In view of these facts Senator Lodge should feel that in putting him between the Newfoundland herring and the Newfoundland treaty we have only put him in his proper place, and merely indicated his proper responsibility.

WORKING THROUGH THE FILIPINOS.

So recently was Emilio Aguinaldo a contemptible revolutionist, a ridiculous fugitive, a man who had sold his country for gold and prated of a liberty which he could not understand, that it is surprising to find him now gravely quoted in the Imperialist press as an authority upon things Philippine. Yet this is what the War Department has brought about by giving out his carefully prepared views upon the terrible conditions now prevailing in the archipelago. Not only Mr. Root, but the President, seems to be anxious lest Congress adjourn without appropriating the three millions asked to keep the Filipinos from starvation. The House has not yet concerned itself with the matter. In order to induce Congress to act, therefore, Aguinaldo himself is cited to confirm Gov. Taft's sad picture of the straits to which our Filipino wards are reduced. A "remarkable presentation" is the way the *Tribune* describes Aguinaldo's petition, yet not one whit more remarkable than the fact of its seeing the light of day by grace of the same War Department which, five years ago, had no ears for anything that Aguinaldo or his countrymen might say.

We welcome this action of the War Department as a hopeful sign of a changed attitude on its part towards the Filipinos. The entire country is now in a better frame of mind to judge them and their aspirations fairly. The bitter feelings engendered by a needless and cruel war have begun to disappear, and with them an endless number of misconceptions and misunderstandings. There is an apparently growing desire to work through the Filipinos themselves in our efforts to restore the islands to the state of prosperity in which we found them in 1898. The War Department could, of course, never have intended to lend its sanction to Aguinaldo's intricate scheme for the relief of the suffering islanders. Even were it in sympathy with his particular plan, it would not venture to ask so much of this Congress as a careful and scientific consideration of the whole insular situation. It is rather, we take it, a desire to let Congressmen look at the problem through a Filipino's eyes that has moved Mr. Root to publish Aguinaldo's statement. Such a step would not have been thought of even two years ago. The growing tolerance elsewhere was well illustrated the other evening by Senator Dolliver's remark at a dinner in this city, that "the best thing that we had ever got out of the Philippines was the fact that we were getting out." Surely this utterance of a Republican Senator would have been high treason in 1900.

It is very likely that a perusal of the Philippine Commission's annual report had something to do with the War Department's action. In his summary of the situation as it presented itself on November 1, Gov. Taft bears strong testimony to the Filipinos who have been given high office. "The native governors, on the whole," he says, "have proven to be quite satisfactory. They take great pride in their provinces, and, with the exception of two or three who seem to be listless and fearful of making enemies, they are exerting all their influence, which is very great among the people, to foster industry and law-abiding habits." Gov. Taft believes that it will not be necessary to remove more than two or three. Surely, a people of which this can be said within a year after the cessation of a devastating war, may claim to be well along the road to self-government. Indeed, Gov. Taft's praise recalls the very complimentary things said about the Filipino Congress by John Barrett and other American observers in the summer and fall of 1898.

The work of Filipino officials is praised in other parts of the Philippine report. Of Col. Tecson, recently an insurgent leader and now Governor of Bulacan, it is said that he has organized and led a volunteer force so effectively that his province bids fair to be freer from lawlessness than ever before in its history. For the police of Manila it was found advisable to enlist many prominent insurgent leaders. It is reported now that the present efficiency of the native police is very largely due to the work of these men, against whose appointment there was at first a great outcry from the American press in Manila. As far as the provincial governments are concerned, it would appear that Governor Taft has been eminently justified in putting responsibility upon Filipinos as fast as possible.

In a recent paper read before the British Colonial Institute, Mr. Hugh Clifford called attention to the very great success achieved by the British administrators in the Malay Peninsula. Here a few officers have acquired the confidence of the Sultans, induced them to maintain order, prevailed upon them to use civilized methods of taxation, ended violence and interstate wars, and generally improved conditions, always by working through the natives and not, as in India, by means of a large body of English officials. As the *Spectator* has pointed out, this Malayan plan, which it properly calls the indirect method of governing a subject people, has many advantages. The state careers are left open to the natives; the governing class, as well as the toilers, is improved, and there is no dead level produced by the presence of a class of foreign office-holders. Furthermore, nothing characteristic of the native race is crushed out. This is the only proper way for the United States to do its work of rebuilding in the Philippines, with this distinction, that it should always keep before itself a higher ideal than England has set herself in Malaya or anywhere else—retirement from the archipelago within a very short time. If the War Department and Governor Taft are beginning to plan for the Filipinos along lines like these, their future is one of great promise, despite their present grievous plight.

THE NATION VS. INDIANOLA.

Last Saturday's debate in the Senate served to clear up the point really at issue in the case of the closed post-office at Indianola, Miss. It is only incidentally a question of the civil rights of the negro. Color prejudice and race exclusions enter into the matter merely by a side door. The challenge which the President took up was an unmistakable challenge of the national supremacy. What he had to answer was the question, so sharply put to him, whether he would allow an irresponsible mass-meeting in a small town to dictate to the general Government what Federal appointees, or what class of them, should be allowed to fill Federal offices. Mr. Roosevelt met this covert attempt at nullification, just as President Cleveland met Debs's in 1894 and Lincoln met South Carolina's in 1861, with the round assertion that the discharge of Federal functions depends, in no part of this Union, upon the whim or consent of a locality.

Senator Spooner, speaking for the Administration, left not a vestige of the case that had laboriously been built up by the opponents of the President's action in the premises. They have said that, with fanatic zeal, or with selfish political motives, he has been trying to force upon a respectable and law-abiding community a postmistress who is personally offensive. Nothing of the kind. He has simply refused to be a party to forcing her out of a national office by local intimidation. It has been said that his uncompromising attitude has imperilled the growing good feeling between North and South, and seriously embarrassed those who are laboring for the negro's real good. But to none of those things did the President look. He saw only the national sovereignty impugned. He saw the Constitutional appointing power usurped, or attempted to be usurped, by a body known to no

law, State or National; and he did but his sworn duty in taking the position that a Federal commission must be respected in every part of this country, whether the inhabitants of any particular locality are pleased or displeased.

The essential facts in the Indianola case were put in the Senate debate beyond dispute. Senator McLaurin's version of them did not differ materially from Senator Spooner's. It is agreed on all hands that the postmistress, Mrs. Cox, is an estimable woman personally. She and her husband are well-to-do, owning $10,000 or $15,000 worth of property. She has the respect of the entire community. That is admitted by all. So is it that her conduct of the post-office has been satisfactory. There are absolutely no charges of any kind against her. But a public meeting in Indianola determined that she must be no longer postmistress, and called upon her to resign by a day fixed. Mrs. Cox promised to resign, and did, in fact, soon forward her resignation to Washington; but the President, being fully advised of the facts, and perfectly aware that her action was taken under duress, refused, and still refuses, to accept her forced resignation. Now this woman happens to be colored. But if she were white or yellow or red, Mr. Roosevelt's duty would remain as clear and imperative. He cannot, with due regard to the national dignity or to the Constitution which he has taken an oath to maintain and defend, allow the Federal appointing power to be transferred from President and Senate to a public meeting in a Mississippi town.

Senator McLaurin darkened counsel by many words without wisdom in regard to the right of petition, and the guarantees surrounding peaceable assemblies met to seek redress of grievances. But, granting the grievance—which, in this case, is, confessedly, merely that of a dark skin—to whom was the petition addressed? To any ruler, State or National? To any legislative body whatever? No, but to the postmistress herself. And the particular significance of the "petition" sent to her may best be measured by a resolution introduced at the same public meeting and voted for by a large minority, calling upon a certain Dr. Dudley to leave the town. He was a colored physician who was building up a considerable practice among his own people in Indianola. This was an offence in the eyes of those Southerners who would shut the door of the learned professions to a negro (after boasting that they want to "educate" him) as rigorously as they would public office. At any rate, the hint was enough for Dr. Dudley, and he promptly fled. He knew what was implied in the "petition" addressed to him. It was a thinly veiled threat of ugly consequences to follow if he did not comply. It was precisely the same in Mrs. Cox's case, and she as clearly resigned under threats as did the colored doctor escape for his life. Such outrages upon the private citizen the Government at Washington cannot directly prevent; but if it did not prevent them against its own officers, it would deserve the contempt of all mankind. Once let the principle be established that local prejudice may rightly take upon itself forcibly to vacate a national office, and there is an end of Federal supremacy.

President Roosevelt has chosen an impregnable position. It cannot be carried, and he will not retreat from it. Indianola cannot be allowed to dictate to the United States. This is the simple yet broad issue. "Concede our right to name our postmaster," says the mass meeting in Indianola, "or we will not go to the post-office." "Very well," replies the President of the whole country, "until you submit yourselves to the lawful Federal authority, your post-office will remain closed." That is the whole case. It is not a negro in office, but the national supremacy, that is in question. And surely, the nation with a big N is as properly asserted in its own territory as it is in international diplomacy or throughout the islands of the distant seas. But that is all that President Roosevelt has done. He has simply placed the broad shield of national sovereignty over a member of the Federal Government. The fact that she is a woman, and black, adds to the pathos of the situation, and heightens the chivalrous aspect of the President's act; but the act itself was compelled by the highest considerations of legal and Constitutional right, from which there can be no dissent which does not strike at the heart of the nation's true grandeur.

TAXATION OF MORTGAGES.

In his annual message, Gov. La Follette of Wisconsin makes a long argument in favor of mortgage taxation, and presents nearly all that can be said for that tax. It is an advantage to have all the arguments thus grouped. The advocates of mortgage taxation in this State usually do not care to debate the question. "We know you are right in theory," they declare, when exemption of mortgages is urged upon them, "but our constituents do not understand it, and if we exempted mortgages they would think we were favoring the rich. We appreciate the truth of all you say, but we should not dare to go home and face those who sent us here, if we voted for exemption." Gov. Odell, in advocating a tax of four-tenths of one per cent. on mortgages, takes an equally inconsistent position. A year ago, he declared himself in favor of exempting mortgages. He now endeavors to preserve a formal adherence to that doctrine, while recommending a violation of it. Naturally, no great progress is to be made in that way. Gov. La Follette, however, is evidently sincere in his advocacy of the tax, and he does not lack ability to present the subject as he sees it.

His first point is that mortgages ought to be taxed because, if they are not, capital will invest in them and thus escape taxation. "That vast accumulations of wealth may be invested in interest-bearing securities, insuring large incomes to the holders who throw their share of the expense of maintaining streets, and schools, and public institutions, and all the burdens of municipal and State government upon the owners of factories and shops, and stores, and farms, and homes," he says, "violates every principle of equal rights and equal responsibilities guaranteed to each American citizen." In order to bring the mortgage to the surface, so that it could be assessed, he would have it taxed as an interest in realty, with the provision that if the tax levied is not paid by the owner of the mortgage, it may be paid by the owner of the mortgaged property, and deducted from the amount of the mortgage debt. To avoid the evil of double taxation, he would provide that the owner of the mortgaged real estate should have the valuation of his mortgaged premises reduced by deducting the amount of the mortgage.

Having thus disposed, to his own satisfaction, of two objections—namely, that the tax is practically uncollectible except from mortgages held by the trustees of widows and orphans and dependents, and that a tax on mortgages would constitute double taxation—Gov. La Follette proceeds to consider other criticisms. It is contended, for example, that by agreement or understanding between the maker of the mortgage and the holder, the mortgage tax may be evaded, and rendered a tax on the resources of the borrower. Very well, says the Governor, if this is a danger, make such a contract illegal; prohibit any such agreements. Another objection which he takes up is that the mortgage tax raises the interest rate. "This is disputed," says the Governor, but he fails to say where. Anyhow, he adds:

> "It is unjust to the great body of taxpayers, who are neither lenders nor borrowers, that the hundreds of millions invested in interest-bearing securities should be exempted from taxation in order to establish the lowest possible interest rate. If that is desirable above all things in legislation, it can be attained directly by a law prohibiting the making of a contract for the payment of interest above the desired rate point."

Such is the substance of Gov. La Follette's argument. It may be admitted that he has met some of the objections rather ingeniously; but he certainly has not been able to hide the fact that the tax would be a tax on the borrower, rather than upon the lender. It is all very well to talk about a law prohibiting

an agreement for the payment of the tax by the mortgageor; he would surely pay it in one form or another. The inability of a law to stand between the borrower and the lender is exhibited every day. It was brought out here in court, a year or two ago, that a certain borrower of $30 had paid in the course of time $300 in interest to the lender, and still owed the original $30. Yet there are usury laws upon the statute-books.

The interest rate on mortgages in this city is 4 or 4½ per cent. It is generally agreed that, but for the fact that mortgages may now be taxed as personal property if the assessor is able to find them, the rate would be at least half of one per cent. lower. Yet the legal rate of interest in this State is 6 per cent. It is obvious that a reduction of the legal rate, say, to 5 per cent., the lowest which has ever been seriously proposed in this State, would have no effect whatever on our mortgage-interest rate here. Besides, if the rate of interest could be arbitrarily lowered and the tax on mortgages then imposed, the result would be, not a large revenue and the collection of a tax on "vast accumulations of wealth," but instead, a withdrawal of money from the mortgage market, to the immediate distress of the borrower. Something of this sort, as is well known, is going on here under our present laws. Trustees and other persons who must make public report of their investments, do not place their money in mortgages, for the very reason that, if they do, the personalty tax will be applied. If this menace were taken away, vast sums would enter the mortgage market, to the certain advantage of the borrower.

The fact is, the mortgage tax is in its very nature a tax which must ultimately be paid by the property on which the mortgage is secured. It does not make any difference how many times the circumference of the circle is traversed, it is still the same circle. The machinery which Gov. La Follette proposes would greatly embarrass the borrower, and would render mortgages extremely unpopular with investors; but the property would still pay the tax. It is possible that, by deducting the amount of the mortgage from the valuation, and then taxing the property on its reduced valuation, and also the mortgage, the burden on a given piece of realty might be divided; but, nevertheless, it would all come back on the land, through an increase of the interest rate. This would be the result, despite all the legislative twisting and turning which Gov. La Follette or anybody else could devise. A successful, equitable tax must be simple, direct, and capable of uniform collection. The mortgage tax has none of these qualities. Such mortgage taxation as we have in this State results in flagrant injustice and but little revenue. The sooner it is wholly done away with the better.

OBSERVATIONS IN A BIG UNIVERSITY.

II.

January, 1903.

The educational problems were not the only ones that Agatha found herself studying. Those that concerned themselves with the life of the students on its social side were even more engrossing. Fraternity life, for instance; a woman could spend half of her life thinking about fraternities. It was the girls' fraternities and their workings that especially interested her. The evils of these seemed so great that it was only by holding the alternatives constantly in mind that she could keep from pulling them down. The only alternatives that suggested themselves to her were girls' dormitories and the ordinary boarding-house. To the former she objected as an attribute of the boarding-school, necessarily involving rules and a modification of the liberty of the individual—a step backwards, as it were. The evils of a co-educational boarding-house were too obvious to need defining. Fraternities were, in their initial idea, superior to either of these institutions, and the tendencies she objected to were not incapable of reform.

In the first place, she groaned in spirit over the waste of time and energy for which false ideas of social duties were responsible. None of the fraternities had any independence, but played follow-the-leader in stupid fashion. If the Beta Gammas or the Upsilon Alphas entertained a visiting celebrity, the Iota Sigmas did the same. Agatha often heard the girls in the fraternity she knew best lamenting the necessity of so much entertaining, but they had not strength of mind enough to accept her suggestion that the necessity was a delusion, the result of an inability to think for themselves. Their crowning argument was that they had been invited to more parties than they had given. Consequently, for at least two days, study was entirely suspended. The vast majority of girls were poor, and the fraternities were run on the most economical lines, with insufficient service and table linen, and a careful scrutiny of every penny.

The day of the reception the girls spent running about to their friends, borrowing glass, china, silver, linen, screens, lamps, tables, chairs, rugs, portières and other articles. They searched the gardens and woods for decorations, which they put up themselves. They arranged the tables, made lemonade, and supplemented the cheap caterer-supplied supper in every possible way. They canvassed the porches and hung Japanese lanterns everywhere. They altered, laundered or even made the gowns they were to wear. By the time the guests arrived they were tired out. After a few hours' sleep they woke the next morning to a topsy-turvy house and a whole day's work in the superficial putting of things in order. The borrowed articles were returned. The hasty, insufficient washing of the one Chinese servant had to be supplemented by a more thorough one before the glass, silver or china could be returned. The worst of the litter was cleared away, but the dust and dirt had to wait for Ah Lee's leisure.

O the stupidity, the silliness of it all! Nobody believed in fun for young people more than Agatha; but was this the way to get it? Was the enjoyment of a big reception in any way adequate to the work involved? And on what basis did the fancied obligation to give it rest? The girls took themselves and their social duties too seriously. A girl in college has no social duties, even if she does live in a fraternity. If receptions happened once a year or even once a term, it would be possible to forgive the waste of time involved; but Agatha knew one fraternity in which they gave three entertainments of various kinds in a single week. One girl spent a whole day making dinner cards for a dinner they gave. At first, Agatha was filled so full of righteous indignation that she would go out of her way to avoid meeting the various members; but soon she found herself pitying their ignorant waste of opportunities and misjudgment of values. And yet she grew indignant again at times, especially when a certain fraternity gave parties, knowing as she did that the girls had no fire, even on the coldest days, but studied huddled up in wraps. In the name of the whole university, she resented the gowns that had taken three or four days to make. A poor girl in college has no right to spend time, strength, and money in such ways. It is a sin against the university, it is a sin against every taxpayer in the State, it is a sin against her instructors and her classmates; it is, above all, a sin against herself.

Besides her moral sense, Agatha's taste was offended by their parties. They were not genuine; they were cheap imitations of more expensive entertainments. The guests were offered watery lemonade, dry sandwiches, milky ice cream, doctored coffee, and salad made of inferior materials. In her delicate, kindly way, Agatha tried once to suggest to the girls that they should give to their guests only perfect coffee and perfect sandwiches of various kinds. But no; the Beta Gammas and the Upsilon Alphas always had salad and ice cream at their parties. If she could only have made them see how greatly first-class calico was to be preferred to cheap satin!

This imitating of the standards of people whose means and opportunities were above their reach was to Agatha one of the greatest evils in fraternity life. The standards they set up were not the standards of the girls' own homes; they were not the standards of simple Western life. There was the matter of chaperoning. The chaperon of one of the fraternities told Agatha that when young men were calling, she sat either in the room or in the next room. This was an innovation that Agatha hated to see, though, on thinking the matter over, she had to acknowledge that it was expedient. The girls in co-educational universities, and especially the girls in fraternities, are so open to criticism that it is well to make sure that there is as little to criticise as possible. Agatha regretted this necessity so greatly that she laid it up against fraternity life. Each of these girls would go home with the chaperon fad, which is the exaggeration of the chaperon need, in her head; she would instil it into her younger sisters, into her own children, thus doing her part towards diminishing the glorious freedom of the American girl—a freedom so little abused as to be the marvel of the rest of the world. The freedom of the American girl is a principle as vital to the social life of the nation as the

Monroe Doctrine is to its political life.

Again it was to the doing away with the accredited schools that Agatha looked for the necessary reforms in fraternity life. This would lead to a smaller proportion of purely frivolous girls. They would be of a higher order of mind, and, consequently, more capable of thinking for themselves. Perhaps then there would be enough strength of mind gathered into one fraternity to start a crusade against the abuses of fraternity life. They would decree no parties that involved great preparations or pretence of any kind; no expenditure that was out of keeping with their daily living; nothing that was not simple and informal. They would decide, too, that their time was too valuable to be spent in dressing in their best clothes and making calls with card cases in their hands; they would receive the canon that the duties of a girl to society do not begin until after she leaves college. They would establish the law that their house was to be kept quiet except at certain times; that each member was to respect the work of the others.

The problems that concerned themselves with athletics troubled Agatha little. It was quickly obvious to her, as to any thinking person, that the benefits of athletics were so great that even the abuses of it were to be cheerfully borne. The consequent improvement in the health of the students was the least of these. No individual sacrifices, even where they concerned themselves with life and death, were too costly for a pursuit that had made abstemiousness a manly virtue and had set the fashion of temperance for a whole generation. No other power had ever succeeded in propping up weakness of will or in making the saying of *no* an easy thing. Agatha's father and uncles had gone to college in the old days when drinking, playing pranks, and making love were the only amusements of collegians, when superfluous spirits had to be worked off in such ways as conducting donkeys to the top of steeples; and from their stories she could realize what athletics had done for the moral tone of the college world. In all her life at Westerley, she never but once saw a student drunk.

The much agitated subject of co-education was naturally a great deal in Agatha's mind. Theoretically, she approved of it as a characteristic American institution. It was on a line with development in accordance with such American traditions as were factors in the evolution of that interesting and significant product, the American girl. That she never found herself in absolute sympathy with it in fact was, she decided, because of other modifying forces in the university that had practically no connection with co-education. What seemed to the superficial observer the evils of co-education were actually due to other causes—to the fact that the university was the culmination of the public-school system, to the class from which so many of the students come. The objectionable freedom of manner of many of the boys and girls was not due to their attending the same lectures and studying side by side in the library. Those boys and girls would have the same manners under any conditions. Co-education could never be fairly tested unless boys and girls from the classes that went to Harvard and Bryn Mawr were sent to college together. We had no right to compare the boys and girls that went to a free university with the boys and girls that went to expensive colleges, and then lay the deficiencies at the door of co-education. The advantages of the one class had, generally speaking, been vastly superior to those of the other. And so, when Agatha saw, as she frequently did, relations to be criticised between the boys and girls, she always tried to imagine the individual in his or her native environment, with the result of confirming her in the opinion that co-education is the scapegoat for much that it does not deserve.

Her strongest objection was based on the remembrance of her own feelings, knowing as she did that the boys would have been much more interesting to her than her books; but on the other hand, she always found herself remembering absorbing devotions of her own to various girls in her college days, as well as the numerous love affairs of her friends with the college men whom they met in the vacations. It is a necessity of that age to adore somebody. A certain amount of time and attention would go in dreaming under any circumstances, and no woman of insight would wish to curtail this, with the realization upon her of the limitations of the man or woman who has never been in love. What astonished Agatha, however, was not the extent to which they fell in love, but the apparent ease with which they seemed to keep out of it. She knew numbers of students, both boys and girls, who were apparently heart whole. If they had secret divinities, there were no signs of worship. She marvelled at this, remembering the days when, for stress of feeling, she could neither eat nor sleep.

The stock argument that co-education takes the bloom off a girl, that it "commonizes" her in the eyes of men by destroying the mystery, was always offensive to Agatha, as coming from an unenlightened point of view. If a woman is to be loved and admired in proportion as she is not known, what chance has she for happiness in married life when all mystery is made manifest? Such a theory implies that the mutual relations of men and women are to be intermittent, vague, shadowy. The only safe foundation for happiness in marriage is actual knowledge, and the reverence that rests merely on a delusion is better done away with. If a woman has not that in her that demands reverence, no doubt the deficiency will be discovered in the daily intercourse of the classroom. If the mystery is merely a trick, not an emanation of depth of character, it will surely be exposed. Four years of classroom life give a man a chance to learn to know women such as he seldom gets. Agatha's experience led her to conclude that the question of sex had little influence in the classroom, however much it might have outside. The boys and girls did not seem to meet there as boys and girls, merely as students. Her observation was confirmed by that of other people, though theirs sometimes implied a criticism: co-education would lessen the mutual interest of men and women. This objection was simply funny to Agatha, and set her wondering about the internal mechanism of the people who made it. Was there really any manner of device in heaven or earth that would lessen the all-absorbing mutual interest of men and women?

At all events, in State universities, co-education, as well as size, is a necessity, owing to the excessive cost of equipment to meet modern demands. The question before us now is not whether separate education or smaller institutions are preferable, but what is the best manner of modifying or overcoming the evils due to diversity and size.

ELIZABETH KNIGHT TOMPKINS.

A WINTER EXHIBITION OF LANDSCAPE AT THE ROYAL ACADEMY.

LONDON, January 5, 1903.

The winter exhibition at the Royal Academy comes so near being a triumphant success this year that its failure is the more irritating. The Academicians, unexpectedly lighting upon a good idea, have not known what to do with it. Already, a few years ago, they were faced with the danger of exhausting the supply of old masters in the country, and the consequent necessity of providing some new interest to their winter exhibition. One way out of the difficulty that occurred to them was to rely less upon the splendor of individual pictures than upon the characteristic representation of some one painter, or school, or period; and indeed few plans, if successfully carried out, would be more useful to the student. But they have played with the idea, instead of realizing it seriously and completely as a body of their influence and wealth could and should. One winter they showed incidentally a few pictures by the Barbizon men; another, the work of Fred Walker, Mason, Cecil Lawson—would-be English Romanticists. Last year they got together a superb collection of Claudes, the true foundation of the English school; and the result is that now, when they undertake to make a special representation of English landscape, it is impossible to do more than borrow indiscriminately from different collectors and galleries, and hang without any attempt at order a few fine examples of the great English masters of landscape.

It may be said that if they have done this they have done a great deal, and that one masterpiece counts for more than the most perfect historical sequence and intelligent hanging. True, and, indeed, the glory of the Wilsons and Turners, the Constables, Cotmans, and Cromes in the first two rooms would silence criticism forever if the exhibition began and ended with them. But, unfortunately, its organizers have gone further and aimed at historical sequence. They have endeavored to suggest the foreign inspiration of the English landscape that began, in full perfection, with Wilson; they have endeavored also to follow the fortunes of English landscape down to the present day. Claude, having figured so largely a year ago, could not appear again so soon without an effect of repetition, and, as a substitute, no one better was forthcoming than Cuyp, to whose landscapes, together with a slight sprinkling of his portraits, an entire room is devoted.

Few of the Dutch painters are so tedious as Cuyp. Occasionally, in Amsterdam and at The Hague, one chances upon a picture by him that seems, in its straightforward and honest study of light, to justify his reputation. But it must be confessed that

the average Cuyp is, on the face of it, nothing better than a pot-boiler, and the result of seeing so many together is disastrous. One leaves the gallery more firmly convinced than ever that his famous golden light, his sky—above all, his clouds—are as much studio properties as his cattle and cowherds and cavaliers. Besides, if he influenced any one, it was not Wilson and the succeeding masters, but the English painters who are best forgotten. Some of his "cattle pieces" look like glorified editions of Sydney Cooper, the painter whose great old age made him the popular hero of recent summer Academies, though, now he is dead, he is not thought worthy a place in a winter exhibition of landscape. But when it comes to the moderns who are represented, and upon whom two rooms are wasted, the result is a still worse disaster.

Only four are included, Brett, Henry Moore, Vicat Cole, and Ridley Corbet, and the reason for their inclusion is no sympathy of aims, absolutely no relation to the great masters of the early half of the nineteenth century, but merely the fact that they all happen to have died within recent years. Nor are the steps leading to the degeneracy for which they stand in any way explained in the absence of the men whose works would be so many links in the long chain connecting Wilson with the painters of to-day. How, from Constable, there was ever evolved Vicat Cole, for example, would be hard to understand were it not for a big landscape by Linnell, who came so near being a good painter that one is the more conscious how lamentably he fell short of it. But his "Storm in Harvest," a large and ambitious work, is here, and it explains much. In the distance is a wide, undulating plain under the shadow of the storm, well generalized, with a truth and dignity that suggest careful study of Constable; in the foreground is a corn-field (with figures), which, in all its commonplace detail, would not be unworthy of Vicat Cole. Perhaps it is really because this picture does explain so much that it is banished to the last room of all opened, apparently to no better end than to provide a lodging for the odds and ends that had to be crowded in somehow, out of compliment to the collectors who lent them.

These, then, are the faults of the exhibition: failure in the attempted historical sequence and arrangement, and a preponderance of the work of second and third-rate men that might more profitably have been omitted. The great merit is in the beauty of the paintings by the little group of masters. Wilson, undeniably, was the follower, the student of Claude, but he was the inspired student, and his canvases could well stand the test of comparison to which Turner, though less qualified, exposed his own on the walls of the National Gallery. Wilson, like Claude, always sought and found in nature a certain convention—the convention we now call classical. But it never blinded his eyes to natural beauty, while it taught him the value of expressing this beauty in rhythmical lines and well-balanced masses. And he too helped to "set the sun" in the heavens. The most characteristic of his landscapes now shown is his "Apollo and the Seasons," the figures merely the detail that Claude had already made them, that Corot was to make them later, in a perfect landscape where the lake and its tranquil shores, the hills and inevitable temple, are filled with a glory of light that the experiments, based on chemical truths, of the scientific painter have as yet failed to rival. But Wilson's convention did not mean sacrifice of all character. He could adapt it to his subject so that when, as in "Woburn Abbey," he left the Italy he loved or the land that existed only in his imagination, for a purely English scene, he could still weave his lines into perfect rhythm, make trees and hills part of a well-ordered design, and yet be absolutely true in the English quality of light and atmosphere, the English character of tree forms, wooded slopes, and architecture.

If Turner in his later work was more daringly original, never in his excursions into heretofore untouched problems of light was he at once so accomplished and so really splendid as in the landscapes and marines painted when the conventions inherited from Claude and Wilson kept him within bounds. His masterpieces at the Academy now are his "Harlech," first exhibited in 1799, complete in itself and free from the detail of later pictures that may have meant much to Ruskin but mean nothing in his compositions, serene with the serenity never yet achieved by mere experiment, however clever; and his dramatic "Boats carrying out Anchors and Cables to Dutch Men-of-War in 1665," dating back to 1804, with the wonderful movement of the water, the action of the boat emerging from the very trough of the sea, and the tragedy of nature under the heavy, purple-black canopy of the storm-cloud. It is before pictures like these that one takes off the hat to the master, rather than before the "Modern Italy," into which he strove to paint an entire country on a single canvas, or "The Approach to Venice," which, brilliant as it may once have been, has suffered the fate of so many of his pictures, and is now probably but a pale phantom of itself.

A number of Constables are shown, most of them too well known to call for description. But, no doubt by chance, the two that have become the most familiar through frequent repetition or reproduction have been hung just where they best help to emphasize the weakness and strength of the painter. I have always thought "The Rainbow," more often called "Salisbury Cathedral," the most unsatisfactory of all the large Constables—its foreground overloaded with the detail of the water and the reeded banks, the horse and cart dragged through the stream, the odd figures—while the picture itself, when you finally get beyond the foreground to the cathedral and its surroundings, is involved in composition and disturbed by the glittering dots which were Constable's means for obtaining desired effects of light. The canvas now is close to Wilson's tranquil "Apollo and the Seasons," and to contrast the two landscapes is to realize only what was lost when Constable abandoned convention for a more exact rendering of nature. But then, on the other hand, the most satisfactory of the large Constables is the "Dedham Lock, or the Leaping Horse," and it hangs next to Gainsborough's "Fallen Tree." There are other Gainsboroughs, but I have said nothing of them, for not one quite accounts for his own preference for his landscapes, though I have seen, elsewhere, several that do. As for "The Fallen Tree," it seems in its present place for no better reason than to show what was gained when Constable, throwing over all the old stock-in-trade of the studio—brown tree, ruins, withered branches, and the rest—went straight to nature, where, sometimes, he found a beautiful composition ready-made as at Dedham Lock. Gainsborough's canvas is but a flat, not particularly lovely pattern, compared with this fine, open countryside, bathed in light, enveloped in air, where the wind blows the clouds and masses of foliage into long, beautiful flowing lines, and the figures are in their appointed place, not because tradition required them just there, but because Constable thus saw horse and boy taking the spirited leap, of which he has caught the action and the feeling so marvellously. And, full of incident as the canvas is, the relation of the different passages is so right, the "sparkle with repose" at which Constable aimed is given so perfectly, that the picture both sanctions his ambition as a "natural painter," and preserves the harmonious tone and noble serenity of Wilson's convention. Constable did not often, in his large landscapes, reach this high point of achievement. Directly opposite is his "Opening of Waterloo Bridge," with its restless, overcrowded foreground, and utter failure to render or suggest the majesty of St. Paul's towering over all London in the distance—a picture that goes far to confirm one in a growing doubt as to whether Delacroix and the other Frenchmen did not overestimate the genius of Constable. It is really in his smaller sketches and studies—and a few are here—that he more nearly realized his own high conceptions of the ends and aims of landscape.

What the French Romanticists did was to demonstrate the value of generalization, of concentration, of unity in a landscape. The English painters, even the greatest, were apt to try to put too much into one canvas—far more than one canvas can possibly hold—and this despite Crome's enlightened doctrine of the necessity of "seeing the whole picture at a glance." It is the defect in Cotman's big "St. Malo," which consists of three distinct compositions—the town to the left, the sea to the right, the group of fishing-boats (the ingenious connecting link) in the centre. The eye wanders from one to the other without ever receiving any impression of a pictorial whole. And yet there were times when Cotman, disdaining to make any concession to methods in vogue, did not allow himself to stray from one fine central motive, and then he created the masterpiece; for instance, the noble "Homeward Bound," where the ship that sails toward you from out of the sunset fills the canvas. And what a sunset! Turner, in his sensational skies, sometimes amazes you so by the means that you lose sight of the effect they were to produce. But Cotman lets you see nothing, feel nothing, but the glory of the sombre golden light tinged with flame, out of which his splendid ship comes sailing, laden with romance. This picture is an exception, however. Cotman was far oftener bewildered by light and color, and his "Heath Scene," though well composed, is too hot to be pleasant.

Crome, here certainly, seems more matter-of-fact by Cotman's side, but his two versions of "Mousehold Heath," if not as

masterly as the third in the National Gallery, are so full of the life and animation of nature, so successfully painted "for air and space," so true in the relation of their planes, so brought into unity of aspect, and therefore of tone, by the all-enveloping light and atmosphere, that they make me, at least, wonder more than ever why the great English traditions of landscape should have all but perished in the modern Academical slough of commonplace. Bonington is not particularly well represented. The two surprises of the exhibition are a little romantic woodland scene by Reynolds, the first and only landscape by him I have seen, and a fine stretch of plain and hillside that shows De Wint almost rivalling Wilson in dignity, tranquillity, and sobriety of vision. After this, a few indifferent David Coxes, and one or two large canvases by William Müller, that look like Constables gone mad, bring the collection of landscapes down to the moderns, upon whom space need not be wasted—except, perhaps, to point out that the complete emptiness of Henry Moore's marines, when seen in company with that magnificent Turner, make one appreciate more fully than ever the low standard of the summer Academy, where these same paintings used to seem almost distinguished.

There are other pictures, by old masters, that are not landscapes or marines, but they have the air of having been dragged in to fill up the walls and not disappoint a public that dislikes nothing more than change or innovation in either its winter or summer Academy. The most important are the two large Tintorettos from Hampton Court, the "Nine Muses in Olympus," and "Esther Fainting before Ahasuerus"; and it is interesting to see them where they really can be seen. A Rembrandt, a Rubens, and a Franz Hals, lent by Mr. Pierpont Morgan, are a new argument in favor of the proposal made in the *Nation* recently for a training school for art collectors. The Hals, the portrait of a woman, is the best of the three, and there are fine passages in it; but it shows Hals in his more perfunctory, less animated moments. Some of the portraits by Reynolds, the celebrated Mrs. Pelham feeding her chickens, and the Countess of Powis, are charming. But a couple of Romneys are of indifferent merit, and altogether this part of the collection could have been dispensed with.

More superfluous still—that is, as a section of the regular Academy exhibition—is the series of drawings, photographs, and so on illustrative of Mr. Arthur Evans's excavations in Crete, arranged in a room quite apart. The series is of enormous interest, as every one knows who has followed the researches that have brought the Labyrinth to light. But simply because the series is so interesting, it should not be treated as a mere side-show, which, it may safely be said, the great majority of visitors to the exhibition will never enter. N. N.

Correspondence.

LYNCH LAW ONCE MORE.

To the Editor of The Nation:

Sir: A year ago, on the appearance in the *Atlantic Monthly* of an article in which the originator of lynch law was identified with Charles Lynch of Virginia, I wrote to the author saying that he had not given proof of such identification and asking for further facts. I received a courteous reply, but not the needed proof. About the same time was published the Annual Report of the American Historical Association for 1900, containing a monograph on "Sectionalism and Representation in South Carolina," in which, in reference to the Regulators of 1768, it was stated that "the settlers agreed to rely on lynch law, which received its name at this time" (i. 337). To the author of this monograph I also wrote, saying that I knew of no facts which would lead to such a conclusion, and asking for his authority. From his reply it appeared that the author had relied too implicitly on his memory, and that Gregg, by whom he thought the statement had been made, so far from asserting that the *term* arose during the Regulator movement in South Carolina, had merely said that "they called themselves 'Regulators,' and thus 'Lynch law' had its origin at this period" ('Hist. of the Old Cheraws,' 1867, p. 128). Eight years earlier Dr. R. W. Gibbes had written: "The Regulation, an association of respectable planters, took the matter in hand, and enforced order by a system of Lynch law" (in J. B. O'Neall's 'Biog. Sketches of the Bench and Bar of S. C.,' vol. i., p. x.).

Having, therefore, done something towards relieving both Charles Lynch and South Carolina from the odium of unproved charges, I was somewhat chagrined to find that Gen. McCrady (*Nation*, January 15) had so far misunderstood my previous letter (*Nation*, December 4, 1902) as to speak of my "apparent inclination to find in the action of the Regulators on Lynch's Creek the origin of the term lynch law." In that letter my aim was to give as many facts and as few opinions as possible; and the only personal opinions I was conscious of expressing were: (1) that no one of the conjectures as to the origin of the term "is wholly satisfactory"; (2) that the *Atlantic* writer "assumes but does not prove the connection between Charles Lynch and lynch law"; and (3) that the derivation of the term from Lynch's Creek "has yet to be proved." General McCrady feels quite sure that "nothing to connect the term 'Lynch Law' with that of 'Regulation' or 'Regulators' in Carolina will ever be found." While I hesitate to commit myself so unequivocally, not knowing what future research may yield, yet certainly nothing of the sort has yet been found.

But while it is pleasant to find myself in agreement with General McCrady on this point, one statement made by him cannot be allowed to pass unchallenged. He says: "It is not until 1841, as appears by Mr. Matthews's collection, that the two terms [lynch law and regulator] are found together, and then they are used in regard to affairs in Texas and Arkansas." Space forbade my giving more than a few of the many extracts before me, and naturally those were chosen which best showed the changes in meaning which lynch law had undergone. The terms "regulating" and "regulator," sometimes by themselves and sometimes in connection with lynch law, turn up before 1841.

"These regulators are self-appointed ministers of justice, to punish or destroy those whom the law cannot touch." 1819, Dec. 16, W. Faux, *Memorable Days in America* (1823), p. 318. Faux had spoken on Nov. 26 of "Lynch's law," and was now alluding to "the Rowdies of Kentucky."

"On such occasions therefore, all the quiet and industrious men of a district form themselves into companies, under the name of 'Regulators.' They appoint officers, put themselves under their orders, and bind themselves to assist and stand by each other." 1824, W. N. Blane, *Excursion through the U. S and Canada*, p. 234. Though Blane does not employ the term lynch law, yet he describes the practice.

"No commentator has taken any notice of *Linch's Law;* . . . the citizens formed themselves into a '*regulating company.*' . . . Sometimes the sufferers resorted to courts of justice for remuneration, and there have been instances of heavy damages being recovered of the *regulators.*" 1828, Judge J. Hall, *Letters from the West*, pp. 291, 292.

"The Regulators, as they were called, I have every reason to believe, were an eminently useful race of men, and it may be maintained in most cases, just, withal." 1835, C. J. Latrobe, *Rambler in America* (1836), i. 96. Latrobe is speaking of Kentucky.

In my former letter I merely pointed out that the terms "regulating," "regulation," and "regulator" were in use in the Carolinas in 1768, that illegal whippings were at that time inflicted by the Regulators, and that a meeting of the Regulators took place at Lynch's Creek. Whether there is any historical connection between the Regulators of the Carolinas and the regulators who flourished along the frontiers in and after 1819, is one of the many obscure points in the early history of lynch law which await elucidation. Albert Matthews.

Boston, January 18, 1903.

EDUCATIONAL DIVERSITY.

To the Editor of The Nation:

Sir: In the *Nation* of December 11, I read with much interest an editorial, under the title "Educational Diversity," which seemed to me particularly sound and well-timed. It appears somewhat remarkable that the iconoclasts of late breaking into the midst of our educational ideals and idols of culture should be generally those entrusted with their care, and that, among the protestants most earnest and interested, should be found in the lead those who have been often regarded as the most dangerous enemies of liberal forms of education.

The fact would seem to be that the foremost universities and the most justly famous colleges are yielding too completely to the pressure for a revolutionized curriculum. While it may be true that Greek constituted a "college fetish" when Charles Francis Adams delivered his immortal philippic, it certainly was, and remains, true that Greek constitutes, just as much as in the days of Horace Mann and Francis Wayland, an ideal linguistic and intellectual discipline and a noble source of moral power. For the man of leisure, and for the scholar, it has just as much value as ever, and its importance in the education of these men is quite as great as it was adjudged to be by the greatest educators of the last generation. The same is true of Latin, in its field, with the further argument in its favor that it is an element of fundamental importance in a larger number of educations, as in law, in medicine, and in philology and pedagogy, and in natural science. The need of the day is not that the old

curriculum of the "liberal" education should be abolished, but that the spirit of tolerance which has come so largely to pervade theological spheres should become characteristic of the educational world, and that it should not only be admitted that there are and should be many educations, but also that they should be provided as a part of the system of educations which modern life demands and which the modern state should furnish. We want many new educations; but we need and should sacredly preserve the old—even the "classical." The pendulum is, as usual, swinging too far.

In the view of one who has been a pioneer, and who has surrendered a working lifetime to the promotion of some of the needed new educations, some serious mistakes have been made in the course of this later evolution in education. The giving of A.B. for all courses, and in every form of academic education, seems a radical and unnecessary departure from the older and more logical custom of giving A.B. to the student of the ancient classical course, Ph.B. to the scholar making philosophy his distinguishing work, B.Sc. to the worker in science, and B.L. to the man aspiring to high rank in letters. The pendulum will probably swing back, in time, to its normal arc—an arc suited to the times.

The movement, now so threatening, favoring a two-year or a three-year college curriculum seems another of these extravagant efforts at meeting a demand which is misunderstood by those upon whom the demand is made. Carried to its logical result, it would abolish all college educations because some able and honest business men declare that, for the purpose of money-making simply, the years of college life are less valuable than the same years spent in the shop, the office or the field. They are probably wrong; but, if right, give the ambitious and intellectually strong young man his choice. He will probably choose an education, and will later prove its value and the error of the now favorably received proposition. We are here sending out a hundred young men every year to disprove that fallacy—and they are doing it—in a single branch of professional college work. The college man is often at a disadvantage for a time; but if made of the right stuff, in the end (other things being equal) he usually marches in the van. It is along his chosen line among the various educations now offered by the larger institutions of learning that the poor boy, as always, is more and more frequently finding his way to the front, even in departments of business which are considered least dependent upon learning, scientific or other, for prosperity.

It is unquestionably very desirable that every professional man should also be an "educated" man. In these days he *must* be professionally educated, to succeed. It is also important that he should have as "complete and generous" an education, as Milton would say, as he can afford. But it would be a supreme injustice to assert, and to enforce, the dictum that the man who cannot afford a "liberal" education preliminarily to his professional training, should be forever barred from the profession. That would be a cruel and shameful injustice. It is entirely proper that the acquirement of all the education that time and means permit should be advised every aspirant to professional life; but neither expediency nor justice dictates compulsion or exclusion.

Neither should the course be shortened for all. This latter problem is, in fact, comparatively easy of solution. Let the student, in his A.B. work, elect all the mathematics, the languages, the science, and the special subjects, apart from the professional, that may be properly brought into his course. He will cover a very large fraction of the essential, though non-professional, work of the professional course. He will then secure his A.B. in the usual and proper form and time, and may next obtain his professional degree in two or, at most, three years. We have many men taking this course, and usually securing a reduction of one-third in the length of the normal total college period, and the equivalent, in this respect, of the arrangement proposed by the most radical of advocates of the dwarfing of the A.B. course.

R. H. THURSTON.

ITHACA, N. Y., January 20, 1903.

BROWNING'S NEGLECT OF ENGLISH SCENERY.

TO THE EDITOR OF THE NATION:

SIR: It is somewhat remarkable that so able a critic as Mr. Stopford Brooke, in speaking of Browning's neglect of English scenery, should have overlooked a passage which, for vivid description of that serene and restful beauty so characteristic of "England's best," might alone establish for its author a high rank among "Earth's praisers."

Of the description in "The Inn Album" of an English elm-tree, Mr. Brooke says: "[This] is interesting because it is the third, and only the third, reference to English scenery in the multitude of Browning's verses. The first is in 'Pauline,' the second is that poem, 'O, to be in England,' and this is the third." He then proceeds to quote from "The Inn Album":

"The woman never once has ceased to gaze
On the great elm-tree in the open, posed
Placidly full in front, smooth bole, broad branch,
And leafage one green plenitude of May.
. . . . . bosomful
Of lights and shades, murmurs and silences,
Sun-warmth, dew-coolness—squirrel, bee, and bird,
High, higher, highest, till the blue proclaims
'Leave earth, there's nothing better till next step Heavenward!'"

The passage which Mr. Stopford Brooke has omitted from his enumeration of Browning's tributes to English nature, is, to my mind, the most beautiful of all, and it is found in the same poem. It may well speak for itself:

"So much describes the stuffy little room—
Vulgar, flat, smooth respectability:
Not so the burst of landscape surging in,
Sunrise and all, as he who of the pair
Is, plain enough, the younger personage
Draws sharp the shrieking curtain, sends aloft
The sash, spreads wide and fastens back to wall
Shutter and shutter, shows you England's best.
He leans into a living glory-bath
Of air and light where seems to float and move
The wooded watered country, hill and dale
And steel-bright thread of stream, a-smoke with mist,
A-sparkle with May morning, diamond drift
O' the sun-touched dew. Except the red-roofed patch
Of half a dozen dwellings that, crept close
For hill-side shelter, make the village clump
This inn is perched above to dominate—
Except such sign of human neighborhood
(And this surmised rather than sensible),
There's nothing to disturb absolute peace,
The reign of English nature."

Could any words be chosen more effectively to portray the English landscape? We feel the inrush of light and freshness in contrast with the little stuffy inn-parlor. We lean into the "glory-bath of light and air," and, with the poet, we get such a view of an English landscape that, if we have not forgotten our visits to the mother country, we find ourselves exclaiming, in Browning's own words, "Oh to be in England—in England now!"

Yours respectfully, M. G. M.

BALTIMORE, January 23, 1903.

Notes.

Macmillan's spring announcements include 'A History of the United States since the Civil War,' volume i., by William Garrott Brown; 'A History of the Confederate War,' by George Cary Eggleston; 'The Impeachment and Trial of Andrew Johnson,' by David M. DeWitt; 'A Few of Hamilton's Letters,' selected by Gertrude Atherton; 'Historical Lectures by the Late Lord Acton,' in two volumes; 'Biographical Sketches,' by James Bryce; 'Queen Victoria: A Biography,' by Sidney Lee; 'The Life of Charlotte M. Yonge,' by Christabel R. Coleridge; 'The Life of Sir George Grove,' by C. L. Graves; 'The Life of the Late Lord Bishop of Durham,' by his son, the Rev. Arthur Westcott. From the Cambridge Historical Series we select 'The Colonization of South America,' by E. J. Payne. In the English Men of Letters Series every title is of interest: 'Crabbe,' by Alfred Ainger; 'Jane Austen,' by H. C. Beeching; 'Browning,' by G. K. Chesterton; 'Hobbes,' by Sir Leslie Stephen; 'Lowell,' by Dr. Henry van Dyke; 'Emerson,' by Professor Woodberry; 'Franklin,' by Owen Wister. In this connection belong also the second volume of Prof. William Ridgeway's 'Early Age of Greece,' and Sir James H. Ramsay's 'Angevin Empire: the Reigns of Henry II., Richard I., and John.' Another class opens with Sir Walter Besant's 'London in the Eighteenth Century'; 'Greater Russia,' by Wirt Gerrare; 'Poland,' by George Brandes; 'Letters from the Holy Land,' by Lady Butler (Elizabeth Thompson); 'Quebec: The Place and the People,' by Sir Gilbert Parker; 'The Island of Formosa,' by James W. Davidson, United States Consul there; 'Italy,' by Prof. W. Deecke. From the outing works we take 'Photography for the Sportsman Naturalist,' by W. E. Carlin. 'The Illustrated History of American Art,' to be edited by Prof. John C. Van Dyke, will comprise 'Sculpture,' by Lorado Taft; 'Painting,' by Samuel Isham; and 'Music,' by Louis C. Elson. Our countryman, Dr. Charles Waldstein, will treat of 'Art in the Nineteenth Century.' Drs. Garnett and Gosse's 'Illustrated History of English Literature' will start off with volumes i. (from earliest times to 1500) and iii. (from Milton to Johnson). Add: 'A Lexicon to the Poetical Works of John Milton,' by Laura A. Lockwood, of Wellesley College; 'The Age of Shakspere,' by Thomas Secombe and J. W. Allen; 'The Moral System of Shakspere,' by Prof. Richard G. Moulton; 'Representative English Comedies,' edited by Prof. Charles Mills Gayley of the University of California; 'The Works of Edward FitzGerald,' edited by W. Aldis Wright, in seven volumes, limited to 250 sets (the letters, by the way, arranged in chronological order, and no longer in groups), and sold only by subscription. Finally, we will mention, with the story not half told, 'Heredity and Social Progress,' by Prof. Simon

N. Patten; 'Railway Legislation in the United States,' by Balthasar H. Meyer; 'Custom and Competition,' by Prof. Richard T. Ely; 'A History of American Theories,' by C. Edwards Merriam; a new edition of Prof. Lucy M. Salmon's 'History of the Appointing Power,' with 'History: Suggestions as to its Story and Teaching,' by the same writer; 'Irrigation Institutions: A Discussion of the Economic and Legal Questions Created by the Growth of Irrigated Agriculture in the West,' by Elwood Mead; 'Climatology,' from the German of Prof. Julius Hann; 'The Story of Rome as Greeks and Romans Tell It,' by George Willis Botsford and Lillie Shaw Botsford; 'Happiness: Essays on the Meaning of Life,' by Prof. Carl Hilty of Bern; 'Yesterday's Madness,' a new novel by Alfred Hodder; and 'The People of the Whirlpool,' by the author of 'The Garden of a Commuter's Wife.'

Early in March, Harper & Bros. will have ready Mrs. Humphry Ward's 'Lady Rose's Daughter.'

Little, Brown & Co. have in preparation 'The Indians of the Painted Desert Region,' by George Wharton James.

A handbook, 'Money and Banking,' by Prof. Wm. A. Scott of the University of Wisconsin, designed for educational purposes or for private reading, will be published immediately by Henry Holt & Co.

Forthcoming from the Baker & Taylor Co. are 'Pictorial Composition and the Critical Judgment of Pictures,' by H. R. Poore; 'With the Trees,' by Maud Going; and 'My Woodland Inmates,' by Mrs. Effie Bignell.

'The New America,' a study of the imperial republic, by Beckles Willson, is in the press of E. P. Dutton & Co.

'Among the Palms,' life along the Atlantic Coast, by Nina Larré Duryea, will be issued by J. F. Taylor & Co.

Duckworth & Co., London, invite subscriptions to 'Chelsea Old Church,' by Randall Davies, in a limited edition. It will contain much unrecorded Chelsea history, both of the church and of the principal houses in the old village. There will be thirteen illustrations, including Holbein's drawing of the More family at Chelsea, 1527, now at Basle. The fifth and sixth chapters are given up to More and his property and its subsequent owners for two centuries. Genealogical data abound.

The architectural details of an English village church often yield the most unexpected pleasure. The church at Ickford, diocese of Oxford, is an instance in point. It is very ancient, and an uncommonly fine specimen of the early English work of the beginning of the thirteenth century. The tower is probably unique, with its saddleback roof and very beautiful windows. Unhappily, being in a region hard hit by agricultural depression, this little church is in such woful disrepair that he who would see it must be quick about the matter. Only $2,000 of the $8,500 required to preserve it from collapse have so far been subscribed, although the University of Oxford has been generous, moved, no doubt, by the fact that Archbishop Sheldon, who built the Sheldonian Theatre at Oxford, was once Rector of Ickford. Americans have at least a sentimental interest in the preservation of such beautiful country church models as England still contains. It is therefore worth recording, perhaps, that contributions may be sent to G. Bennett, Esq., Tiddington House, Oxford.

A third, revised edition of Robert S. Barrett's 'Standard Guide to the City of Mexico and Vicinity' is announced by the Modern Mexico Publishing Co. of this city.

There is little change in the twelfth edition of Baedeker's 'Northern Italy,' which reaches us through the Scribners; nor was much change required in this sterling handbook. Here and there the text has been retouched; the latest surmises of the Morellians are duly recorded in the paragraphs on the paintings at Florence, Venice, and Milan; and up-to-dateness again appears in the lines on the fall of the Venetian Campanile. A slight mechanical improvement is the glazing of the thin red covers, which gives stiffness and presumably greater resistance to wear and tear.

With the appearance of the third part of H. Inigo Triggs's 'Formal Gardens in England and Scotland' (London: Batsford; New York: Scribners) that excellent work is brought to completion. As we pointed out in a notice of the first part, the book shows, by means of a series of studies of some of the most complete of the historic gardens remaining in the British Islands, the principle involved in their planning and in their arrangement in relation to the house. The distinguishing note of the book is the admirable series of plans and bird's-eye views of gardens drawn by the author. Collections of photographs of English gardens are now fortunately within the reach of all, but no collection is accompanied by plans which approach in clearness and accuracy those made by Mr. Triggs. The drawings and photographs of the third part are accompanied by text descriptive of the houses and gardens to which the work is devoted. These notes are of sufficient length to bring out whatever is essential to an understanding of the drawings, but they avoid the wearisome historical details which so frequently encumber descriptions of old English houses.

It strikes us that the time and pains spent by Mr. T. F. Thiselton-Dyer in producing 'Royalty in All Ages' (London: John C. Nimmo; New York: Scribners), a collection of anecdotes and gossip of the whims, follies, superstitions, amusements, etc., of royal personages, might, even though the sources drawn upon are accessible and familiar, have been better employed. Still, there are readers who make their literary repasts on the principle favored by Little Jack Horner; and these, no doubt, will find this book entertaining. A little more care in its preparation would not have been amiss. Typographical errors can be saddled, we suppose, on the proof-reader; but such a phrase as "the grace and popularity which marked her early but ill-fated life"; the repeated references to Frederick II. of Prussia as "the Emperor"; the statement that King James's alleged *menu* for the devil's dinner is to be found in his 'Counterblaste,' seem to be mere carelessness. The book is embellished with six handsome etched portraits "from contemporary engravings." We should extremely like to know something more about the contemporary engravings of Edward I. and Edward III.

In 'The Lords Baltimore and the Maryland Palatinate,' by Clayton Colman Hall (Baltimore: John Murphy Co.), originally a series of lectures delivered by request before the Maryland Society of the Colonial Dames of America, we have not only brief biographies of the Proprietaries, but also a succinct history of the Province down to the Revolution. Besides being agreeably written, this work is extremely accurate, the author, with a conscientiousness which we wish were possessed by all writers in this field, having gone to original and authentic sources for his statements of fact, and having no bias or prejudice, religious or other. The only inaccuracy which an attentive reading has discovered is the statement on page 156, that the dispute about the western boundary was settled in 1852. It is true that in that year commissioners from Maryland and Virginia agreed upon a line, but Virginia never ratified their report as the act required, and the question is now in litigation before the Supreme Court. We can commend this little book to all who are interested in our colonial histories.

Mr. E. W. Kemp's 'History for Graded and District Schools' (Ginn & Co.) is a book which follows a somewhat unusual plan. Beginning in a very simple strain with the infancy of the Aryans, it advances from grade to grade until, in the last chapter, which deals with the development of the American nation, it addresses minds of considerable maturity. There are eight grades, and the book seeks to provide for the historical needs of "children from six to about fifteen years of age." Whether a single small volume will supply all the reading that a young enthusiast demands, may be called a doubtful question; but if we once admit that most school children are not enthusiastic historians, another complexion is put upon the matter. Mr. Kemp says: "The effort has been made to present the material in such connection throughout the grades that it would gradually develop in pupils' minds the idea of the *unity of history*, and then finally lead them to feel that history is an unbroken stream of life, of which the present in general and their lives in particular contribute an important part." As might be expected, the picturesque aspects of ancient and mediæval life are those to be chiefly chosen, while from the close of the Crusades colonization and self-government hold the field. Mr. Kemp's book is not only an ingenious experiment, but, placed in the hands of a good teacher, may well be of benefit to those who are so unfortunate as to be driven to the public school for a kind of instruction in history and folklore that the favored gain at their mother's knee.

A pamphlet of sixty-six pages, with a disproportionately long title, gives the result of Dr. J. Geddes's researches into the language and literature of French Canada during the last few years. In spite of ample and accurate bibliographical tabulation, this essay is scanty in comment except in the matter of phonology applied to the determination of pronunciation as heard in various parts of French-speaking Canada; and when we note the phonetic equivalents offered for sounds familiar to those who live in that country, we doubt that the scientific investigator's ear has all the finer delicacy apparently taken for granted. The subject is one concerning which French-Canadians often show a keen, almost morbid, sensitiveness; but a three weeks' wandering about Normandy and Picardy will

speedily convince the competent observer that French as spoken in Canada (sometimes even by educated men) is for the most part *un parler de paysan*. We are further disposed to think that the majority of students have little idea how rapidly the French of towns becomes Angliciżed; the examples suggested in the essay are not nearly exhaustive. The two following, heard recently by the present reviewer, are typical—*sortir*, in the sense of 'to go out into society,' and "Ton *brake* est *jammé*." A stenographer in a public office explained his spelling of a word in the striking barbarism of "J'use une capitale."

Chateaubriand's prose masterpiece suffers no detriment in Mr. Teixeira de Mattos's splendid translation of the concluding volumes of the 'Mémoires d'Outre-Tombe' (Putnams). To render the brilliant color, glow, and rhythmical swing of the original in an English version free from any but the most trifling blemishes, implies not only exceptional bilingualism, but a sense of finer quality in style fully comparable to that of Professor de Sumichrast in his kindred work with Théophile Gautier. The explanatory biographical notes are careful and accurate, if possibly too thickly strewn for the average educated reader, who would willingly dispense with date and fact concerning Tertullian, Brutus, and Silvio Pellico, though he might welcome the suggestion that "Sir Ashwood," mentioned by Président des Brosses as taking part in irreverent ceremonies at Rome in 1740, was no other than the notorious Sir Francis Dashwood, the crony of John Wilkes and the rest of the blaspheming crew of Medmenham Abbey. To Chateaubriand's concluding profession of faith, religious and political, to his championship of ideals followed steadfastly through fortunes good or bad, and to the fervor of his impassioned speech, his present translator has done ample justice.

In two additional volumes of 'Pages Choisies' (Paris: Colin), M. Paul Bonnefou undertakes Beaumarchais, while M. Samuel Rochblave seeks to give an adequate impression of Mme. de Staël in about 300 pages of extract and commentary. With the selections there is little ground for criticism, except that for Beaumarchais's letter on the failure of his "Barbier" we should have preferred the dissertation on sentimental drama, so much more coherent than Diderot's essay on the same subject. The biographical introductions to both volumes are reasonably compact and free from marked partisanship.

To readers familiar with Mr. Bolton King's 'Italy To-day,' the recent sketch of Italian conditions entitled 'Notes sur l'Italie Contemporaine,' by Paul Ghio (Paris: Colin), offers little that is really new, for the two books cover virtually the same ground, profess closely kindred views on a number of questions, and differ chiefly in bulk and fulness. We note that, among the authorities cited by M. Ghio, his predecessor's work fails to occur; and yet Mr. King's book is far from being a negligible quantity. But the more recent writer's socialist sympathies are possibly his most striking characteristic; they lead him to the length of saying that the general strike at Florence in 1902 "a démontré, une fois de plus, la cohésion *morale* qui existe parmi les ouvriers des villes." It is unfortunate that ambiguity should lie in an adjective. In a professedly sketchy work, imperfectly verified statements are bound to occur; yet who will vouch for the assertion (p. 53) that the land in France is "certainement moins fertile" than in Italy? Palmerston held differently.

The sumptuous serial folio edition of 'Amsterdam in the Seventeenth Century,' now in process of publication (The Hague: Van Stockum), has reached its twentieth "aflevering" or division. Besides being a superb typographic triumph, the portraits being especially well reproduced, it gives a very lively picture, in the century of its richest bloom, of the city that rose like Venice out of the waves and mire. In many ways this work is a thesaurus of data for Manhattan origins, and explains much of the thought and real life of the first settlers of New York. The part just issued treats of the religious, literary and artistic side of cosmopolitan and tolerant Amsterdam, in which Jew and Gentile, Papist and Protestant, free-thinker and Anabaptist, found homes and prosperity. Above all other cities, Amsterdam had the Erasmian temper, restrained the violent ecclesiastics of the State church, and welcomed all industrious persons who behaved themselves with ordinary decency. Spinoza, Arminius, Bekker (who put witchcraft to flight), are here represented, together with realistic Jewish and other "interiors," some bearing witness to the commendable system of charities for which Holland was and is noted.

'Osaka and the Exhibition of 1903' is the title of a neat handbook, published by Ichizo Miwa, which sets forth information concerning the fifth national exposition of arts and industry in "the Venice of Japan." After Tokio in 1877, 1881, and 1890, Kioto in 1895 (in celebration of the eleven-hundredth year of its foundation) held such an exhibition. Now, Osaka, always the great commercial centre of the empire, with easy railway communication with all ports and cities, a population of 922,000, and an area of 8.6 square miles, will keep open house from March 1 to July 31, 1903. The site chosen is in the extreme southern section of the city, and close to the theatres and places of amusement. It covers about eighty-one acres. The ten large edifices will be devoted to agriculture, forestry, marine products, industry, machinery, education, fine arts, transportation, live stock, and the aquarium. A special building will be erected for the display of foreign samples. Prince Kanin no Miya is the honorary president. Along with congresses of science, there will be a grand celebration by two thousand Buddhist priests, in full canonicals, of the thirteen-hundredth anniversary of the death of Prince Shotoku, the virtual founder of Japanese Buddhism, and the casting in his honor of a bell, to weigh 89 tons and be 26 feet high and 16 feet in diameter. Much other information concerning places near this historic focus in Japan is given. The little book shows that the Japanese have mastered the art of advertising, and understand "Who's Who."

A tasteful little pamphlet from the Heintzeman Press, Boston, embodies the annual report of the Germanic Museum Association for 1901-2, with views of the Museum itself (the quondam Harvard gymnasium), externally and internally, and of the statue of the Great Elector in Berlin, a full-size cast of which is a portion of Emperor William's gift to this budding institution. A list of the objects already in place and on public view consists of fifteen items or classes, including monuments from Hildesheim, Bamberg, Strassburg, Regensburg, Schleswig, etc. Important additions, the gift of Prince Henry, will arrive in the spring. Meanwhile the directors offer a list of desirable objects in facsimile with prices at which they are procurable annexed, ranging from reproductions of ivory diptychs at four for a dollar, to a cathedral chandelier in gilded copper at $5,000. The enterprise now seems most happily launched, and appeals to the German and the *Kultur* sentiment of the entire country. Professor Francke is the Curator, at Cambridge, Mass.

Earthquake observations and their revelation of the physical nature of the earth's interior and its surface changes are treated luminously by Prof. John Milne in the *Geographical Journal* for January. He estimates that "on the average every year 30,000 earthquakes take place, each of which disturbs from ten up to several hundreds of square miles." One practical value of these observations, made at 38 stations in different parts of the world, is that engineers and builders in earthquake-shaken countries now build to withstand known forces. In Japan, where about 1,000 shocks are recorded every year, the Government maintains at its University "a professor and assistant professor of this subject, whose duties in part consist in giving to students of engineering and architecture a course of instruction bearing upon their future profession." An interesting seismic map of the world accompanies the paper. In some notes on the new boundary between Chile and the Argentine Republic recommended by the Arbitration Tribunal it is stated that, though Chile has gained something in area, this being mainly unprofitable mountain slopes, "the actual extent of the award on either side has no significance." It is believed that the peaceable settlement of the dispute will cause a great increase in the raising of cattle and the production of wool, the farmers having been afraid, from want of a secure title, to invest capital in their holdings.

The principal article in *Petermann's Mitteilungen*, number twelve, is a summary of facts collected from voyagers' narratives from Dampier down in regard to two small islands, still little known, in the Bismarck Archipelago. The other contents are accounts of the physical structure of southeastern Anatolia, of the results of Sverdrup's polar explorations, of the archæological discoveries of Sven Hedin, and of the recent volcanic eruptions in Martinique, with the conclusion of Stavenhagen's history of Russian cartography.

The Baltimore Association for the Promotion of the University Education of Women is prepared to offer a fellowship of the value of $500 for the year 1903-04, available at home or abroad, with a preference for women from Maryland and the South. Applications should be presented before March 30. Blank forms may be had of the President, Miss McLane, No. 1101 North Charles Street.

—A new series of histories for secondary schools (American Book Company) is beginning to appear under the supervision of Prof. A. B. Hart. There are to be four

volumes, and the word "essentials" which occurs in the title of each gives us at once a hint of the editor's idea. We have before us 'Essentials in Ancient History,' by Dr. A. M. Wolfson, and other contributors are to furnish 'Essentials in Mediæval and Modern History,' 'Essentials in English History,' and 'Essentials in American History.' In Professor Hart's words: "The titles of the volumes sufficiently suggest the point of view; the effort will be to bring out the things which have really been significant and vital in the development of the race. Personalities and events, however striking in themselves, which have not had a clear and definite effect in the movement of the world, are omitted in order that, in the brief space available, the essentials may be more clearly presented." Short bibliographies are provided, and sets of topics for review and study also appear at the end of each chapter. We should add that, in the choice of questions, Professor Hart seeks to provide for the needs of those who will read but little outside the text, and of those who are willing to read more at large. Altogether, the scheme shows signs of having been prepared in the light of the most modern pedagogical opinion. The opening volume, which is supplied by Dr. Wolfson, begins with the Egyptians and descends to Charlemagne. It has the virtues of clearness and simplicity, besides being a vehicle of sufficient information. The most striking feature of Dr. Wolfson's treatment is his copious quotation from ancient authors. Snatches from Thucydides and Plutarch, from Livy and Appian, occur at frequent intervals, and introduce an element of pleasing variety. We are particularly glad to welcome any device which aims at the restoration of Plutarch to the place he once filled, but has lost in the last hundred years. The book is illustrated by well-chosen cuts and well-printed maps. The bibliographies, though not extensive, may be called adequate to the purpose. Professor Hart himself will contribute the volume on 'Essentials in American History.'

—The second volume of Mr. J. P. Gordy's 'Political History of the United States' (Holt) merits, in general, the same approbation bestowed on its predecessor. The period covered is the twenty years from 1809 to 1829. The treatment of the important events which fall within these years is not, indeed, very even either in space or in fulness of detail. The account of the embargo and non-intercourse episodes, for example, is especially full and enlightening, while the Missouri Compromise and the beginnings of the slavery controversy are much more lightly touched. Half of the volume is devoted to the six years ending with 1815. We are not wholly clear, either, as to just what Mr. Gordy means by "political" history. Apparently, if we may judge from the volume before us, he means principally the history of what was said and done in Congress. Considerable portions of his book, for example, are filled with little else than summaries of speeches and accounts of proceedings in the Senate and House of Representatives. Doubtless, for the period here dealt with, Congress was the most important centre of political activity, but there were other forces shaping political action into which Mr. Gordy does not much go. Thus, he tells us little about Presidential campaigns, little about State politics, little about the economic and social changes which, in the period after 1815, so radically altered the current of political thought and the course of party politics. Still, an author is entitled to choose his field, so only that he works it thoroughly; and within its limits Mr. Gordy's book is an excellent performance, and one heartily to be recommended. We make but one other general criticism: we think that Mr. Gordy is too severe on the Federalists, and does not sufficiently bring out the reasons for their attitude as a party of opposition. We note that the running-title of the volume is "Political Parties in the United States"—a title which, as applied to the first edition, is said in the preface to have been found to be "inapt."

—'The Power of Taxation, State and Federal, in the United States,' is the subject of a treatise by Frederick N. Judson, published by the F. H. Thomas Law Book Company (St. Louis). The author's aim is to show the limitations of the taxing power of the State and of the Federal Government, as declared and expounded by the Supreme Court of the United States. Decisions of the State courts and inferior Federal courts are cited as applying and illustrating the limitations thus declared. The only book with which it can be readily compared is the now classical work of Judge Cooley; and, as the last edition of that treatise appeared in 1886, Mr. Judson's volume may be considered as being, in some directions, a continuation and supplement of it. For instance, we may find in Cooley the earlier view of a "direct" tax under the Federal Constitution; but to enjoy the illumination shed on the subject by the Supreme Court in the recent income-tax cases, we must go to the pages of Judson. The later author wisely imitates the courts in refusing to discuss the questions which have come up for adjudication in any other light than that of the law. As was observed in the great case of Knowlton vs. Moore, a tax may be a direct tax economically, yet an indirect tax Constitutionally. "No microscopic examination as to the purely economic or theoretical nature of the tax should be indulged in for the purpose of placing it in a category which would invalidate the tax." Indeed, we may venture to go further and say that, under the principles of construction avowed by the Supreme Court, a tax may be a direct tax in fact, and yet an indirect tax in law. An inheritance tax, for instance, is not a direct tax Constitutionally, though no one who ever paid an inheritance tax ever found anything indirect in it. Mr. Judson brings out what, to some minds, have appeared the inconsistencies of these decisions, without attempting to reconcile them with either economic theory or the grovelling facts of everyday life. Mr. Judson's work seems, so far as we have been able to examine it, accurately and well done.

—The fifth volume of Doubleday, Page & Co.'s Variorum and Definitive Edition of the Works of Edward FitzGerald comprises his two dramas after Calderon, viz., "The Mighty Magician" and "Such Stuff as Dreams are Made of," and not only the preface to his 'Polonius' (as in Wright's three-volume edition of the Literary Remains of 1889), but the whole body of that "collection of wise saws and modern instances." This is as it should be, not merely because of the thread of connection which FitzGerald here and there supplies to other men's posies, or the translations and verse which he anonymously intercalates, but because the choice itself is the man. When this warm-hearted recluse twice quotes "Be not solitary, be not idle," who can question that he sought in reading and in composition to observe the precept, however shut out from the world? Twice he holds up plain living and high thinking, which was the mirror of himself; and we recognize both the admirer of Crabbe and the recorder of Suffolk folk phrases in the section on the poor and on the need of happy English laborers and a "bold peasantry" (borrowing here from one of Bewick's moralizing vignettes). Written surely by his own somewhat insular musical hand is the sentence, "One may conceive that Handel is wholesomer for a people than Bellini." "Taste is the feminine of genius," again, is Fitz upon Fitz. And that the two extracts involving references to Voltaire are both slants at him, surely indicates a personal bias. Bacon, Carlyle, Lavater, and Rochefoucauld are conspicuous contributors to this collection; there are two quotations from Tennyson and two even from "Daddy" Wordsworth. From Carlyle nothing is, for FitzGerald, more grimly autobiographic than the extract in confutation of Diderot's cynical view of the marriage covenant: "'Thou makest a vow,' says he, twice or thrice, as if the argument were a clencher—'Thou makest a vow of Eternal constancy under a rock which is even then crumbling away.'" In respect of Bacon, it is interesting to remark the footnote (here on page 203): "And might not a passage like the following make one suppose Shakspere had Bacon in his eye as the original Polonius, if the dates tallied?" This was printed in 1852, and the idea haunted FitzGerald in 1874, when he wrote: "I used to tell Spedding that Polonius was meant for Lord Bacon; but I doubt the Dates won't bear me out." The single extract from Montaigne is taken from a copy in which FitzGerald had inscribed it; but we cannot believe he wrote "une jeune homme," as in line one of page 245; and we apprehend that "q'une" on page 284 is not reprinted faithfully from the Pickering edition. In fact, both the French and the Greek of this volume are sadly in need of revision—which is a pity where all else is sumptuous.

—The strongly Germanic section Lief—Lock of volume vi. of the Oxford English Dictionary (H. Frowde) presents, under Mr. Henry Bradley's editorship, a varied interest. Take the legal term "lien," for example. In England three modes of pronunciation are in vogue, two disyllabic (lee-en and ly-en) and one monosyllabic (leen). This last is allowed to be the prevailing one in the United States. How phonetic spelling-reform would deal with such a case is not obvious. What would it do, again, in the two countries with "lieutenant"? "Leftenant" is all but exclusively heard in England, and all but universally unheard here. The origin of the English pronunciation is perplexing. "The hypothesis of a mere misinterpretation of the graphic form (*u* read as *v*), at first sight plausible, does not accord with the facts," we are told. "Lutenand," "luf-tenand," "leeftenanunt," and "lieutenant," are the

first four forms cited (date, 1375, 1387, 1390). In the compound word "lieutenant-general," by the way, it is remarked that though the second member is historically an adjective, the plural is now formed at the end and not in the middle. The American development of "locate" and "location" is recorded without scorn; it furnishes, in fact, an excellent instance of flexible adaptation to new conditions. In the case of the verb we have the field (and it is a pretty broad field) nearly all to ourselves. The use of the verb "loan" in the sense of 'to lend' is labelled "now chiefly U. S."—emphasis on now—and the quotations show that no Englishman can throw stones at us for that most natural and regular derivation of the verb from the substantive. Mr. Bradley does not tax us with the invention of "loaf," the verb, saying that its origin is obscure, and that Lowell's conjecture that it is connected with the German dialectic *lofen* (*laufen*), 'to run,' is without foundation, that verb not having the alleged sense of 'saunter up and down.' "Loafer" occurs first in Dana's 'Two Years before the Mast,' in 1840, when he styled it "the newly invented Yankee word." "Lobby," of monastic origin as a noun, is another striking instance, in this section of the Dictionary, of American creation and extension in verbal application. England has not disdained to follow after us in this.

—The use of the conjunction "like" for "like as" or "as," which among Americans is either local or the sign of underbreeding, is under the ban in England; yet, as any one may observe and Mr. Bradley points out, is chargeable to "many recent writers of standing." Its evolution is traceable to "an anacoluthic use (somewhat common in the sixteenth century)" exemplified in Spenser's "Like to an Eagle . . . hath spide a Goshauke" (1596). Darwin is the first author quoted (1866) after 1792. The adverbial employment of "lief," principally with "would," "originated chiefly from the misinterpretation of phrases like *I had as lief, I had liever*, in which *would* appears instead of *had* as early as the thirteenth century." Did this misinterpretation proceed from colloquial "'d" (=had, would)? "Literary," in its present acceptation, first turns up in 1749; Dr. Johnson ignored it (1755-1775). To "limber up" is found in Charles Lever in 1843. In the discussion of the suffix "-like," it is remarked how extraordinarily fond the late Philip James Bailey was of words of this formation. More than sixty may be counted in his 'Festus.' The Brahmanic fortune by which words come to express opposed and contrary meanings is shown in the case of "liege," which is both the lord and the vassal. "Lights," like its equivalent "lungs," takes its name from its comparative corporeal weight. "Lift" is to move up into the air (an obsolete "lift" meant 'sky'). "Lobster" and "locust" trace back to the Latin *locusta*, which designated a crustacean before it was transferred to the insect. "Locale" (substantive) for "local" is one of several instances of a pseudo-French ending to preserve the French stress and pronunciation (compare *morale*). We break off with a notice of the superfluous possessive in Mason's and Dixon's line (under Line, p. 307), as the sole quotation shows.

—The Archæological Report for 1901-1902 of the Egypt Exploration Fund contains no account of Professor Petrie's work at Abydos, since the twenty-second volume of the Memoirs of the Fund (Abydos, Part I.), in which a full report was published, is already in the hands of subscribers. The Archæological Survey has been busied chiefly with the making of careful copies of mural paintings in the northern group of tombs at Tell el-Amarna, and specifically in the tomb of Meryra (No. 3 of Lepsius). A volume containing plans, drawings, and photographs of this tomb will be published in the autumn of 1903. The first volume of the Tebtunis papyri has been distributed among the subscribers to the Græco-Roman Branch of the Fund. The most productive new work of this branch, under Messrs. Grenfell and Hunt, has lain among the tombs of the Ptolemaic period at Hîbeh, a town on the east bank of the Nile, well known to travellers by the river steamers on account of its massive walls and palm-sheltered temple ruins from the time of the XXIId dynasty. Here a considerable amount of papyrus cartonnage was obtained from mummy-wrappings of the third century B. C., and has been sent to Oxford for study. The first instalment of these papyri will be published the present year, and promises to be of exceptional interest, containing, besides the two columns of a new comedy, the discovery of which has already been chronicled, a large number of classical fragments, including parts of two new odes of Pindar, and a piece of the lost *Cesti* of Julius Africanus. A Greek sepulchral inscription found on the site, and a number of fragments of papyri of the Roman period exhumed from rubbish heaps, indicate that the Greek name of Hîbeh may be *κώμη Φιλονίκου*. A large number of papyrus documents of about the middle of the first century B. C., both Greek and demotic, were also found in the wrappings of mummied crocodiles at Khamsîn, near Tebtunis. The Report also contains the usual excellent summaries of progress in Egyptology reported from other sources.

LIFE AND LETTERS OF MAX MÜLLER.

The Life and Letters of the Right Honourable Friedrich Max Müller. Edited by his Wife. In two volumes. Longmans, Green & Co. 1902.

The essentially pious character of this collection of familiar letters written and received by Müller would make unnecessary any extended review in the *Nation* were it not that 'Life and Letters' calls in question the correctness of a certain statement made in the *Nation* itself at the time of Müller's death, to the effect that the latter's edition of the Rig Veda, for which he was wont to claim sole credit, was not really his at all, but the work was done by a German scholar, Aufrecht, who was the editor of the *editio prima*, the title claimed by Müller; and that Aufrecht deserves the chief credit for Müller's own edition.

This statement is not so "extraordinary" as is made to appear in 'Life and Letters'; nor does the fact that it was published "anonymously" and "after Müller's death" affect the question, when one considers that it was not very novel, that it made part of an obituary notice, and that such notices in the *Nation* are usually unsigned. Doubtless, however, all adverse criticism seems malicious to friends, and these points, together with the final reproach that the statement emanates from America, require no special comment. The affair is now half a century old, and the reviewer believes that *nil nisi bonum* must yield to *nisi verum* in matters of history. That the Right Honorable F. Max Müller let others do his work for him was, as will appear, privately admitted even by himself. That in public he took the credit, he who runs may read in Müller's popular books. This is the sum of the charge.

The defence in 'Life and Letters' is based partly upon a one-sided statement of the facts, and partly upon a wilful misunderstanding of the indictment. Where the reviewer said that the work for which Müller was wont to claim credit was not really his at all, the defence somewhat disingenuously, or passionately, twice italicizes *all;* and, interpreting this to mean that Müller had absolutely nothing to do with the edition, triumphantly claims that such an allegation is false. But if Kipling is hired to write a poem, and, after doing one stanza, hires some one else to keep on with it, contenting himself with adding the last stanza and examining the whole before it goes to press, the critic is quite justified in saying "this is not Kipling's work at all." Nor is it a sufficient answer to say that Aufrecht's work was "fully recognized." Where is it recognized? If one looks through the prefaces to the various Sanskrit volumes, one may find that Aufrecht's assistance is after a fashion formally acknowledged; but even here it is never stated what was the true relation between the employer and his "secretary." On the contrary, in summing up, in the last volume, Müller, with the usual perfunctory civility of a scholar indebted to his friends, mentions the "advice and active coöperation" of "Aufrecht, Fitz-Edward Hall, and Haug," as if the three stood in the same class in giving assistance; while in the preface to the third volume it is said, in the same way, that much of the correctness and accuracy of the last volumes (*sic*) is due to the co-operation of Aufrecht and the assistance of Wilson. Who could imagine from this that the whole volume had been prepared for him by Aufrecht's own hand?

Yet the reviewer had in mind not so much the formal partial payment made in little-read prefaces of Sanskrit texts, as the lack of all due acknowledgment in works intended for the public. Here it must be repeated very emphatically that, as no adequate acknowledgment of Aufrecht's services was ever made by Müller even in the prefaces to the various Sanskrit volumes, where caution alone made imperative some polite statement, for the general public there was no recognition of Aufrecht's work. In his 'Chips,' for example, Müller does not even mention Aufrecht's assistance, but in the 'Autobiography' he alludes sneeringly to the fact that "another scholar, who had assisted me and had the use of my manuscripts, anticipated part of the last volume of my edition," leaving it to be inferred that some underling assistant had pilfered from him, and that the criminal's name was magnanimously suppressed. "I have received great credit for my edition of the Rig Veda," Müller says in 'Last Essays' (p. 313), "and people wondered at the time how it was done." But he never told them, though the ex-

planation might have been given in one name.

For what are the facts? Müller was hired to bring out the Rig Veda. A part of the work had already been done by Rosen. This part of the text, together with the commentary, Müller brought out without Aufrecht's assistance. But Müller had already grown weary of this scholarly toil. He spoke of it as "slavery," and said that, in his opinion, life was meant for more than the "drudgery of collating manuscripts." So, for part of the next volume and for all of the third volume, he hired Aufrecht to do his work for him, though it was just the work he himself had been hired to do; for a task of this sort is entrusted to a scholar *quâ* scholar, and not to be handed over to his secretary. But, sick of the work he had undertaken, Müller first left the drudgery to Aufrecht, and then, after the latter had got through working for him (first as "secretary" performing the laborious toil of preparing books three, four, five, six, and part of seven, and then as collaborator helping him with books seven and eight), dropped the undertaking in despair, neglecting it for years (his own confession) for more congenial employment. There remained, however, only two books more to do, and since in the meantime Aufrecht had published independently the complete text, including these two books, Müller at last, after a pause of ten years, aided now by younger scholars who had grown up since the work was begun, brought out these books also, with the commentary.* Thus while Weber in ten years published text, Brâhmana, and Sûtra of the Yajur Veda, with sufficient commentary, and did it without parade or assistance, the Rig Veda with its commentary dragged along for thirty years, the vacant interval of ten years beginning the moment Aufrecht stopped working for Müller. The *editio prima* or *princeps* of the complete text was published independently by Aufrecht in 1861-1863. The Müller-Aufrecht edition (with commentary) was published in 1849-1874. In later years, when charged with misappropriation of the title "first edition," Müller's defence was that this referred to the commentary!

But it must not be supposed that an anonymous writer in America was the first to feel troubled at the apportionment of credit due to the editors of the Müller-Aufrecht edition. The warmest friend Müller ever had—his behavior estranged from him all the best Sanskrit scholars of the Continent—was Bunsen, who writes to him thus: "Mögen Sie nur sich nicht abschrecken lassen von dem Versuche, andere für sich arbeiten zu lassen in Handwerkssachen. Sie haben der Sache ja nun Ihr Siegel aufgedrückt." The manual labor thus delicately alluded to was the toil of copying and collating manuscripts, the very work Müller had engaged to do. Bunsen's fatherly advice, given in 1855, at the time the "secretary" was hard at work for Müller, was dutifully followed. Müller let others do his work for him and stamped it with his own seal. "He consoled himself," says a very friendly foreign biographer, "with these words of Bunsen, when he was reproached for letting others do his work." This biographer says in innocent explanation (but without italics): "Müller *had already begun to let others do his work in editing the Rig Veda*, and he must have written to Bunsen that it went against his conscience."

*How Aufrecht's share of the work represents but "one-third," as asserted in 'Life and Letters,' it is difficult to understand. Probably the index is here made to fill the scale for Müller. It takes up the latter half of the last two volumes, but it is no credit to its compiler, being both unintelligently made and incomplete, though Müller assured Bergaigne that it contained every word and form in the Rig Veda!

A GREAT SCHOOLMASTER.

Edward Bowen: A Memoir. By the Rev. the Hon. W. E. Bowen, M.A. Longmans, Green & Co.

The complacent ultra-patriots who assume that the English people are a long way behind us in their interest in education, would do well to take note of the publication of this book, even if they have not the time to read it. Edward Bowen was for forty-two years an assistant master at what we should call a "preparatory" school, and never held any more conspicuous position. Our periodicals are full, almost to the point of weariness, of discussions of educational method, yet what American publisher would think it worth while to issue a memoir recording the career of a man who spent his whole life as a mere teacher of boys?

The important dates in Edward Bowen's life may be given in a few lines. He was born in 1836, the son of an Evangelical clergyman. He went up to Trinity College, Cambridge, in 1854. After winning several undergraduate distinctions, he took his degree in 1858 as fourth classic, and in the following year was elected to a fellowship. During his Cambridge course he was a prominent speaker at the Union Society, of which he became president. In 1859 he went to Harrow as an assistant master. In 1863 he undertook charge of a house. In 1869 he was entrusted by the head, Dr. H. M. Butler, with the organization of a "modern side." At the general election of 1880 he stood unsuccessfully for Hertford against Mr. Arthur Balfour. In 1901 he died suddenly in France while on a cycling tour in company with his old friends, Mr. and Mrs. James Bryce. The memoir, which is written by Edward Bowen's nephew, the son of Lord Bowen, the eminent judge, is supplemented by reprints of a few essays, mainly on educational subjects, and of the school songs which will make their writer's reputation coeval with Harrow itself.

This volume appeals, of course, primarily to Bowen's numerous friends and pupils, who will prize it as refreshing their memory of a personality of unusual power and charm. But it will have a wider value as an authority on the English "public school" system in the second half of the nineteenth century. The pictures here given of Bowen at work—and at play—with his boys afford a clearer insight into the real character of that system than could be obtained from any formal discussion of it. Incidentally, either in the memoir or in the appendices, light is cast upon almost every educational question that is in dispute—the limitations of a master's authority over school games, the permission of "cribs," the most effective means of discipline, the curriculum, etc. Yet even the shrewd judgments pungently expressed on many such subjects are of less worth than the spectacle of the "public school" ideal incarnated in Bowen himself. It is indeed a living picture. We must remember that Bowen's personal qualities were exceptional, but with this reservation his memoir may be commended as perhaps the best guide to the understanding of what is meant by that particular type of education which Harrow represents.

Edward Bowen pooh-hoohed the idea that a schoolmaster could make himself popular by joining the boys in their games. "To play is no more popular in a man than in a boy. To play genially, modestly, good-temperedly, is popular in both; the more so, perhaps, if the player is really worth looking at for his skill, though this is of quite secondary value." Accordingly, he would recommend a master to join in school sports only on condition that the boys liked his doing so, and that he was perfectly sure of keeping his temper. In his own case no hesitation was imposed by either condition. He took his share in the football field until within a few weeks of his death, and as late as his fifty-ninth year saved the game for the Harrow masters, as against the Eton masters, by a supreme effort as a "back." Walking was another favorite pastime. In his youth he once tramped from Cambridge to Oxford in twenty-six consecutive hours, and in later life he went around the entire coast of England and Wales.

As a teacher, he had little faith in the new ideas about professional training, County Council inspection, and the like; and it may indeed be admitted that if all teachers were like Bowen, there would be no need of improvements in the educational mechanism. Of the teacher's function he once said:

> "To convince boys that intellectual growth is noble, and intellectual labor happy, that they are travelling on no purposeless errand, mounting higher every step of the way, and may as truly enjoy the toil that lifts them above their former selves as they enjoy a race or a climb; to help the culture of their minds by every faculty of moral forces, of physical vigor, of memory, of fancy, of humor, of pathos, of banter, that we have ourselves, and lead them to trust in knowledge, to hope for it, to cherish it; this, succeed as it may here and fail there, quickened as it may be by health and sympathy, or deadened by fatigue and disappointment, is a work which has in it most of the elements which life needs to give it zest."

"Zest" was not too strong a word to describe his own relation to his teaching, nor is "enchantment" an exaggeration in depicting its influence on his pupils. "I don't know how it is, sir," it would often be said by a boy to one of Bowen's colleagues, "but if Mr. Bowen takes a lesson he makes you work twice as hard as other masters, but you like it twice as much and you learn far more." He especially possessed, we are told, both the inspiring and the driving powers which separately make so imperfect a teacher, and the combination of which is so rare.

Although a layman—a fact which militated against the proposal to make him head master when Dr. Butler resigned in 1885—Bowen gave religious instruction both to the members of his form and to the boys of his own house. One is surprised to find that more than twenty years ago his pupils were learning the rudiments of Old Testament analysis and separating Genesis into two documents for themselves. At the time of the Colenso panic, Bowen had shown himself, in articles in the *Saturday Review* and elsewhere, an uncompromising advocate of the critical school. A Harrow old

boy, now a distinguished Biblical scholar, testifies that, although Bowen's attitude to Scripture took his breath away at first, "to have begun scientific Biblical study under a teacher always fearless and always reverent has been to me an experience for which I cannot be too thankful." The account given here of Bowen's treatment of the most difficult problems of school ethics is full of suggestion and help to the teaching profession.

His candidature for Parliament is sufficient evidence of Bowen's breadth of outlook. He was a warm supporter of the chief domestic reforms proposed by the Liberal party, and a determined opponent of the Jingoism of Lord Beaconsfield. He hated war and militarism, and the formation of rifle corps in connection with schools provoked his intense aversion. He suffered great distress at the loss of some of his favorite pupils in the Boer war, which he believed to be both unnecessary and unjust. At the same time he was an ardent student of military history. He visited almost every important battlefield in Europe, and in 1870 followed within a few days the line of the French retreat to Wörth. In 1871 he spent his Easter holidays in Paris, which was then under the control of the Commune. Among the appendices of this memoir is the report of a lecture in which he maintained that the common idea of the character of that administration is quite mistaken.

Of Bowen's school songs Dr. Butler truly says that they were possibly his own precious, and assuredly his most enduring, contribution to the life of Harrow, and that they will take no second place among the best lyrics of this order. Even an outsider, with no local sentiment to help him, and without the assistance of John Farmer's music, can scarcely read such verses as "Forty Years On," "Byron Lay," "Queen Elizabeth," and "Giants" without a thrill. It is no disparagement to the skill of the biographer to say that, after all, the most vivid impression of the unique personality of his subject is made by the self-revelation of these school songs. After reading them, we can understand how an old pupil could declare that the tragedy of Bowen's death was not, as often in the case of other men more famous but more ordinary, that he left a great thing undone, but simply that he had ceased to be.

From Grieg to Brahms. By Daniel Gregory Mason. The Outlook Co. Pp. 225.

Five years ago a German named Fuchs wrote a book in which he classified 2,576 composers as neatly as if they had been insects and he an entomologist. Wagner and Brahms were grouped together as fourth-rate, while the fifth class included Chopin and Mascagni, with nineteen others, some of whose names are barely known to the public. Herr Fuchs took himself perfectly seriously; he even threatened to perpetrate a second volume, justifying his wondrous classification; but, so far, this further contribution to comic literature has not appeared on the horizon. One is reminded of Herr Fuchs on perusing Mr. Mason's 'From Grieg to Brahms.' Why this title, since Brahms was born in 1833 and died in 1897, while Grieg was born in 1843 and is still living? The mystery is soon solved. Mr. Mason is not a chronologist, but a classifier *à la* Fuchs, though, to be sure, on a much smaller scale. He selects for biographic and critical treatment the half-dozen composers who, in his opinion, "have done most for music in our day." These are Grieg, Dvorák, Saint-Saëns, César Franck, Tchaikovsky, and Brahms, arranged in an ascending order of importance and merit.

To judge by the bumptious, sophomoric character of the two essays on the "Appreciation" and the "Meaning" of music between which the six critical biographies are sandwiched, the author (who dedicates his book to his uncle, Dr. William Mason) must be quite a young man. His placing Brahms first and Grieg last shows, however, that he is a born musical critic; at any rate, he has the qualities which have always been the distinguishing traits of musical critics—the inability to recognize genius, the mistaking of bigness for greatness, and the ludicrous notion that because modern form is different from the form of Beethoven, it is therefore inferior—in fact, practically no form at all. This has been the shibboleth of German musical criticism, in particular, for long and wearisome decades; in adopting it, Mr. Mason shows himself sadly behind the times—his book is already antiquated. The new spirit of German criticism, which recognizes the right of every genius to create forms of its own, and which does not fancy a painted barrel to be a greater work of art than a Japanese vase simply because it is bigger and "more universal," is exemplified in the two latest histories of nineteenth-century music, Riemann's and Grunsky's, which may be commended to our author's attention.

In a magazine article, Grieg once compared the typical critic to a wet poodle who comes into the parlor and selects the best piece of furniture to lie on. Mr. Mason does this in regard to Grieg's music. He praises the early pieces, written while Grieg was still largely under German influence; but finds little merit or charm in the later compositions, in which the Norwegian has really given us his very best. It is thus that the critics used to praise the early at the expense of the later Wagner, and the drawing-room Chopin at the expense of what Mr. Huneker has happily called the Greater Chopin. It is very wearisome. The fact noted by the author that amateurs adore Grieg and that professionals shrug their shoulders at him, while the reverse is true in regard to Brahms, would have opened Mr. Mason's eyes as to the topsy-turviness of his rank-list had he been familiar with the history of musical genius. Whenever there has been such a disagreement, the amateurs have invariably worsted the professionals.

It is to be greatly regretted that Mr. Mason lacks the insight to appreciate Grieg's peculiar genius, for his book is the only one in our language that has the Norwegian's name in its title; admirers of Grieg who are attracted by that will find it but a misleading guide. Oddly enough, even in the case of Brahms, Mr. Mason does not single out the best of his works for praise. His articles on Dvorák, Saint-Saëns, Franck, and Tchaikovsky are more commendable, although they contain nothing new; but his placing of César Franck ahead not only of Grieg, but of Dvorák and of Saint-Saëns, again reminds of us of our friend Herr Fuchs.

Ohio and her Western Reserve. With a Story of three States, leading to the latter, from Connecticut, by way of Wyoming, its Indian wars and massacre. By Alfred Mathews, Member of the Ohio State Archæological Society, etc. Illustrations and Maps. D. Appleton & Co. 1902.

The leading contention of Mr. Mathews may be stated as follows: Puritanism, which in England had congealed into a frozen creed, in New England continued as ardent as ever, and was engrafted with progressivism. The selected wheat was best winnowed when resown in Connecticut, which, by best working out human liberty and political righteousness, became the most democratic and religious of all colonies, and through all migrations and transmigrations has retained its identity. Her grasp and grip on that part of Pennsylvania which lay within her latitude—authorized by a literal interpretation of her charter—led to an interstate war for fifty years, 1757-1807, as conscientious on both sides as our national civil war, half as comic as an *opéra bouffe*, half so tragic that one of its scenes was an Indian massacre of more victims than at any other in American annals. The squatters, seven times evicted, were adjudged trespassers by the highest authorities, yet their heirs recovered exemplary damages, and their mother State, greedy as Cerberus, secured a sop bigger than herself—the Western Reserve. There, spacious in the possession of dirt, she had free course and has been glorified. Thanks to the Ordinance of 1787, the new departure not only was saved from slavery, but had more than magnetic attractions for those come-outers from every slave State who felt that slavery, if not a crime, was at least a blunder. Accordingly, Ohio was swiftly settled; its limits were made broad owing to political necessities, and it was early an abolition hotbed. Champions of freedom there had ideal routes for underground railroads; and though—or because—sometimes martyred, they had their reward, while their political successors have been most successful in obtaining and retaining offices, downward from the Presidency to the lowest depth.

The points now outlined—Connecticut, born of Massachusetts, having a new birth in its original dominion, militant on the rivers of Pennsylvania and triumphant in the West, not only in the Reserve, but in all Ohio—are the theme of Mr. Mathews, which is treated with energy, eloquence, and plausibility, with provincial prejudice and personal enthusiasm, and will interest many who in not a few particulars cannot agree with the author's views. His story of three States grew out of one address and two magazine papers—indeed, it is largely a rehash of the three—a combination for which the clumsy title-page shows it was hard to devise a name. The speech before the Wyoming Commemorative Association at Wyoming was ideal for its time and place; but all the three sources of the work before us are rhetorical rather than historical in style and make-up—they are the special pleading of an advocate rather than the fruits of judicial impartiality. References to authorities, dates, and exact statements, more and more demanded from the time of Gibbon, are conspicuously absent.

The volume is one of a series called the "Expansion of the Republic," and Con-

necticut's claims overlap those of all its neighbors, West as well as East. They must provoke much damaging criticism, and sometimes be confronted with refutations as complete as the Quaker State, when fairly stirred up, made of the Nutmeg's usurpations of her soil. Massachusetts will maintain that Ohio's debt to Cutler is greater than to any man of Connecticut, and will resent the statements that her children who founded Connecticut were superior to their parents in the township idea, or in churches and schools, either doctrinally or practically; and will compare Connecticut boasting of her improvements to an infant perched on its father's shoulder, and exclaiming, "I am taller than papa!" Vermont will be indignant at the portrait of Ethan Allen, with the statement that Connecticut "sent him into the field." It was not in the name of Connecticut that the surrender of "Ty" was demanded. The Quaker State will hold Franklin as worth more to her than any score of Connecticut interlopers; six-sevenths of Ohio will say that too much is arrogated to their other seventh, the "Connecticut corner." On comparative study, then, something of the glories which have been heaped upon the threefold Connecticut will fare like the jackdaw's plumage in Æsop, until there is a more careful restatement and readjustment of interstate relations, obligations, and contributions.

Euclid: His Life and System. By Thomas Smith, D.D., LL.D. Charles Scribner's Sons. 1902. 12mo, pp. 217.

Dr. Smith's style is light and easy, *plena litteratæ senectutis oratio;* for the author is one who can speak of the quantification of the predicate as a novelty (it was only introduced in 1827), and who, in the words, "In our time, Gauss has shown," etc., refers to a publication of 1801. He has not forgotten his Greek, for he reads Proclus, and he constantly reminds us most winningly of what the education of a gentleman used to be. *Quid enim est jucundius senectute, stipata studiis juventutis?*

The little volume is not intended for scholars, but for those who know no more of Euclid and his science than they learned in the high school; and where the reader's attention may threaten to tire, he is refreshed by something of a facetious turn until he is ready to resume the more serious discourse. One will naturally not expect the author to have the least inkling of the way of thinking of modern mathematicians about the 'Elements.' He treats the "theory of parallels" in the good old way, taking his stand with those who were valiantly resolved to demonstrate that the theorem that the three angles of a plane triangle are equal in sum to two right angles, follows as a necessary consequence from certain premises concerning a plane, although it stared them in the face that these premises are equally true of the surface of a sphere, while the sum of the angles of a spherical triangle exceeds two right angles. Stated in this way, their undertaking was manifestly predestined to eternal failure. One-half of this state of things was clear to the mind of Euclid. That is to say, his confusion of thought about one-half of it arose from two subconscious assumptions, the recognition of which would have made him wholly right. One of these was that space is immeasurably great. That he assumed this appears (among other places) in his supposed proof (I. 16) that the angles of a triangle are not *greater* than two right angles; and that he assumed it irreflectively is shown by the language of his second postulate compared with the use he put it to. It reads that a terminated straight line can be produced continuously (*κατὰ τὸ συνεχές*); but he applies it as if it read "can be prolonged beyond any assigned length." His other unconscious assumption is that all the figures with which he deals are finite. This is shown by his axiom (called the eighth) that the whole is greater than its part. For, of course, Euclid knew well enough that a straight line terminated at one end only, and endless in the further direction, is not made any shorter by cutting off a finite part of it, since what remains can be shoved along to cover the extension occupied by the whole, and, being endless, leaves no part uncovered. These two assumptions not being explicitly made, his proof of the sixteenth proposition which we have just (substantially) quoted, remains imperfect. To prove that the sum of the angles of a plane triangle is not *less* than two right angles, he plainly saw that a special assumption was necessary, and stated this in his fifth postulate (which Professor Smith calls the twelfth axiom) in such a form that it should manifestly appear the matter of fact it really is, and not a matter of pure reason, or an axiom. The whole tribe of old laudators of Euclid (of whom our author is one), though they all but deify him, fail to give him credit for understanding this matter, which they do not understand themselves; but, on the contrary, regard the postulate which proclaims his understanding of it as the greatest blemish upon his work.

This booklet is not intended for people who care to gain a profound understanding of Euclid, or to acquire any minutely accurate information, and therefore small slips are innocuous. But we should deceive our readers if we did not warn them that such slips there are, and thick as leaves in Vallombrosa. For example, we are told in sundry places that Euclid the mathematician was not Euclides "of Megæra." That is true, since that dreadful personage had no Euclid. But neither was our Euclid that eristic philosopher who lived in the town that had come to be called the "Edifices"—Τὰ Μέγαρα, the quantity of which Dr. Smith, with his Greek, will perceive if he thinks of the chatter of Penelope's suitors.

"*μνηστῆρες δ' ὁμάδησαν ἀνὰ μέγαρα σκιόεντα.*"

With singular obliviousness, he says that Alexander survived his master, Aristotle, for a year, although in different places in the book the dates of both deaths are rightly given. It is the same with the mathematical work. On p. 208 he begins an attempted demonstration of a proposition which has been fully proved to be indemonstrable. Here is a bit from which to judge it: "The triangles ABC, BAD have . . . an angle DAC . . . = angle ACB." Now, even without a figure, it is pretty clear that DAC is not an angle either of the triangle ABC or of the triangle BAD. It is no misprint, but a slip that brings the whole demonstration to ruin. Dr. Smith has four triangles, formed by the two diagonals and four sides of the quadrilateral ABCD, and it was requisite to show that the pair of triangles he mentions were equal. He has become confused among the four, has inadvertently substituted a different triangle for one of them, and the whole demonstration is, consequently, a blunder. A "proof," substantially of the same thing (though the author appears not to see that it proves this or nothing), on page 213, is even more plainly inconclusive.

England is the only civilized country where it often happens that an educated man will write a book in which he makes it plain, sometimes even blandly confesses, that he has not taken the trouble to acquaint himself with the most accessible and pertinent facts. We must not blame an individual for following the established customs of his own country, but we are bound to instance at least one case among many in which Professor Smith shows himself the thorough Briton that he is in this respect. There is a considerable account and criticism of Legendre's treatment of parallels, which was certainly called for by the general plan of Professor Smith's book. But this account and criticism is based exclusively on Brewster's translation of Legendre's 'Éléments de Géométrie.' Now Legendre became dissatisfied with his original treatment of the matter, and in his third edition completely revolutionized it. Subsequently, he decided that his new demonstration was invalid, and in his ninth edition returned to the method of Euclid. Still later, he imagined that he had found a way out of the labyrinth, and in the fourteenth (and no doubt in some intermediate editions to which we are unable at this moment to refer) he made a new attempt, very curious and subtle, as it had to be to deceive Legendre, but quite worthless as a proof—namely, he distorts his triangle, so as to make one of the angles smaller and smaller, while the sides are so lengthened that the area of the triangle remains unchanged; and he thinks he proves that this process can go on until, that angle vanishing, all three sides lie in a straight line, *although the area of the triangle remains finite*, and without investigating to what limit the values of the other angles tend. Legendre, in an appendix, gives a still different attempt at a demonstration, which really begs the question, and in one edition is substantially admitted to do so. Of all these changes, Dr. Smith knows nothing, and his criticisms of what he does know of Legendre's work (concerning which two opinions are no longer possible for competent men) admit points that ought to be denied, and deny what ought to be admitted.

A particularly amusing case of writing in complacent consciousness of lacking proper information is a certain speculation about entirely known facts regarding the commentary on Euclid by Campanus—a speculation provoked by a similarly ignorant passage from a certain 'Short History of Mathematics,' which pushes the national custom to a conspicuous eminence. But we cannot give more space to this.

There is much in the volume about the educational value of elementary geometry. In the broad sense that mathematics is good mental discipline, and that modern mathematicians are the only men who reason with precision, we think the author quite right. That is as far as we can go along with him. To judge of the matter

it would be indispensable to inquire how far elementary metric geometry reasons correctly, and whether or not, in rendering its reasoning sound (without which it must be positively mischievous), it would not necessarily become far too difficult for the average boy. There is a way in which, by easy exercises, geometry would gradually develop great logical strength in almost any boy; but it supposes such a revolution in the methods of presentation and of instruction as would be practicable only in a country where teachers were more genuinely educated and had more leisure and stimulus to study than they have in ours. In default of that, the very inferior, but much easier, subject of the theory of numbers affords a far sounder discipline of the logical powers.

Handbook of Birds of the Western United States. By Florence Merriam Bailey. Houghton, Mifflin & Co. 1902.

Bird students have long wanted a comprehensive manual of Western birds that should correspond to Mr. Frank M. Chapman's authoritative and attractive manual of Eastern birds. The book just published by Mrs. Bailey meets the need in a highly satisfactory way. The author records original observations on nearly every page, and she has thoroughly explored the literature of Western birds even down to publications of which the ink is hardly dry. Though the book is in the main a systematic work, it begins with short essays on the migration, the distribution, the economic value, and the protection of birds, and methods of studying them and of preparing specimens. Several local lists and a bibliography complete the introductory matter. The main body of the work takes up systematically every species and subspecies of bird in the United States west of the hundredth meridian. An important feature is the system of keys similar to that employed by Chapman and Ridgway. Illustrations are given for nearly all the birds, many of them from drawings by the best of our bird artists, Mr. Louis Agassiz Fuertes. Some of the other illustrations, particularly those made from photographs of skins, do not quite reach the nicety of execution otherwise uniform in the book.

The keys and the numerous illustrations make the work of identifying birds comparatively easy. Suppose that the student has in his hand a certain bird closely associated "with the fields of dry cornstalks and the smoky, budding wood-lots" of early spring, and with the frosty stubble and sere thickets of autumn. The key shows him, by the character of the bill and the size and position of the hind toe, that the bird belongs to the order of gallinaceous birds. Turning to the special key to that order, he finds that because his bird is without spurs, metallic plumage, and naked head or vaulted tail, it is excluded from the family of turkeys and pheasants, and falls into that of grouse, partridges, and quails, the Tetraonidæ. There are a dozen genera in this family, but a key supplemented by marginal drawings of the diagnostic parts of birds of the different genera is a sufficient guide. Of the two main divisions of the family, this bird belongs, not to the group in which the legs are feathered down to the base of the toes, but to that in which the contrary is true; further, it belongs to the subdivision that has no ruff, thus being separated from the ruffed grouse; still further, it fits into the minor division having the tail more than half as long as the wing, and the claws moderate. Since its head is not crested, however, it is excluded from the group of partridges. There remains for it, then, only the genus Colinus, and because it has a white throat and under parts lightly and irregularly barred, it must be *Colinus virginianus*, the common bob-white. For identifying birds in the field, without specimens, a "field key" is appended to the book.

Under each species the author notes color, measurements, and general structure, distribution, food, and character of nest and eggs, and generally adds an original description of the bird's appearance, habits, and landscape setting. In this last work, which is the most attractive part of the text, Mr. Vernon Bailey has given considerable assistance. The following extracts show the interesting style of the descriptions:

"The magpie is a feature of the landscape, whether seen in flight as a black air-ship, with white side-wheelers and long, black rudder moving against a background of red cliffs in the Garden of the Gods, or seen standing as a lay-figure on a stone wall in a Mormon village. There is always a freedom and largeness about his proceedings. Sometimes he will take wing so near that you see the green gloss on his back, flying with even water-level flight far and away, till he becomes a black dot and disappears beyond your field of vision. His masterful, positive character is not lost even when he goes squacking about his daily business. Whatever he does or says, he claims the attention of the neighborhood, except when he has a secret to hide. . . .

"The road-runner is one of the most original and entertaining of Western birds. The newcomer is amazed when the long-tailed creature darts out of the brush and races the horses down the road, easily keeping ahead as they trot, and, when tired, turns out into the brush and throws his tail over his back to stop himself. Even the oldest inhabitant likes to talk about the swift runner, whom it takes a "right peart cur to catch,' and who eats horned toads, comes to drink and feed with the hens in the dooryard one day, and the next may be hunted vainly in the dense chaparral or cactus where it makes its home." . . .

Hertwig's Manual of Zoölogy.

Translated from the fifth German edition by Prof. J. S. KINGSLEY of Tufts College. 704 pp. 8vo, $3.00 *net.*

Prof. E. B. WILSON, *Columbia University:* "The usefulness of Hertwig's book has long been recognized, and Prof. Kingsley has introduced many improvements that will commend themselves to American zoölogists. It is not improbable that I shall conclude to adopt this work as a text-book."

Prof. C. O. WHITMAN, *University of Chicago:* "I am delighted to see this manual translated by a competent naturalist, and thus placed within the reach of university and college students. It is a most welcome and important addition to the text-books now available, and the translator has done his work well, so far as I am able to judge."

Part First of this work has been translated by Prof. G. M. Field, under the title *General Principles of Zoölogy* ($1.60).

COMING SCRIBNER BOOKS

TO BE PUBLISHED NEXT WEEK

BY THE AUTHOR OF "ART FOR ART'S SAKE"

THE MEANING OF PICTURES

By JOHN C. VAN DYKE

PROFESSOR VAN DYKE'S new volume relates to the substance of pictorial art as his "Art for Art's Sake" did to its technic. It is an explanation of, and a plea for, the beholder's point of view, which he deems as legitimate as that of the artist. He discusses the personal and the decorative elements in a work of art with great fulness and penetration, and he brings out the true significance of painting as he has heretofore explained its modes of expression. Taken together the two works form an original and concise exposition of the philosophy of painting.

$1.25 *net* (postage 10 cents)

CONTENTS

Truth in Painting
Individuality, or the Personal Element
Imagination of the Artist
Pictorial Poetry
The Decorative Quality
Subject in Painting

THE FRENCH REVOLUTION THROUGH AMERICAN IDEAS—A NOVEL.

CALVERT OF STRATHORE

By CARTER GOODLOE

A VERY original and mature piece of work from an entirely new point of view, recreating the life of the American embassy at Paris during the French Revolution.

The great Americans, Jefferson and Morris, move through this dark and adventurous period, illuminating it with their clear intelligences. **With Christy frontispiece in color, $1.50.**

THE AMERICAN COTTON INDUSTRY

A Study of Work and Workers, contributed to the Manchester "Guardian." **By T. M. YOUNG.** With an introduction by Elijah Helm, M.A., Secretary to the Manchester Chamber of Commerce.

A concise, comprehensive and accurate description of the cotton manufacturing industry of this country, the result of a thorough, first-hand study of manufacturing centres in every part of the land, by a broad, practical cotton man seeking information for British use. It constitutes an indispensable handbook for all who wish to know the facts and the figures, as well as the scope, actual condition and real importance of this great industry in America.

ONE WEEK LATER

DEVELOPMENT of MUSLIM THEOLOGY, JURISPRUDENCE AND CONSTITUTIONAL THEORY

(The Semitic Series)

By DUNCAN B. MACDONALD, Professor in Hartford Theological Seminary

PROFESSOR MACDONALD'S book, of which the title sufficiently indicates the broad scope, is destined to prove one of the most valuable of this important series. To the general reader it will open a new world of interest and information, and to the specialist it will give the latest data on its complicated and difficult theme. It is written in a style of very unusual literary brilliancy that appeals to to the reader's imagination in a vivid and effective way, and makes real and living the phenomena that are cursorily familiar to all as the substructure of the "Arabian Nights," but scarcely more so to the general historical student. It is, in a word, the great Moslem world visualized for the first time for modern readers.

CROWELL'S POETS

The Family of William Penn: His Ancestors and Descendants.

By HOWARD M. JENKINS. This work presents the results of a careful collation of known authorities, consultation of the Friends' records in Great Britain and Ireland, and an examination of the Penn Papers in the library of the Historical Society of Pennsylvania. It is a thorough and definitive presentation of the subject, executed with its author's well-known accuracy and thoroughness, and covers a field hardly touched heretofore. *Royal octavo, 300 pages, illustrated with nineteen full-page steel plates, photogravures and half-tones,* **$3.50 net.**

TENNYSON

His Art and Relation to Modern Life

By

STOPFORD A. BROOKE

"Among the many books of note, criticism, appreciation, and eulogy called forth by Tennyson's life and art, this volume by Stopford Brooke is the best that we have read. From the opening sentence of the introduction to the final word of the last chapter the writing is calm, dignified, and crystal clear."—*Independent.*

NOW READY

THE PHYSICAL PAPERS OF HENRY A. ROWLAND

In this volume are collected, not alone Professor Rowland's strictly scientific papers and his public addresses, but also a detailed description of his dividing engine, with plates and photographs.

The subjects treated cover a wide range. In Heat there is the great memoir on the Mechanical Equivalent of Heat, with several shorter articles on Thermometers. In Electricity and Magnetism there are the fundamental researches on Magnetization, on the Magnetic Effect of Electrical Convection, on the value of the Ohm, on the Theory and Use of Alternating Currents, etc. In Light there are the renowned discovery and theory of the Concave Grating and the long series of investigations made in the field of Spectroscopy.

716 pages, royal octavo. Price, $7.50.

Several excellent copies from pictures in the Munich Alte Pinakothek. Address Box 10, care of the *Nation.*

An Educational Directory.

SCHOOL TRUSTEES, PRINCIPALS, TEACHERS, and others interested are invited to consider the advantages offered by *The Nation* as an advertising medium. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters. In its special field of political and literary criticism *The Nation* is unlike any other periodical, American or foreign. Going, as it does, to all the principal libraries, reading-rooms, and clubs, and into thousands of the best homes, addressed to the intelligence of the country, *The Nation* finds its readers able and anxious to secure for their children the best educational advantages.

The advertising rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

Orders may be forwarded through any responsible advertising agency, or directly to

The Nation, 206 to 210 Broadway, N. Y.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 5, 1903.

The Week.

The repeated and disappointing delays in the Venezuelan negotiations, culminating on Monday in news of what is practically a deadlock between Minister Bowen and the allies, are vexing but not necessarily alarming. As we understand the situation, an agreement to refer the whole matter to the Hague Tribunal will be fallen back upon in case the direct intervention of Mr. Bowen, as plenipotentiary of Venezuela, should wholly fail. Chancellor von Bülow, in his speech in the Reichstag of January 20, spoke of President Castro's having "recognized in principle the demands of the three Powers," and having given his "assent to the preliminary conditions for the reference of the dispute to the Court of Arbitration at The Hague." There, we infer, the case will go if no short-cut settlement can be had at Washington. While this is happily true, we think, however, that a review of the whole affair down to the present will not heighten one's idea of the wisdom with which it has been managed by England and Germany. Their new way of collecting old debts, *manu militari*, has not proved a great success, nor is it likely to be followed as a fortunate precedent. Reduced to the ordinary commercial terminology, their plan has been first to destroy a good part of the assets of their debtor, and then to incur such heavy expenses of litigation that they are certain to lose by the whole transaction, no matter what they may be able to recover in the end. If any one says that there was national dignity to be vindicated as well as payments to be exacted, we would ask what evidence there is that English or German national vanity has been flattered by the mortifying incidents of the Venezuelan blockade.

As if to emphasize the blunder of the Anglo-German way of collecting Venezuelan debts, a full account is now given of the success of the French in submitting their claims to arbitration, getting a just award, and having the money in sight. Mr. Bowen was not far wrong in saying that to compel such creditors to come in after those who had plunged into a *bouffe* war would be an "offence to civilization." A trading world cannot afford to put a premium upon violent interruptions of commerce. Indeed, the chief instruction to be had from the whole affair is that peaceful methods of settling international differences are more profitable, as well as more civilized, than an impetuous appeal to arms.

The announcement has been made at Washington that neither President Roosevelt nor Secretary Hay had any agency in adding the monopoly clause to the Cuban treaty, and that neither of them favors it. The clause provides that, during the five years that the treaty remains in force, the United States will not make a treaty with any other foreign country admitting sugar at rates of duty lower than those of the Dingley tariff. This amendment is supposed to be the price demanded by the beet-sugar men for allowing the treaty to be ratified at all. On its face it looks like an additional clause in favor of Cuba which the Cubans did not ask for; but, in fact, it is a clause inserted for a private interest in the United States. It could not fail to be injurious to the consumers of sugar, and embarrassing to the executive branch of the Government in case it should desire to negotiate with other sugar-producing countries. Its most unseemly feature, however, is its gratuitous stab at England, the only friend we had in the war with Spain, and without whose moral assistance in that crisis our difficulties might have been much greater than they were. The British islands in the West Indies are small, and the amount of sugar produced by them is inconsiderable; but they depend upon the American market, and they buy from us as much as they sell to us. We ought not to shut the door of reciprocity in their faces, and we cannot decently do so when we consider the fact that England is not only the best friend we have in Europe, but much the best customer we have in the world.

The vulgar language used in the Senate debate last week about the murder of Father Augustine should not obscure the right and wrong of the discussion. The Democrats were speaking for the honor of the country and the army; the Republicans for a policy of secrecy and suppression, and for connivance at crime. In defending Capt. Brownell against the charge of murdering Father Augustine, Mr. Proctor admitted that he was guilty of the water-cure torture. Alleging mysterious crimes on the part of the priest, Mr. Proctor declared him more guilty than many a man executed by drumhead court-martial in 1861-1865. He had a fit companion in Senator Beveridge. For reasoning, this gentleman substituted pitiful mouthings about defending the army; with calumniations of the men who would punish criminals, whatever their rank or uniform. There is no getting such as he to face the facts: "Do you deny the charges?" "Oh, but you are slandering the army!" "Is it not true that a foul murder was done?" "How can you so vilify the boys in blue?" But if Beveridge and his kind shirked the issue or beclouded it in the interest of the criminals, it must not be forgotten that the War Department admits Capt. Brownell's guilt in the death of Father Augustine. Yet it finds itself unable to act, and Father Augustine's murderers go about without the brand of the criminal.

The annual farce of trying to get the Senate to accept consular reform came to grief in the usual way—the amendment was ruled out on a point of order. Points of order in the Senate, we observe, are valid only against reform measures. The occasion was seized by Senator Beveridge to emit some words —he would call them ideas—on the need of keeping our consular service in a constant state of flux in order to increase its efficiency. His philosophic eye had observed that whenever a consul feels sure of his place, "his energy gives place to indolence," and his "pushing power in the public interest is minimized." Hence the consuls must be in a perpetual "shake-up." This is certainly a novel doctrine of business efficiency. We have no objection, however, to seeing Senator Beveridge's chalice commended to his own lips. He is evidently in need of those "fresh surroundings" which, he says, are so vital to the public servant. He feels too "sure of his place," and, on his own principles, ought to give way to some one else. We should be glad to see him make such a test, in his own person, of his doctrine that a greenhorn is always better than a man of experience.

It is a severe but wholesome rap over the knuckles which President Roosevelt has received in the vote of the Senate Judiciary Committee to reject his nomination of Addicks's man Byrne as District Attorney for Delaware. We have no desire to rub salt into Mr. Roosevelt's wounds. To be held up to the country as less delicately scrupulous about the administration of justice than Senators are, and to be impliedly rebuked, even by the Senate, for his dalliance with the most notorious political corruptionist of the day, constitutes punishment enough. The President must now have his Addicks lesson by heart. It was Mr. Roosevelt's apparent willingness to deal at all with this political pariah, whose touch is contamination, that stunned the decent people of the nation when they first heard of it. He promptly retreated when he found out what public sentiment really was, but held on

to Byrne. Now that the tool of Addicks has proved too much for even the stout Senatorial stomach, the President should withdraw the nomination altogether, and join heartily with the honest men of Delaware in their determined attempt to bury Addicks and all his works.

The House passed last week the Senate bill to increase the salaries of the Federal Judges. Under this act, the Chief Justice of the Supreme Court will receive $13,000, the Associate Justices $12,500, the Circuit Judges $7,000, the District Judges $6,000, the Chief Justice of the Court of Claims $6,500, and Associate Justices $6,000. The Justices of the Supreme Court of the District of Columbia are also to benefit by the bill, as their salaries are made $6,000. It cannot be said that these increases are revolutionary in character. At present the Chief Justice of the United States receives $10,500, and his associates in the Supreme Court $10,000 each. The Circuit and District Judges will gain $1,000, and those of the Court of Claims $1,500, in addition to their present salaries. Any law which makes it possible to obtain better men for these high positions is heartily to be approved. It is impossible to expect, of course, that Federal judicial salaries can of themselves compete with the financial attractions of private practice, but the increases just provided are in keeping with changed financial conditions in the legal profession, and are also warranted by the enlarged business of all the courts concerned. Compared to the $17,500 received by the Supreme Court Justices in this city, none of the salaries can be said to be exorbitant; but these local payments are exceptional and probably unequalled throughout the United States. The dignity and permanence of the Federal positions are still so attractive as to make them the supreme objects of ambition to the legal profession as a whole.

The Washington correspondent of the *Evening Post* epitomizes a report made, but not printed, to the Treasury in 1894 on the subject of the Newfoundland herring fisheries. This report showed, first, that dutiable fish bought in Newfoundland were customarily admitted free of duty at United States custom-houses, although in many cases the statements of the masters of vessels showed that the herring could not have been caught by American fishermen. The loss of revenue for the particular season investigated, that of 1894-5, was $84,000. The investigation has brought out on the part of many United States officials a curious reluctance to interfere with this form of smuggling. In fact, the Treasury, since the report of 1894 was filed, has acted upon it only by way of reversing its own decisions which may have embarrassed this illicit trade, and of making it easier for the alleged fishermen to forswear themselves. Republican politics in Massachusetts, and especially the influence of Gloucester, must be credited with this extension of Republican "protection" to a smuggling industry. It will be apparent that the Massachusetts herring freighters who at present pay no duty, should not oppose the Newfoundland reciprocity treaty, which will merely legitimize a traffic at present irregular. The Treasury has already stretched conscience to the breaking-point for these alleged fishermen and actual importers; and the Senate, when it takes up the Hay-Bond treaty, should not feel that they are entitled to any additional favors.

The blindness of the Treasury Department to the operations of the smugglers of herring on the New England coast is in glaring contrast to its keenness of scent for duties on books imported at New York. Herring caught by Newfoundland fishermen and sold by them to Massachusetts skippers have been admitted free of duty for many years, whereas the importers of books have been paying the legal rates of duty computed on the actual cost of the books in the foreign market. Now, however, the customs service has discovered that in some instances foreign books are sold to American buyers at lower rates than to the home buyers. So the customs authorities raise the invoice value of the imported books, and put a penalty on top of that; but the herring smugglers meet no such difficulties. It makes all the difference in the world whose ox is gored! Of course the appraiser of books at the port of New York is not the appraiser of fish at Gloucester, Mass. Each functionary of the Government must answer for himself at the bar of court, at the bar of history, and at any other bar he frequents. But is it not a curiosity in tariff administration that the Government should show so much greater activity in hunting down honest book-buyers than dishonest smugglers of fish?

Political economy would never have been called "the dismal science" had Secretary Shaw been the only economist. In his address in this city on Thursday Mr. Shaw gave the full-blooded old arguments for protection with an enthusiasm and conviction now rare. He reprehended "school-masters" and free traders for their habit of thinking of the "human race as a unit." Statesmen, on the contrary, must think of "the United States as a unit," and presumably as something quite distinct from the human race. On the subject of tariff revision, Secretary Shaw was equally lucid. He admitted imperfection in the present schedules, but denied that such imperfection called for correction. "Some one, some industry, some interest ought to show an actual hardship, before present conditions are disturbed." A little later Secretary Shaw proved that such "hardship" could arise only through tinkering the tariff, and said very prudently, in the light of previous revisions of the tariff by its friends, that in case of further meddling by the Republicans "no one dare insure against the tariff schedules being made worse." These were words of wisdom. Meanwhile he exhorted his audience to rejoice in their increasing "consumptive power," by which he meant their ability to pay high prices for American-made goods. No one who has recently scrutinized his coal dealer's and butcher's accounts quite wishes congratulation upon the enhancing of his "consumptive capacity." But apparently the West Side Republicans to whom Secretary Shaw spoke are given rather to sentiment than to mathematics; for they were equally edified by his congratulations and by his anti-revisionist Q. E. D.

Two significant events in the educational world are worthy of note—the incorporation in Washington of the General Education Board under an act of Congress, and the decision of the Trustees of the Peabody Fund to work hand in hand with the new organization, so that there shall be no duplication of effort. The General Education Board, in a statement to the public, announces that it is now organized to receive funds and to act as trustee for the disbursement of such sums as may be given it for Southern educational purposes. The Board, like all who have looked into school conditions in the South, is emphatically of the opinion that "no wiser or more patriotic opportunity for philanthropy is before the people of the United States." Mr. Rockefeller has given the Board the sum of $100,000 a year for ten years, but this is only a small part of what is needed, and the Board's appeal should meet with a prompt response from all who are philanthropically inclined. As already stated in these columns, the Board aims to be a general clearing-house and investment headquarters for all who desire to contribute to this worthy cause.

Under the terms of Mr. Peabody's will, the Peabody fund could have been wound up and the principal distributed some five years ago. The trustees wisely decided then to keep up their policy of distributing the income. This method of aiding the institutions which it has helped to support is far more stimulating to them in the way of getting them to help themselves than would be the distribution of the total as an endowment fund for various institutions. Eventually, of course, the Peabody Fund will be distributed, perhaps through the agency of the General Education Board itself. At present, however, the trus-

tees merely seek closer relations with the Board. One action taken by them on Thursday last is significant of the changed conditions in the South since the fund was originally constituted. They voted to found and maintain a "Peabody College for Teachers." Good Southern teachers are among the crying needs of the hour, which both the General Education and Southern Educational Boards have recognized by aiding normal schools and summer schools of instruction for teachers. Such an institution as is planned by the Peabody trustees would make its influence felt throughout the South in a surprisingly short time.

The supporters of the 1,000-ton barge canal have united on a bill which provides for deepening the Erie and Oswego canals to twelve feet and the Champlain Canal to seven feet. It also provides for the necessary widening, and for lengthening of locks so that canalboats of the desired capacity can be accommodated. The route proposed for the main canal from Lake Erie to the Hudson River is that of the present Erie Canal, modified at certain points to make use of the Seneca and Oneida Rivers and a part of Oneida Lake, as well as the Niagara River from Tonawanda to Buffalo. Changes in the route, as a result of which the canal will no longer run through the business centres of Utica, Syracuse, and Rochester, have been made. The estimated cost of all the improvements called for in the bill is $82,000,000. This figure is based upon the carefully prepared statistics contained in the report of State Engineer Bond, whose surveys and estimates were made after the most minute investigation by experts. The total of $82,000,000 includes an allowance of 20 per cent., added by Engineer Bond to all his estimates to cover increased cost of labor and material, and other unexpected or incidental charges. The bill provides, of course, that the whole project shall be submitted to the people at the election next November. The referendum is required by the Constitution. Under the Constitution, bonds for public improvements cannot be issued to run for a longer period than eighteen years, but the Legislature has already adopted a joint resolution proposing an amendment to the Constitution which would permit the bonds to be issued for a fifty-year period. This resolution must be passed by the present Legislature, and the amendment submitted to the people, before the long-term bonds can be authorized; but no doubt the amendment will be adopted if the canal project is.

In this connection it is interesting to note that the Erie canal has still a considerable balance to its credit in its dealings with the State. At the close of the year 1882, at which time tolls were abolished on the canals, the revenues collected by the State on the Erie exceeded all sums paid out upon it for any purpose whatsoever, including original cost, by $42,599,718. This amount, of course, has been reduced by the cost of maintaining and repairing the canal since tolls were abolished, and by the $9,000,000 expenditures authorized in 1895; but in 1899, when the Roosevelt Commission made its report, there was still a balance in favor of the Erie Canal of more than $20,000,000 paid into the State treasury, in excess of the entire cost of the canal from the turn of the first spadeful of earth to the date of the report.

The asserted inferiority of British workmen has been in a measure disproved by a recent building enterprise at Manchester, which also brought out strikingly the superiority of American methods of building. When the Westinghouse Company decided to build a plant at Manchester, the contract was given to Mr. J. C. Stewart, who accomplished the work in something like half the time estimated by British contractors. Mr. Stewart, however, worked entirely with English sub-contractors and laborers, and his success was due largely to his energy in keeping various shifts always at work on the building, and in offering a handsome increase of wages for all work done over-time. A similar demonstration followed in the same city in the case of the terminal hotel of the Midland Railway, the largest in Great Britain outside London, the construction of which is, in eight months, as far advanced as it was to have been in twelve. It will be finished in a little more than a year, though two was the smallest estimate of the British experts. These two instances of rapid building have attracted much attention in England, and are viewed with something of that mixture of admiration and disquietude which greeted the shipping of the Atbara bridge from American forges to the upper Nile.

It is at once an implied compliment to the United States, and a noteworthy sign of the times, that a strong movement for revising the French Constitution is on foot, with the aim of giving the Court of Cassation powers equivalent to those of our Supreme Court. France has had no such judicial check on unconstitutional legislation, or violation of the rights of the private citizen by act of Parliament. Like the Commons of England, the French Chamber has had full power to pass what laws it pleased, with no judge to say it nay. How small a part the judiciary plays in the political institutions of France may be seen in Mr. Bodley's 'France,' in which not so much as a single chapter—apparently not a full page—is devoted to the subject. Compare the many pages which Mr. Bryce surrenders to a study of American courts in reference to our Constitution and lawmaking. That thoughtful Frenchmen should perceive the need of some norm of legislation and of an independent court to apply it as a test to the enactments of the Parliament, suggests once more that deep instinct of conservatism in the French political character which survives so many startling changes and radical proposals.

Austria and Russia have now joined Germany and France in adopting higher tariff duties as against all countries which do not give them favorable commercial treatment. This is the very news that Senator Lodge was in search of the other day. Could it be, he asked in a pained resolution, that any country on earth was preparing to enact high customs duties against the United States? Well, all the leading nations, except England, appear to be getting ready to do that very thing. And we fear that they will only laugh if our Senate attempts to play the rôle of injured innocence. That Senate, which is the foster-mother of the highest of high tariffs, which secretly strangles to death every reciprocity treaty that is sent to it, is surely not in a position to cry bloody murder when others execute the villany it has taught them. For Uncle Sam to exclaim in horror at the sin of protective tariffs in *other* countries, is certainly to make the old gentleman unnecessarily ridiculous.

Reports of massacre and even worse outrages in Macedonia emphasize the need of European intervention, and cast grave doubt upon the efficacy of the joint proposals of Austria and Russia recently made to the Porte. The plan formulated by Count Lamsdorf after his recent trip through the Balkans has, in fact, this weakness, that it seems to benefit only the Christian subjects of Turkey. Accordingly it bears the look of unwarrantable coercion at Constantinople. The Sultan may agree to it as he has done to many other plans of reform; but that he will carry it out faithfully nobody believes. A correspondent of the London *Times* has lately pointed out a principle heretofore strangely overlooked, that reform in Turkey must comprehend the Muslims as well as the Christians. This the Russo-Austrian proposal of schools and a gendarmery officered by Christians fails to do, and daily infliction of atrocities on the Macedonian Christians may be accepted as the real answer of the Porte, whatever its diplomatic reply may be. The present disorders are probably only an earnest of those that will ensue with the coming of spring. Then it will be seen whether Russia still has such a hold over the Macedonian revolutionary committees as to postpone again a settlement which must soon be made—even at the risk of repeating the history of 1877-8.

THE NEW SILVER MOVEMENT.

President Roosevelt has asked Congress to give him power to lend the support of the United States to "such measures as will tend to restore and maintain a fixed relationship between the moneys of the gold-standard countries and the silver-using countries." This authority is asked without any suggestion, and apparently without knowledge, of the fact that a large part of our political and diplomatic activity during the past quarter of a century had been directed to that very problem—the problem, namely, how to cause two things to be of equal value when they are of unequal value. This was the underlying question in three international monetary conferences, and also in the Wolcott Commission of 1897.

The resemblance of the latter to the plan now recommended by the President, if we may judge from the accompanying documents, is rather striking. Mr. Wolcott and his colleagues went to England not expecting to bring about any change in the monetary standard of the United Kingdom, but to induce her to lend India to some experiment for supporting the price of silver. The Salisbury Ministry, being little skilled in the subject, and having very imperfect knowledge of the state of public opinion in either India or England, assented to the project, stipulating, however, that the single gold standard should be maintained in the United Kingdom, and stipulating also that both the United States and France should open their mints to the free coinage of silver at the ratio of 15½ to 1. On those conditions Lord Salisbury, in the innocence of his heart and the paucity of his knowledge, agreed to recommend that the Government of India should reopen its mints to the free coinage of silver, and that the Bank of England should keep silver in its vaults to the extent of one-fifth of its metallic reserve. When these facts were fully made known, there was such an overwhelming protest of public opinion in both England and India against it that Lord Salisbury was obliged to say that he could not go on with the negotiation. It was a mortifying failure.

Yet the Wolcott Commission had a much more promising start than any which could be set on foot now to accomplish the like task. That task, as we have said, is to make two unequal things equal to each other. It is so declared in the papers submitted with the President's message. The joint communication of the Ministers of Mexico and China presents their wish in these words:

> "It is desired that the Governments of gold-standard countries having dependencies where silver is used, and the Governments of silver countries shall coöperate in formulating some plan for establishing a definite relationship between their gold and silver moneys, and shall take proper measures to maintain such relationship."

"Definite relationship between their gold and silver moneys" means holding the values of the two kinds of money at a parity. This may be done by one country for itself alone. Indeed, it is done by the United States at this moment. It is done by limiting the amount of silver money to the needs of retail trade, and compelling its use in such trade by abolishing other money of small denominations. But how this is to be done internationally—that is, by concert of action between a number of countries—we defy anybody to point out. The attempt to accomplish this end in the four or five countries of the Latin Union was a total failure. As soon as a divergence took place between the legal ratio and the market ratio of gold and silver, the cry of *sauve qui peut* was raised, and each of the countries concerned made haste to stop the coinage of silver. France limited her coinage secretly in 1873, openly in 1874, and stopped it altogether in 1876. The other countries were glad to escape in the same way from the agreement they had made to establish "a definite relationship between their gold and silver moneys."

Yet there was a much better opportunity to carry out this scheme in the case of the Latin Union than in the one now mooted in Washington. The Latin Union countries had a common currency at the start. They began with a legal ratio that was coincident with the market ratio. They were adjoining countries territorially, and they were, in point of intelligence, the equals of any nations in the world. They were not the colonies of any other countries, and hence were not obliged to take their decisions from distant masters whose action they could not anticipate. How different are the conditions of the peoples which it is now sought to link together in a monetary union. In the first place, the legal ratio which they wish to establish is that of 32 to 1, whereas the market ratio is far different, and fluctuating violently. The countries concerned are certainly not of a high range of intelligence, and only one of them can be properly called self-governing. Mexico is, in a sense, self-governing—that is, government is not imposed from without—but China can hardly be called such. The Philippines are governed at Washington, the Straits Settlements at London, and Tonquin at Paris. A monetary union to be made of such a hotch-potch is inconceivable. We have had one foretaste of its difficulties in the disagreement at Washington on the Philippine Currency Bill of last session and again in the present session. The new movement will amount to nothing except the salaries and expenses of the commissioners. Meanwhile, it will revive in this country the obfuscation and perversity on the subject of bimetallism for which we have paid, and are still paying, so dear.

The House Democrats voted, the other day, in favor of the gold standard for the Philippines, and all the Republicans, except the financial leaders, voted against it. That the "limping standard" bill proposed by the House Philippine Committee, and which was voted down by the House, was a part of the larger silver project brought forward by the Mexican and Chinese Ministers in Washington, appears from the fact that it is referred to in their communication to our Government under date of January 15. The House had not then taken action on the Philippine Currency Bill, but the Ministers of those two Governments said in their communication: "One such plan has already been proposed in both houses of the Congress of the United States with reference to the Philippine Islands." These Ministers do not call upon us to "*materially* change our currency system," but they hope that something may be done through our treatment of subsidiary coinage to bolster up the price of silver. Now, the only way we can do this is by resuming the purchase of silver bullion, whereas we have enough silver on hand to supply our wants for subsidiary coinage for a hundred years. Would it not add zest to the political campaign next year if the Republicans should be the party "bulling silver" and the Democrats should be contending for the single gold standard?

THE POWER OF THE SENATE.

"They [the Senators] call the offices *their* offices, not the country's offices; and the power of nomination *their* power, not the President's," says Mr. Henry Loomis Nelson in an interesting article in the *Century Magazine* on "The Overshadowing Senate." He shows very clearly how the increasing and dangerous power of "the Senate trade union" depends upon the right of vetoing Federal appointments. It is this control over the offices that makes every treaty and every administrative bill stand or fall by the bargain which the President can drive with the Senate—a bargain in which the advantage is always with the Senate; and it is again this power over the patronage that almost inevitably renders the Senators of a State its political bosses also; this gives them, too, power of political life and death over the Representatives. Thus the Senate has, on the one hand, the President by the throat, and on the other the lower house individually under its thumb; and it would be no great exaggeration to say that it lies with half a dozen of the older Senators to block any useful law or just treaty.

It is needless to say that the framers of the Constitution never intended to vest such power in the Senate. They imagined it not the virtual appointing power, but a reserve check upon a pos-

sibly corrupt or inefficient President; not the treaty-making power, but simply the guarantor of a reasonable publicity and consultation in all foreign affairs; not the preponderating force in legislation, but one coördinate with the House of Representatives. Very likely the Federalists who shaped the Constitution foresaw and deliberately provided for a certain preponderancy of the "upper house." They must have seen that the long term of office, indirect election, and compactness of the Senate, meant stability and consequently influence. What they apparently did not foresee was that, while the Senate was to serve as a check upon the Executive and the popular house of Congress, and even, through the power of confirmation, upon the national judiciary, no effective check upon the Senate had been provided. At this point, apparently, the wise distrust in political human nature which had everywhere else actuated the fathers failed, and they planned a Senate as if there were never to be a Quay or an Aldrich, a Hanna or a Platt.

The exaggerated power of the Senate, as Mr. Nelson has very strikingly shown, comes from a silent conspiracy, which has only of late years been perfected, for the control of Federal appointments and of bills which favor a particular locality. It has come to be unwritten law that the majority party in the Senate will refuse to confirm an appointment to a Federal office in a given State if it be opposed by their party colleagues, the Senators from that State. The "system," as one would call it in speaking of the New York Police Department, has indeed a deplorable similarity to the "all for one and one for all" principle upon which police plunder was distributed in this city.

Of course, no reform of the Senate is likely to come about short of breaking this silent compact for patronage. This should not be a hopeless task, for the compact itself, in its present elaborated form, is of recent growth. Four or five fearless Senators could do much to shatter the unholy alliance. If even two Senators from a single State, realizing how petty and unworthy is this dealing in offices, would break the agreement and expose fearlessly every unjustified hold-up of a Presidential appointment, they would make the Senate chamber temporarily uncomfortable for themselves, but they would undoubtedly make it more uncomfortable for the "Senate trade union." An appeal to the Senate to drop pettifogging and small trading would be simply an appeal to reason, and it will always be in the power of a handful of generous statesmen to establish such an apostolic succession of statesmanship as now exists of office-broking.

The difficulty about reform from within is that it is increasingly harder for high-minded statesmen to pass into the Senate. That body, under the present conditions, draws to itself chiefly the more presentable bosses and the mediocre sort of successful business men who fill the party chest and do the boss's bidding—"wealth unguided and uninformed, untempered by a patriotic and statesmanlike regard for the general welfare." When the real power of the Senate oligarchy is fully understood by the plain people, we shall probably have a Constitutional amendment and popular election of Senators. This will be no sovereign remedy for the ills we have spoken of, but it should at least improve the personnel of the Senate. Under such a system a Platt would have to present himself to the scrutiny of his unbought fellow-citizens. He could not slip back to the Senate through the perfunctory and joyless vote of the creatures whom he had made. Until this unquestionably remote and difficult measure of reform be attained, our hope must be first in better leadership in the House, in courage on the part of the President which shall make him say plainly "Thou art the man" to a Senator who wilfully opposes a fit appointment, a needful bill, or a just treaty; finally, in such concentration of public opinion upon the Senate that it shall be afraid to use wantonly the power it has acquired almost by chance. The preponderancy of the Senate, which carries with it certain advantages, will be in every way less alarming when it is more fully realized. Hence, the present duty of the press is to bring home on all occasions Senatorial responsibility for wrongdoing.

AUTHOR-CONGRESSMEN.

Adam Smith had a low opinion of the business capacity of authors as a class, but he never encountered the author-Congressman. When that member of the irritable genus drops into literature, he is apt to display a skill and a fertility of method which can only leave the ordinary writer wondering why he had never thought of such schemes, and whether he could bring himself to adopt them if he had. Gen. Grosvenor, whose unhappy attempt to write history instead of making it is just now exciting a good deal of unfeeling hilarity, might well have alleged illustrious precedents. Benton and Blaine, Cox and Sherman—were they not all author-Congressmen? And his object, too, not only was blameless, but has good literary warrant. If Scott wrote to build the pile at Abbotsford, why should not Congressman Grosvenor aspire to erect with his pen, not a monument more enduring than brass, but a plain brick house in Athens, Ohio—every brick, of course, being made by Americans for Americans, and laid by union labor?

With examples and aims thus honorable, it is a thousand pities that Gen. Grosvenor has been so misunderstood. It has been said, for example, that an unfortunate air of *de luxe* attaches to this son of the people when he puts out a volume which sells variously at from $25 to $250. But is there not, in this sliding scale itself, a fine considerateness? To the shorn lamb of Wall Street, Gen. Grosvenor handsomely tempers his wind down to $25. As for the rich whom he kindly selects as "patrons" and asks to give a trifle of $250 or $500 for a book whose contents foot up nearly 1,000 cubic inches, it is clearly not their money but their own good that Gen. Grosvenor desires. Books for the million exist in abundance, but where is there a supply of literature for millionaires? The Ohio Congressman has, we are convinced, wholly benevolent designs upon the unlettered wealthy. Let who will make the laws of a nation, is his obvious motto, provided that I may write the volume which will be found on the deck of every private yacht, and which will open the fairy world of literature to the neglected multi-millionaire.

Note, too, the adroit flexibility of Gen. Grosvenor's plan of bringing the comforts of historical composition home to the most despairing magnate. 'The Book of the Presidents' is his title—redolent of patriotism, fairly instinct with the old flag and an appropriation. But the name, like the book itself, is elastic. If you are yourself a President of a railway, or a Trust, or a Republican Club, how insinuating the suggestion that the work is not yet a finality, and that a blank page or two might yet be filled with your biography! It would be a mean-spirited financial nabob who would not pay well for the privilege of thus being jumbled up with Washington or McKinley—all Presidents in the "very miscellaneous assembly" of Gen. Grosvenor's heaven.

Indeed, the literary project of the Ohio Congressman seems to us so meritorious that we are puzzled at a certain timidity and evasiveness of his own in referring to it. At first, he had the usual lofty "nothing to say" to the reporters, who told him that some of his "patrons" considered themselves very much in the light of victims. Then he began to disavow all connection with the sale of the book. He had written it on contract, and there was an end of it, so far as he was concerned. Later, it appeared that he was a financial backer of the publishers—they had a name of which the trade was singularly ignorant. Gen. Grosvenor was "warning every one not to be taken in," telling the public that it "should beware and not buy"—this at the very time that his misinformed agent in this city (the gentleman elegantly known as "the Committee in Charge") was saying that the book was "intended to be a monument to Gen. Grosvenor," and that, of course, "the General's name is the whole thing"! Meanwhile, the *Evening Post* had printed facsimiles im-

plying active, not to say pressing and impudent, interest in the work on the General's part down to a very recent date. To this he sets up the defence of forgery of his signature, and taxes that journal with sinister motives against himself, "a Republican and a protectionist."

On the whole, much as we value Congressman Grosvenor's unselfish intentions, we fear that he has made a mistake. A plain Ohio Representative should hardly have ventured into folio form and "high-art printing." It was sure to lead to misunderstandings. He should have recalled what Voltaire said about its not being the great tome but the little cheap brochure which was the fit tool of the political writer. And as regards brick for his house, he would have been wise to take a hint from Sydney Smith's advice to his vestry, who were debating how to lay a wooden-block pavement—"Just put your heads together, gentlemen, and the thing is done."

MR. CHAMBERLAIN IN SOUTH AFRICA.

Audacity is sometimes, like wisdom, justified of her children; and Mr. Chamberlain's greatly daring plan of going to South Africa in person to confront the problems which the Colonial Office must solve there, has thus far been highly successful. If he is thought of merely as a consummate politician, the cleverness of this move of his cannot but be admired. Even at the Cape, he holds the centre of the stage in England. His speeches are cabled in full and read with breathless interest. His progress from city to city is followed with unflagging attention. While the Prime Minister has to nurse himself at home, and to bear the odium of the unpopular and blundering alliance with Germany, the Colonial Secretary goes on from victory to victory, and his prestige seems to be heightened just in the proportion that that of the Ministry as a whole declines.

It is as a statesman, however, that Mr. Chamberlain's labors in South Africa may fairly entitle him to be judged. If he is acting a part, it must be conceded that he is doing it with extraordinary ability, and deceiving even the very elect of his political opponents. His bearing and his proposals have won public praise for him from such stanch Liberals as Lord Rosebery and Mr. Asquith, and from men who form their judgments on other than party grounds, Liberals though they call themselves—such as Mr. Bryce, John Morley, and Augustine Birrell. Mr. Birrell, in a recent speech, said that Mr. Chamberlain's task was one which required "great courage," and that he had "worthily maintained the reputation he already enjoyed." Further, that the Liberal party would "in no way dishonor the obligations he might enter into in South Africa, always presuming that they had for their main object the peace and prosperity of that quarter of the globe."

Colonial Ministers seldom seek a first-hand knowledge of the colonies they administer. During all the years that Spain owned Cuba, for example, no Minister for *Ultramar* ever set foot in the island. One Colonial Minister did set out to visit Cuba, but the Cabinet fell while he was in transit, so that the first news he had on reaching Havana was that he was no longer in office. There were special reasons, however, in Mr. Chamberlain's case why he should wish to see the field in South Africa with his own eyes. The High Commissioner, Lord Milner, had made himself unpopular both with the loyal colonists and with the conquered but sullen foe. To supersede him would have had a bad effect, it was thought, but to take the reins out of his hands on the spot, as Mr. Chamberlain has quietly done, might lead to good results if a strong man assumed the control. And it was plainly a case where direct dealing with a member of the Government might have the happiest effect upon the discordant populations and conflicting interests which somehow must be welded into a workable whole in South Africa.

That Mr. Chamberlain has had remarkable success in conciliating local opinion and in advancing towards a final settlement, cannot be denied. In meeting the Boers, he has displayed signal tact without any loss of dignity. He has greeted them as brave men who had fought for what they believed the right, and whose hand every Englishman could now clasp with the readiness to let bygones be bygones. At the same time, he has preached the gospel of the British Empire with great fervor, declaring that all separatist tendencies must be for ever ended, whether at the Cape or in the Transvaal or Orange River. The natives he has told that they must work; the English colonists he has indoctrinated in the truth that brains will beat muscle; while the Dutch he has exhorted to contemplate absorption in the Empire as the greatest good that could befall them.

Aside from the triumphs of his personal reception, which have been great, Mr. Chamberlain achieved notable success in arriving at terms of financial settlement. Just how much the Transvaal was to pay, how the money was to be found to make good the ravages of the war, have been burning questions ever since peace was signed. As the exact proposals made by Mr. Chamberlain have been in dispute, we will quote his own words at Johannesburg on January 17:

> "We undertake to submit to Parliament a bill to guarantee a loan of thirty-five millions sterling on the security of the assets of the Transvaal and Orange River Colony, which are being united for this purpose. I should describe it as an investment loan, for it will be devoted to paying the existing debts of the Transvaal, to buying the existing railways, to providing for the construction of new lines in the two new colonies. It will allow for the necessary expenditure upon public works, and will also provide for the land settlement.
>
> "The second part of the agreement is this: As soon as possible after the placing of the first loan, another loan of thirty millions will be issued, to be called up in annual instalments of ten millions. This loan will be treated as a war debt, secured on the assets of the Transvaal. There is no doubt in my mind, or in that of any of those with whom I have conferred, that the assets and revenues of the Transvaal will be ample to provide for the service of this debt; but as proof of their faith in the solvency of the country, that group of financiers who are specially connected with South Africa has undertaken to subscribe the first ten millions, and not to take any commission or any preferential security for the remainder of the loan. By this they have, in my opinion, rendered the success of the loan on the London market beyond all doubt."

Great as is the work already done in binding up the wounds of the war, a vast labor remains, and it will require much time. The enemies which Great Britain still has to overcome in South Africa are greed, indifference to the rights of the blacks, race hatreds, inordinate love of dominion. Those foes will not be wholly put down in Mr. Chamberlain's lifetime, for they represent a problem for the whole world, not merely for South Africa. But his course has thus far been so wisely chosen, his temper so conciliatory, and his plans so sagacious, that his tour in South Africa may be said to have made all the amends now in his power for the rash diplomacy which brought on the untold miseries of a needless war.

PSYCHOLOGY OF THE SALESROOM.

The public sale of a great art collection, like that of the late Henry G. Marquand last week, brings out certain principles, regulating the value of articles, which fall a little outside the scope of political economy. An auction sale of objects of art lacks certain features of the ordinary market, for a market presumes, on the part of buyer and seller, a pretty accurate knowledge of the present value of the thing sold. This is true at an art sale only of a small class of dealers and connoisseurs, and of them in a very limited degree. Prices are regulated by bidders who have no notion whatever of current values, and buy according to their means or their enthusiasm; while the situation is further complicated by the presence of agents who have unlimited orders to buy—directions which must be interpreted by the agent's audacity, and his confidence in the pertinacity of his principal.

These vagaries of the auction room are studied to better advantage in New York than anywhere else in the world. With us great art sales are still a rarity, and the custom of the auction room has not hardened into a code. An auction at Christie's, in London, or the Hôtel Drouot, in Paris, is like a battle according to military law. The non-professional bidder has been entirely eliminat-

ed, and the combatants are impassive dealers who fight according to rule, sternly and without enthusiasm. Nobody knows whether the placid bidder whose every nod means hundreds of guineas or thousands of francs represents an American millionaire with a bottomless purse, a Russian museum, or simply his own sense of speculative values. An American auction, on the contrary, resembles a mêlée in which the regulars are always likely to retire in favor of confident collectors, casual contestants, or merely ignorant persons of wealth. It is these varying passions, disguised in Europe, but fully displayed in America, which make a sale like the recent one of great interest to the student of human nature.

The lover of art looks at the spectacle with somewhat different emotions. He feels, perhaps over-nicely, a certain indignity in making the choicest works of art the prize of the salesroom cock-pit. This feeling grows when he observes that the beauty—that is, the artistic worth—of an object bears only a remote relation to its price. This principle was frequently illustrated at the Marquand sale. For example, the mezzotint engravings after Reynolds brought, on an average, more (one reaching $1,300) than exquisite figurines of Grecian make, and (to take the class of prints by itself) perhaps five times as much as the price for Rembrandt's masterly etchings, or three times as much as Seymour Haden's most important plates. Again, speaking roughly by averages, the conscientious but quite uninspired architectural prints of Haig fairly equalled the Hadens, and left two very beautiful Whistlers well behind.

We shall not be accused of a prejudice against the delightful art of mezzotint engraving (nor, indeed, against the worthy craft of labored architectural etching) if we submit that no copy of a Reynolds, however sympathetic, and no portraiture of a modern cathedral, however faithful, is for a moment comparable to a fine Greek terracotta or a good example of our best modern painter-etchers—not to mention the slightest authentic tracing of Rembrandt's needle. And it should be noted that in this case it is not simple rarity—such as we see in the exaggerated prices paid for "peachblow" porcelain—that makes the less beautiful object command the higher price.

It would perhaps be possible to analyze that complex of the caprice of great collectors and the diplomacy of great dealers which constitutes a fashion in works of art. The moralist and the impecunious will fall back upon the comforting reflection that the fashion is almost always wrong—and always when at its height. There is a kind of law by which the unskilled always buy in the highest market. This is as true of the fashionable collector in the art market as it is of the outsider in the stock market. It is doubtful if a "record" price has often been paid for an object that is the best of its kind. The late Duc d'Aumale for that tiny panel, "The Three Graces," the National Gallery for the "Madonna degli Ansidei," and Mr. Morgan for the "Madonna with St. Anthony of Padua," have successively set the record for paintings by Raphael. Yet none of these pictures is of anything like Raphael's best quality. Similarly the British National Gallery, taking up tardily the Ruskinian fervor for Italian painting of the fifteenth century, paid its highest prices for the more dubious examples now on its walls.

The moral of all this, for such as are not collectors but lovers of art and disinterested observers of the battles of the auction rooms, is: Disregard the relatively more expensive and most abundantly advertised things, and concentrate upon those of middle state. It is there that the abiding things will usually be found. This is, of course, as right a rule for buyers as for onlookers. *In medio tutissimus ibis* seems to be the law of the auction room, as it is of life. It is a satisfaction, also, to remark, as each new auction sale emphasizes the transiency of the fashions of collectors, that artistic value is no more measured by price than is moral worth by the commercial registers.

CONNEMARA, LAND AND PEOPLE.

CONNEMARA, January, 1903.

In a single night, last week, forty thousand mackerel were caught outside the little harbor of Cleggan in Connemara. As the fish-dealers, by their arrangement with the Government, pay for all mackerel, at this season, at the rate of ten shillings per hundred, at least four hundred pounds was earned that night by not more than twenty rowboats. One fisherman admitted having cleared thirty pounds in the week. Yet the rare tourist who should drive through Cleggan would carry away an impression of what he might consider typical misery and squalor. The squalor and dirt are undeniable and are typical enough, for the money of the English and American fish-dealers that pours so freely into the hamlet finds its way into the half-dozen public houses that are conveniently near the little quay built by the Government. Of the ten houses in the little street, six are licensed to sell whiskey. On the morning after pay night last week a fisherman was found drowned within the quay wall under the very windows of the inn where he had been drinking. Nor are the opportunities of buying bad whiskey at a ruinous price likely to decrease while the local shopkeepers are in the majority as rural magistrates. For that is what local government means in Ireland—the predominance of the small shopkeeper, and the consequent withdrawal of the educated classes from local and national politics. In this part of Connaught the shopkeepers have gradually acquired from the country people the tenant-right of a great part of the land, and are beginning to form a middle class from which their descendants will emerge as gentry.

The present distribution of the land in Connemara is a good illustration of the inability of the Irish to keep their footing on their own ground. Half a century ago, the Martins were called the "Kings of Connemara," and boasted that their avenue was forty miles long, since the road for that distance passed through their land and led only to their castle of Ballynahinch. Not many years ago there was still legible over the west gate of Galway the inscription which the Martins and Joyces wrote there in the sixteenth century:

> "From the ferocious O'Flahertys
> Good Lord deliver us."

In those days Connemara, with its outlying islands, was still held by a few Irish chieftains who recognized no law and were well able to maintain their independence of English rule. They looked to Spain and the promised Armada to free them from the annoyance of the encroaching English, who had seized the fortified town of Galway. By land, the mountain passes and dangerous bogs made Connemara inaccessible to the invader. By sea, the pirate galleys of the famous O'Malleys were easily able to outwit the British cutters, which could not follow them through the intricate maze of islands lying off this dangerous coast. Spanish influence was paramount mainly through the prosperous trade of Galway with Spain, and it was not until the failure of the Armada that Connemara began to make terms with the English. "To hell or Connaught" was an oath still in vogue with the soldiers of Cromwell.

The "ferocious O'Flahertys" derived their epithet from their method of getting rid of rival chieftains by the simple Homeric device of inviting them with their retainers to dinner, and slaying them "as one kills an ox at the stall." They and the O'Malleys, with whom they intermarried, long since sold their lands to English owners and disappeared. The ruins of their sea stronghold in Bunown harbor are still a landmark. Though the Martins survive and have maintained their rank, their Castle of Ballynahinch (with the greater part of their vast estates) has passed by the inevitable steps into English hands. The castle of the D'Arcys, who founded Clifden, the capital of Connemara, stands empty, and is falling into the rapid decay that waits on neglect in this damp climate, where a house that stands empty for a year must be practically rebuilt to be habitable. The Joyces, who gave their name to a large tract still marked on the map as "Joyce's Country," are represented by some of the poorest cabin people. Throughout Connemara the same conditions hold. The landowners are English. Hence it is that there are no Catholic gentry, and that all the Catholics walk to one church on Sunday, and all the Protestants drive to another—one of the most significant sights of Irish country life.

This country is the paradise of the sportsman who prefers rough mixed shooting with a great variety of game to organized "drives." The sea and lake fishing is excellent, while the salmon rivers are the best in Ireland. Ireland is, as a whole, more given over to the delights of sport than any country in the world. A keen interest in hunting, racing, coursing, and all the minor forms of sport pervades

every class of society. But to maintain a sporting estate in the west of Ireland one must not be dependent on a revenue from the soil. Fifty years ago, when the district was thickly populated and the rents were unfair to the tenant, the Irish landowner could live from the land; in these days of Land Bills, when the tenants are greatly reduced in number by emigration, and the rents are unfair to the landlord, he must have a fortune independent of his estates. The varied industries that are open to a thrifty worker in these parts are seldom properly estimated by the experts who are sent by the Government to adjust the rents. Every fifteen years, under the recent bill, a tenant may carry the question of his rent into the land courts; the expert comes down, and, being usually unaccustomed to local conditions, underestimates the possibilities of the holding, and the landlord loses still more of his much-reduced rental. The Irish of the peasant class love litigation and will seldom neglect the opportunity; the landlord has everything to lose. With the present conditions of dual ownership, by which the landlord cannot get rid of a tenant however undesirable so long as he pays his rent; with the ever-imminent prospect of some experimental Land Bill which will oblige him to sell on ruinous terms the best portions of his demesne, it is not surprising that a landowner in this part of Ireland regards the possession of land as a hazardous luxury. If a bill should be passed giving the tenants the option of buying the freehold at a few years' purchase, few landowners in this part of Ireland will remain on their estates, which will be ruined for the sporting purposes for which nature seems to have designed them. It is not surprising that, with this in view, those who can afford it have in some cases already bought out the tenant-right from their tenants, preferring a present certain loss to complications in the future. Compulsory purchase in Connemara would be a short-sighted policy for the tenants, because the landowners, who now provide them with regular work by which they eke out their holdings, would promptly desert a district which would provide them with neither income nor sport.

Meanwhile, the promised Land Bill is awaited here without much anxiety. With all his greed of land, the Connemara peasant knows too well that the presence of a landowner who spends money freely on building and improvements means more to him than a few more acres of poor grazing land. That is the reason of the failure of the Land League to gain converts in this district. The solitary "Land-Leaguer" in Cleggan is an object of some distrust and derision among the country people, while the priests, for once, are here, at any rate, on the side of order and the ultimate good of their people. W. C. F.

REBELL'S BALZAC, STENDHAL, AND MÉRIMÉE.—I.

PARIS, January 13, 1903.

It was a singular idea on the part of M. Hugues Rebell to find a bond of unity between the writers named in the catching title of his 'The Inspirers of Balzac, Stendhal, and Mérimée.' It must be declared at once that these inspirers are women; better than men they draw the attention of a frivolous public. The bond I have spoken of is thus defined in the short preface: "Pure chance did not unite these three figures. Though they understood and spent life in such different manners, they have this in common, that they sought nowhere but in themselves for their standard of morality, that they did not live for a crowd or for a group, but for the free development of their imagination, of their sensibility, of their intelligence." And the author adds at the end: "As love is the most vivid and complete passion, which employs all the energies of our being, it reveals better than any other the master faculty, the primordial soul which guides us from youth to death. The pages which it suggests to our writers will help us, better than any document, to imagine their souls."

M. Rebell studies Balzac not only in his novels, but also in the two volumes of his Correspondence. During all his life, Balzac had female correspondents. He confides to an unknown lady, who signs merely Louise, his troubles, his hopes, as if she were an old friend. Madame de Berny had a great place in his life; she had a real devotion for him. When Balzac was in serious money troubles she helped him with her own money, and induced his family and friends to pay the debts of the printing-office which Balzac had imprudently bought. "For twelve years," writes Balzac, "an angel robbed the world, her family, her duties . . . of two hours, which she spent with me, nobody knowing anything about it—two hours, do you hear? Without her I should have died." Balzac was the confidant of Madame de Berny's troubles—the ill conduct of a son, the madness of a daughter, the brutality of a husband. He painted her under the name of Madame de Mortsauf. "Madame de Berny," writes Balzac afterwards to Madame Hanska (who became his wife), "was not young; and, believe me, youth and beauty are something. My dream at that time was incomplete." It was in order to please Madame de Berny that in some of his novels he pleaded the cause of faded beauties, of the "femme de trente ans." Madame de Berny was the daughter of Hinner, who played the harp for Marie Antoinette. After the death of her husband, Madame Hinner married the Chevalier de Jarjayes, one of the men who plotted to save the Queen. Madame de Berny was naturally thrown into royalist society; she knew the Duras, the Castries, the Fitz-James; she rendered Balzac familiar with the feelings, the traditions, of the aristocratic part of France, and she thus furnished him many useful documents for his novels, and probably helped to form his politics, if Balzac can be said to belong to a political party.

We will not speak of several ladies whose names are given by M. Rebell, as they seem to have had very little influence on Balzac's mind. It was not so with the Duchess de Castries, whom he painted under the name of Duchess de Langeais. "She was," says M. Rebell, "perhaps, of all his friends, the one who inspired him with the truest and most human passion." She was a tall woman, with magnificent blond hair, with a Roman and somewhat hard profile; ironical, proud, with much coquetry and some impertinence, having, by contrast, in her eyes, like most invalids, something tender and beseeching." She had had a bad fall on the hunting-field, and had to spend most of her time on a sofa. After having read the 'Peau de Chagrin,' she wished to know the author, and Balzac soon became one of the visitors at the Hôtel de Castries, in the Rue de Varennes. This acquaintance was an event in his life. He continued to work as hard as ever, but he became more worldly, bought two carriages, took two male domestics. He followed his friend to the waters of Aix. Their friendship, to use the words of Madame de Sévigné, was interrupted by storms (*la grande amitié vit de querelles*). Balzac wrote to Madame Zulma Carraud, his constant and devoted friend:

"I have come here for much and for little: for much, as I see a gracious, amiable person; for little, as I shall never be loved by her. . . . She is the finest type of woman, a better Madame de Beuaséant [one of Balzac's heroines]; but are not all these pretty ways assumed at the expense of the soul? I say to myself that a life like mine ought not to be tied to a woman's petticoat, that I must follow my destiny."

The acquaintance ended in a sort of worldly and somewhat dissatisfied and disappointed friendship. Two years after a small incident which had caused some coldness between them, he wrote to her, in answer to a letter of compliments which she had written him:

"You have added a little bitterness to what you have the goodness to say to me regarding my book. I should have preferred to have you look upon my book and my pen as things belonging to you, rather than to receive such eulogies. But I cannot tell you all my soul—it would perhaps astonish you; it would need some veils and some leisure, and I must, poor workman as I am, return to my work. I hear the bell in my cloister, and I must finish for the Review the picture of a sentiment so great in itself that it can resist perpetual wear; it is a spring at which ingratitude can drink without ever drying it."

The relation of Madame Hanska with Balzac began, as was usual with him, with a letter. It came from Odessa, and was followed by many others, all written in relation to his works. It was a somewhat factitious correspondence; but Balzac was a man of imagination. The unknown lady gave him a rendezvous at Neuchâtel; he saw her there, and persuaded himself that he had found a successor to Madame de Castries, a new inspirer. She belonged to the Polish nobility, had been married to Count Wenceslas of Hanski, and had a young child named Anna. The Count was very wealthy, but was twenty years older than herself, and of a disagreeable character. She spent the greater part of the year in a château in the Ukraine. Balzac was more fortunate with Madame Hanska than he had been with Madame de Castries. When she returned to Poland, he wrote to her incessantly. He idealized her, called her his star, his adored mistress; but he often had nothing to say to her—the correspondence was almost a fatigue. He wrote eighteen hours every day, and was proud to say so. He described to Madame Hanska the incidents of his toil, of his struggles. One day, when he had found 6,000 francs at his bookseller's, he says: "I am free for the day; my payments are being made; I am tranquil for a month. *Ecco, signora*, my very faithful spouse, don't I owe you this faithful picture of your ménage in Paris?"

Count Hanski at times became uneasy, and Balzac had to contrive special letters in which he explained that his letters to

his wife were mere literary compositions, which she asked for. When the Count died, his wife became free. She had promised Balzac to marry him. Thirteen years had elapsed; the passion of the first days in Switzerland had had time to cool down. Balzac was struggling constantly with his creditors; he had to flee from house to house in Paris, sometimes to conceal himself absolutely under a false name. His dramas had no success. Madame Hanska did not seem in a great hurry, and found many pretexts for adjourning her marriage. The Emperor of Russia would not give his consent, which was necessary; she could not separate herself from her children. She put off her engagements when she had promised to meet him. Balzac was determined, however, to marry Madame Hanska. He interrupted his work (he was writing the 'Paysans,' a masterpiece which, through the fault of Madame Hanska, remained unfinished), and left twice for Poland. He was suffering from heart disease; Madame Hanska received him politely, took care of him, finally took pity on him. The marriage was celebrated on the 14th of March, 1850, in the Church of Sainte-Barbe of Berditcheff.

He returned to Paris with his wife at the end of May, and established himself in a little pavilion in the Rue Fortuny, which he had bought after some happy speculation, but which was not wholly paid for, though he had filled it with pictures and other works of art and curiosities. His malady was making rapid progress; he had constant suffocations. He could no longer write or even open a book. Madame Hanska was not at his dying bedside, and had not been with him in the latter part of his life. M. Rebell is very hard upon her.

"What had passed?" he asks. "We don't know; but let us admit that Balzac had been unjust and unkind to his wife—was not his malady, were not his sufferings, sufficient excuses . . . ? The attention which the lowest of creatures, which perhaps Madame de Castries, would have been happy to render, because she had a woman's heart—this cold and heartless creature . . . refused to bestow on him. . . . The page in which Victor Hugo denounces her is immortal; immortal also are the letters to the 'Étrangère.' "

She was, indeed, an "étrangère" to Balzac, and his marriage with her was an error on both sides. A literary correspondence, carried on for years, is not a proper introduction to conjugal life. This is perhaps the moral to be drawn from the very imperfect and, in many senses, shallow work of M. Rebell. Men of genius are but poor lovers; they are constantly carried out of the ordinary paths of life; they are the slaves of their own work. Few are so fortunate as to find a companion in life ready to sink her own personality in her husband's, to identify herself with him like a shadow. Balzac's case is particularly painful, as he had bound himself to an almost superhuman task, and as his nature was so complex, so mixed with noble and with coarse elements, as to be a problem even to himself.

Correspondence.

CONTENTIOUS PUBLIC "DOCUMENTS."

TO THE EDITOR OF THE NATION:

SIR: It may safely be assumed that, in ordering the printing of certain public documents, Congress has not intended to stir up religious and historical strife, but in two recent instances such results are likely to follow. The usual reason for ordering the printing of miscellaneous publications as "documents" at public expense is to provide something attractive for members to distribute to their friends and followers, or to meet the demand of some constituent or constituents of a member.

What is known as "Thomas Jefferson's Testament" belongs in the first class, and Senate executive document No. 37 of the third session of the Forty-first Congress belongs in the second class. Of the first-named work, Congress at last winter's session ordered 9,000 copies to be printed, and of the second the Senate, on the 15th of January instant, ordered a reprint of "2,500 additional copies" "for the use of the Senate."

Of the first it is only necessary to say that it is an edition of the New Testament expurgated by a Freethinker, and with a preface to be written by a Jew. Though the Freethinker was one of the Fathers of the Republic, and though the Jew is both scholar and gentleman, it is not to be believed that either of them would have been chosen by Christians to edit or preface a book which the churches hold to be sacred, and which is the foundation of belief in the divinity of Jesus Christ. Few have read the expurgation, but the general understanding is that it edits all the divinity out of the New Testament. Protests against its official publication by the Government have already been made by some religious bodies, and in consequence the member who introduced the resolution which led to its publication tried to have it rescinded, but he did not succeed. If numerous protests do not follow the actual publication of the "document," if document it can be called, it will be strange indeed.

Senate Document 37, first printed in 1871, is now to be reprinted, in all probability because of a controversy over the Marcus Whitman legend which has been running along in the pages of the *Sunday-School Times*, of Philadelphia, for some months past. Notwithstanding the utter obliteration of the legend by Prof. E. G. Bourne, in his 'Essays in Historical Criticism,' the controversy in the *Sunday-School Times* has revealed the fact that there are in Oregon descendants of the early missionaries who adhere to it, and it is very likely that they made the request for the reprint, as the resolution for it, which the Senate considered by unanimous consent and passed without a dissenting voice, was introduced by an Oregon Senator. The probability of the reprint having been ordered at the request of the Oregon adherents of the legend is made greater by the fact that there is a collateral legend to the effect that when Document 37 was published, Catholics secured all the copies and destroyed them.

Document 37 is the H. H. Spalding collection of stories in which the legend that Dr. Whitman made his famous ride across the continent in the winter of 1842-3 to "save Oregon" from British annexation (instead of to save his mission station from closure by the American Board) first appeared in tangible and permanent form. It had previously been published by the Rev. Mr. Spalding in the *Pacific* newspaper of San Francisco, but not even there till many years after the ride and many years after Dr. Whitman's murder by the Indians. In Document 37 Mr. Spalding also reiterates the charge previously made in newspaper publications that the Catholic missionaries in Oregon instigated the murder of Dr. Whitman and his family by the Cayuse Indians in 1847. To this exceedingly offensive and injurious charge the Rev. J. B. A. Brouillet, Vicar-General of Walla-Walla, replied in 1853, in a series of papers first printed in the *Freeman's Journal* of New York, and later in the same year in a pamphlet entitled 'Protestantism in Oregon,' published in New York. This pamphlet was also published as a public document of the United States by both the Senate and the House. It is appended to a report of J. Ross Browne, Indian agent in Oregon, beginning at page 13 and extending to page 66. The document is numbered 38 in the House series, and 40 in the Senate series, both of the Thirty-fifth Congress, first session. The date of the order for printing is March 31, 1858. A second edition of Father Brouillet's pamphlet was published in Portland, Oregon, 1869, under the title, 'Authentic Account of the Murder of Dr. Whitman and Other Missionaries by the Cayuse Indians of Oregon, in 1847, and the Causes which led to that Deplorable Catastrophe.' It is altogether probable that the Catholics will wish to have another edition of Brouillet's book, or of something else, printed as a "document" at public charge to offset the reprint of the Spalding stories. The Spalding document also attributes the instigation to the Hudson Bay Co.

Why should the Government print again a document of which it has already published refutations? The Government did not publish Professor Bourne's criticism; this was, however, read at the 1900 meeting of the American Historical Association, which is to a certain extent a Government institution, as all its proceedings and papers are published as public documents. Professor Bourne chose instead to have his paper printed in the *American Historical Review* (January, 1901), and afterward expanded it into the form in which it appears in his 'Essays in Historical Criticism.' But at the same 1900 meeting of the American Historical Association, Mr. William I. Marshall of Chicago read an equally damaging criticism of the Whitman legend, and this was printed in the Report of the Association as a public document. It is to be found in Volume I. of House document 548, Fifty-sixth Congress, second session. An earlier refutation was published by Mr. H. M. Beadle of Washington in the October, 1899, number of the *American Catholic Historical Research* of Philadelphia.

Dr. Whitman was murdered in 1847, Missionary Spalding died in 1874, Missionary Brouillet died in 1884. Why should they not be permitted to sleep in peace, at least so far as the Government is concerned? Ross Browne, in his report to which the Brouillet pamphlet is appended, says that the early missionaries in Oregon spent more time and effort in quarrelling with each other than they did in caring for the well-being of the Indians. Is it not rather late for the Government to take part in those old quarrels and reopen wounds which only time and silence can heal?

F. A. CRANDALL.

WASHINGTON, January 28, 1903.

THEORY AND INVESTIGATION.

To the Editor of The Nation:

Sir: Mr. Richman's study of 'Rhode Island,' of which a very discriminating review recently appeared in the columns of the *Nation*, is an unusually interesting instance of the relation between "theory" and "investigation." It is not always easy to judge, from internal evidence, in the case of any given book, whether (to use your reviewer's language) "the theory" is "the result of the investigation," or "the investigation the result of the theory"; and in those instances where the latter condition is true, it will usually be found that the subject is one which has long exercised a predominating influence over the writer's mind, for any one of several reasons. Either he has long resided in the locality to be studied (such as, in this instance, Rhode Island might be); or the insidious influence of "ancestor worship" has in some way linked him to this locality; or the course of study to which he has been directed by his college instructor has overwhelmingly fixed his attention on that field.

In Mr. Richman's case, not a single one of these conditions was operative, and it is difficult to conceive how there could be a more pronounced example of the opposite extreme. The author in this case is a man well towards middle life, who was born in Iowa, nearly a thousand miles away from Rhode Island, and had never been in this State until he came here in 1900 to begin his investigations. Among his ancestors there is not a single Rhode Island family, and not even a single New England family. Of the State and its history he knew as little as it is possible for one to know of any one of the forty-eight United States; and his interest was fully on a level with his knowledge until a chance remark by Mr. Bryce, made in conversation about six years ago, led him to turn his thoughts in that direction. In brief, his mind, so far as the theory subsequently developed is concerned, was, up to the time of undertaking the investigation, a true "tabula rasa."

Students of historical method will remember a noteworthy address on Ranke by his pupil, Dr. von Sybel, published in the *Historische Zeitschrift* in July, 1886, which indicates with marked lucidity the necessity for avoiding the "subjective" point of view, which persistently tends to mingle itself with one's conceptions, in dealing with historical questions. Whether Mr. Richman has ever met with this paper of Dr. von Sybel, I cannot say; but a recent statement which this American writer has made as to the sequence of "theory" and "investigation" in the processes of his work, shows that he is thoroughly in accord with the German writer's principles. It reads as follows:

> "The narrative part was finished before I began to group the philosophy implicit therein. I finished the narrative, and then, on revising it, began to understand its philosophical significance. This so struck me that I went back over my work, and, without bending it at all, merely pointed out its teaching. This, it seems to me, is exactly what the historical investigator should do—study his facts, and *then*, if he finds meaning therein, announce it."

So far as the work of investigation itself is concerned, Mr. Richman's procedure was thorough to the last degree. At great expense to himself he came to Rhode Island, and made his residence in the State for many months at a time, in two successive years. For reasons which are obvious, he came in contact, while here, rather with custodians of the sources of information (in libraries and manuscript collections, and similar places) than with those who were intimately associated with one or another view of Rhode Island history. Those who talked with him usually recognized the extremely interesting nature of his problem, and, while withholding nothing from him (not even personal opinions, on occasion), of course made no effort to impress any one view of the subject upon him.

What has been said above, in regard to "theory," has reference almost wholly to the "theory of political individualism" which characterizes the completed book. There are various subordinate historical studies involved in the book, all of which are of great interest, including the tracing of an analogy with one of the Swiss cantons, in chapter x. So fully had Mr. Richman's earlier studies, as embodied in his very original volume on 'Appenzell,' turned his attention in this direction, that he would doubtless himself hasten to admit that here his mind could hardly have been the "tabula rasa" which it was in relation to the "main theory."

This contrast, however, only serves to bring into stronger relief the noteworthy character of the book as concerns the development of the main theory, above indicated.

William E. Foster.

Providence Public Library, January 27, 1903.

WHITTIER NEWSPAPERS.

To the Editor of The Nation:

Sir: In reply to the inquiry of Prof. G. R. Carpenter, I state that the only file of the *Middlesex Standard* known to have been preserved for the six months during which it was edited by John G. Whittier, who then (1844-1845) lived in Lowell, is now in the possession of the Lowell Historical Society, having been bequeathed to it by the late Zina E. Stone. The papers afterwards published by Mr. Whittier in the book entitled 'The Stranger in Lowell' first appeared in the *Middlesex Standard*, which was published weekly. The file is in one volume, and is in the Society's library in Memorial Hall, Lowell.

Charles Cowley.

Lowell, January 26, 1903.

Notes.

Mr. J. M. Dent is making as complete a collection of the letters of Charles Lamb as possible for publication, and will be grateful to collectors in America who will allow him to have transcripts of their possessions made and forwarded. Communications may be addressed to Messrs. J. M. Dent & Co., 29 and 30 Bedford Street, Covent Garden, London.

Henry Stevens, Son & Stiles, London, have in preparation facsimiles of the recently discovered Waldseemüller map of 1507 and the Carta Marina of 1516, with a geographical and historical introduction by Professors von Wieser and Fischer. The number of copies will be limited. Each map is on twelve large sheets, which, if put together, would approximate the dimension of 8 by 4½ feet.

T. Y. Crowell & Co. will shortly bring out "A Midsummer Night's Dream" as first in a series of literal reprints of the plays in the First Folio Shakspere of 1623, to be edited by Charlotte Porter and Helen A. Clarke, and produced in modern type at the De Vinne Press. The same firm announces 'Down the Orinoco in a Canoe,' by Señor Perez Triana.

Proximate publication of the following works is announced by G. P. Putnam's Sons: Émile Boutmy's 'The English People,' translated by Elsie English; 'Buddhist India,' by T. W. Rhys-Davids; and 'Mediæval India under Mohammedan Rule, 712-1764,' by Prof. Stanley Lane-Poole.

Brentano's will soon have ready a work in Danish, 'Of America,' by Carl Fischer-Hansen.

'The Western Slope,' a small volume of essays by Mrs. Celia Parker Woolley, is in the press of William S. Lord, Evanston.

Mr. Charles Welsh, recently with D. C. Heath & Co., Boston, is at work on a 'Key of the Treasure House' (*alias* "The Young Folks' Library" of his compilation).

There must be a law of concurrent publication which gives us this season, for example, FitzGerald, Carlyle, and Webster revivals, and brings to our table at once two handy editions of Jane Austen in five volumes. That of Macmillan Co. is chiefly distinguished, apart from Mr. Austin Dobson's introduction, by the illustrations of Hugh Thomson, and reproduces at lower cost the first output some half-a-dozen years ago. The Messrs. Putnam's edition has a nearly identical typography, measure for measure, yet makes up into somewhat thicker volumes, more elaborately decorated externally (and in very good taste), while the inner covers have been ingeniously employed by Miss Blanche MacManus for bird's-eye-view maps of the actual face of England as involved in Miss Austen's tales, and of the supposed neighborhood in each case. This is an excellent idea, particularly for the sake of readers whose sense of orientation is defective, and who need something more than the author's own grasp of her topography.

Twenty-one years have elapsed since we passed judgment on Mr. J. Henry Shorthouse's historical novel, 'John Inglesant,' which, with all its shortcomings, we found a remarkable first book, worthy of a permanent place in romantic fiction, especially for its Italian portion. "Philosophical romance" is the term which the author prefers for these "Memoirs of the Life of Mr. John Inglesant, sometime servant to King Charles I.," etc. He has now renewed its appeal to the cultivated public in a limited three-volume edition of most generous make, bound in green silk, and printed in large type (Macmillan Co.). Mr. Shorthouse's portrait, after a portrait by Sandys, is prefixed to volume one. No doubt in its new form the story will find a hospitable welcome even from possessors of the old.

From the same publishers, in conjunction with George Bell & Sons, comes a three-volume reissue of Carlyle's 'French Revolution,' edited with a brief introduction and notes corrective and explanatory in moderation by the historian, John Holland Rose. Mr. Rose has something useful and novel to reveal as to the genesis

of the work in Carlyle's early French studies, and his criticism is independent if not exhaustive; but he is in the main an admirer. He thinks that Mill's accidental destruction of the first part of the MS., necessitating rewriting, worked a gain to the narrative, if severely straining Carlyle's physical powers. The large type of this reprint needed more liberal "leading," and the page is formidably compact. A marked feature is the reduced copies of contemporary prints, mostly taken from the 'Tableaux Historiques de la Révolution Française,' with numerous portraits. We shall presently have occasion to discuss the permanent value of the 'French Revolution' in connection with Mr. Fletcher's edition.

The posthumous publication of the late Henry Sidgwick's lectures is continued in a volume on 'The Ethics of T. H. Green, Herbert Spencer, and J. Martineau' (Macmillan), which constitutes the critical outworks of the system embodied in his well-known 'Methods of Ethics,' and exhibits his talent for lucid statement and scrupulous candor to conspicuous advantage. The criticism of Green is rightly put in the forefront: it is the most searching, most valuable, and, it must be added, most damaging. Sidgwick begins by exposing the lack of connection between Green's metaphysics of the eternal self-consciousness and his ethics, and continues by censuring the confusion of his psychology, the inaccuracy of his history, the vagueness and practical uselessness of his moral ideal, and the unfairness and ignorance of his polemics. Altogether, though it is marked by occasional touches of an acerbity to which it must have been hard to provoke Sidgwick's mild wisdom, this criticism must be pronounced to leave little, if any, foundation for the reputation of the confused and singularly overrated thinker whom it dissects. In dealing with Spencer, Sidgwick is chiefly concerned to point out the incomplete fusion in his thought between utilitarian and evolutionist tendencies, and to show that in point of fact more ethical guidance is derived from the former; but he is also very successful in tracing many of Spencer's distinctive doctrines, *e. g.*, his individualism and anti-militarism, to their foundations in his personal sympathies. As against Martineau, Sidgwick contents himself with showing that his intuitionism cannot either claim the support of common sense or solve the actual problems of morals. The volume has been edited by Miss Constance Jones, and has prefixed to it an excellent analysis of the whole argument.

An important legal publication, just completed in three volumes, is Prof. J. H. Beale, jr.'s 'Selection of Cases on the Conflict of Laws' (Cambridge: The Harvard Law Review Publishing Association). This collection is the result of a seven years' experience in teaching the conflict of laws, and, if we are not mistaken, is the only one of its kind. Mr. Beale's volumes divide the topic into four parts: First, we have the jurisdiction of states—the extent of their legislative and judicial power, and of the obligation and right of individuals to obey and take advantage of the legislation of one or another state. "These are questions of *international law*, which should properly be decided in every country in the same way." Second, the creation of legal rights and obligations, as a result of the sovereign action of states; here the questions involved are "rather questions of foreign fact than of law." Next comes the recognition and enforcement within one state of rights and obligations which have been created in another state—a question, according to Mr. Beale, "not in any sense international," but "to be determined in accordance with the municipal law of the state concerned." Finally, "there remains to determine the legal process by which, if at all, the foreign right shall be enforced; also obviously a municipal question." It may be inferred that Mr. Beale repudiates the term "private international law" as inadequate and misleading. The volumes contain many notes, and are an important addition to the literature of the subject.

'Racquets, Tennis, and Squash,' by E. H. Miles (D. Appleton & Co.), is an excellent exposition of these games. Mr. Miles is a champion at all three sports, and has written entertainingly of the details of each. There is in the book much instruction for novices and experts, and it is the most comprehensive work on the subject ever written.

The *Library Journal* for January foots up Mr. Carnegie's library benefactions in America during the past year at $4,214,000; in Great Britain at not less than $1,500,000. If we thought that these six millions bestowed on Pennsylvania alone would have ensured that State's being lifted out of the slough of Quayism, we could almost regret with Governor Pennypacker that home-made wealth did not stay at home. But communities cannot be made moral by public libraries alone.

Among the historical manuscripts published in the January Bulletin of the Boston Public Library is one from David Howell to the Hon. John Brown, dated Providence, January 26, 1801, giving his reasons at length for not supporting Aaron Burr for the Presidency. He is not known to the people of Rhode Island, and his "Character as given by his Friends is that of Ambition Enterprize and Activity." Mr. Jefferson will not show partiality in the distribution of "publick Appointments"; but "If Mr Burr succeeds, will the Northern share of Loves and Fishes reach farther than in and about New York?" Mr. Brown warns his correspondent that the election of Burr may cause a "proper Fire of Discontent, if that Fire should blaze out and rage, if convulsions take place, who can tell where the Evil may terminate?" Captain Henry Bates, of an American schooner which has been "capturd by a Bermidian Privateer Sloop mounting 3 Carage Guns" and carried into the "Burmudas," writes from thence August 20, 1795, to his owners. The cause of the seizure was that "they consider the Windward French Islands to be in a State of Blockade. Which is not the case, as the British Forces is withdrawn from them Islands 2 weeks before I arrived there." He intends to "claim the Property & stand tryal in order to have the Priviledge of apealing to the Court of Britain hereafter, if you should think proper," and closes an indignant epistle with "I should not have Room to tell you how many Insults we americans are obliged to submitt to at this place."

In an interesting review of the commercial and industrial condition of Germany, in the Consular Reports for January, Consul-General Mason says that the recovery from the financial depression of the past few years seems definitely to have begun. This is due almost wholly to the active foreign trade, in which the United States leads in the imports and is third in the exports; the adverse balance in favor of this country being $156,189,800. The underlying cause of the depression was the enormous transfer of productive labor from agriculture to industries within the past twenty years, which changed the whole economic balance of the Empire and resulted in a vast overproduction of many kinds of merchandise and an underproduction of food materials. Other subjects treated are the automobile trade in foreign countries and the regulations in vogue for the use of this vehicle, the new Japanese tariff, which takes effect April 1, and the foreign investments of France. These amount to six thousand million dollars, of which nearly a quarter has been loaned to Russia for the building of the Trans-Siberian and other railroads. The investments in this country are $115,800,000. The consul at Toronto gives some account of recent peat-fuel operations in Canada, in which are some timely words of caution, drawn from Canadian experiences, to persons proposing to utilize peat-beds.

While gold mining and missionary effort occupy the minds of most Americans in Korea, so that the tiny empire is far from being a theme overwritten, the *Korea Review* appears promptly, the number for November, 1902, treating luminously of taxation and astrology. Professor Hulbert's 'History of the Korean Nation' has reached the Japanese invasion of 1592, and shows how jealousy among Hidéyoshi's generals wrecked his ambitious scheme of reaching China. Very remarkable is the fully accredited episode of the Korean iron-clad, built for speed, able to overtake anything else, and which destroyed the second Japanese fleet. To this day the people of Ko-sung village annually celebrate with a regatta the exploits of the Korean Admiral Yi and his "Tortoise Boat." Lieut. Foulke, U. S. N., in 1884 wrote that the ribs of the giant craft were still visible in the sand. In connection with the elaborate historical studies of this same period in Japan, in the *Japan Mail*, under the title of "The Christian Daimyo," the student and general reader is now well furnished.

An application for leave to open a public library in Constantinople was recently made to the Minister of Public Instruction. He refused permission on the ground that the books, of which a list of some ten thousand had been furnished him, were immoral and "dangerous for the Sultan." La Fontaine's "Fables" especially were objected to from their frequent references to the lion as the king of beasts, which, it was urged, "would be regarded as degrading to the kingdom and insulting to the Sultan."

In the Anglo-Abyssinian treaty recently concluded at Adis Ababa, the Emperor Menelek makes an important concession in return for an increase of territory in the southwest. This is an engagement "not to construct, or allow to be constructed, any work across the Blue Nile, Lake Tsana, or the Sobat which would arrest the flow of their waters into the Nile." The significance to Egypt of this agreement lies in the fact that not only does the largest part of the supply of the main stream come from

these sources, but the Blue Nile, which rises in Lake Tsana, sends down incomparably more fertilizing waters to Egypt than the White Nile. It makes possible the carrying out of the irrigation scheme, proposed by Sir William Garstin and endorsed by Lord Cromer, for converting the lake into a great reservoir, thus adding materially to the cultivable land in the Nile valley. The industrial and commercial development of this region is also promoted by the lease of territory on the Baro River to the Government of the Sudan for a commercial station, and the permission "to construct a railway through Abyssinian territory to connect the Sudan with Uganda."

—*Scribner's* opens its promised series on the Government of the United States with a paper, by James Ford Rhodes, on the Presidential office, already noticed in our editorial columns. It may be added that Mr. Rhodes seems not to have revised the view of Van Buren expressed in his 'History,' though one can hardly see how the old attitude of contempt is possible since the publication of Mr. Shepard's biography of Van Buren in the American Statesmen Series. Edith Wharton comes to the defence of Milan against the indifference, or contempt, of the stock tourist. She finds the city "rich in all that makes the indigenous beauty of Italy, as opposed to the pseudo-Gothicisms, the trans-Alpine points and pinnacles, which Ruskin taught a submissive generation of art critics to regard as the typical expression of the Italian spirit." She will have none of the purely Germanic idea of the picturesque, "connoting Gothic steeples, pepper-pot turrets, and the huddled steepness of the northern burgh," as against the Latin ideal of space, order, and nobility of composition. Connolly's description of the "Running to Harbor" of the Gloucester mackerel fleet in a gale has much more of pleasurable excitement in it than his recent account of modern whale chasing, which ends with the firing of an explosive bomb into the whale's vitals from a machine gun. In "The Field of Art," Henry Rutgers Marshall pleads earnestly for more attention to æsthetics in our colleges and universities.

—We have spoken of the Poe-Chivers papers, in the *Century*, as of no great importance. The second instalment, in the February number, brings out rather more of Poe than the former, but Dr. Chivers himself does not improve on further acquaintance. It would be strange to find any other admirer of Poe using such language as, "Poe stole everything that is worth anything from me," and, "Do you conscientiously believe 'The Raven' is to be named in the same century with 'The Vigil'?" But Dr. Chivers is *capable de tout*, even saying of one of his own volumes, which William Gilmore Simms had criticised, "There is not a poem in that book that is not *per se* a work of Art—a work of Art not only as an Art-work, but *fortuitously* so—the Existere of it being coeternal with its Esse. This the glorious Poe saw in my first book, but he was too full of envy to express it *fully*," etc., *ad nauseam*. To such a man the world was, of course, full of "biped Asses," "miserable wretches," "two-legged serpents" waylaying his path to poison him with "the harmless venom of their polluted lips." Why, there were even "Asses in this very county who are fools enough to persuade their pitiful souls that a man born in Wilkes cannot write poetry." But "Magnus [*sic*] est veritas et prevalebit." Henry Loomis Nelson writes of "The Overshadowing Senate," closing fitly with the words of Lord Bute, "The forms of a free and the ends of an arbitrary government are things not altogether incompatible." Frank Wilbert Stokes contributes a paper on the Aurora Borealis, as a setting for the reproduction of four of his own paintings, from displays witnessed during various arctic cruises about ten years ago. All things considered, the pictures doubless deserve commendation, but no painter's brush will ever reproduce the aurora. The editor, writing of "Nature and Human Habitation," pays a deserved tribute to the late Charles Eliot, landscape architect, the son of President Eliot of Harvard.

—Mr. William Morton Payne's third volume of essays, entitled 'Various Views' (Chicago: A. C. McClurg & Co.), is, like its predecessors, made up of thirty leading articles written for the Chicago *Dial*, of which he is editor. Mr. Payne's essays are the fruit of a wide and intimate acquaintance with modern literature. They are neat and suggestive, if not brilliant, and are always well worth reading. They are usually inspired by some passing tendency in literature, or by another's critical utterances, which Mr. Payne takes as a text either to amplify or to refute. They would be excellent as short sermons from a literary pulpit, because they always make their point with a neat logic that would be effective in oratory of the quiet type. A modern essayist is known by his quotations, the precious stones of the craft of criticism. Writers of the purely anthological essay, like Miss Repplier, set them in tinsel. Mr. Payne's setting is always sober and well wrought, and, if anything, errs on the side of dignity; the length of his sentences lending a certain monotony to his style.

—Monotony of quite another type pervades the essays of Mr. Gelett Burgess ('The Romance of the Commonplace,' San Francisco: Elder & Shepard), a monotony of empty verbiage, which we have searched in vain for some utterance, some view of life out of the common, that would justify the admirable get-up of the volume. One learns to distrust the exquisite parchment backs and beautiful paper and print in which certain minor writers of the day enshrine every passing thought. Mr. Burgess tells us that he is "all of a shiver with shame" at laying his "character and temperament so bare." The essays were begun in the *Lark* and continued in the safe seclusion of the *Queen*. One does not look for the imaginative eye in a persistent reader of the latter journal, and the attempt "to educate the British Matron and Young Person" by training their outlook on the commonplace might task a Stevenson. Of Stevenson we do, indeed, meet a feeble echo in these pages, in such essays as "The Manual Blessing" or "The Uncharted Sea"; but the pretensions of Mr. Burgess are too plainly revealed for art. "It was hard, indeed," he says, in his introduction, "to know when to stop, but, ragged as are my hints, I hope that in all essentials I have covered the ground and formulated the main rules of the Game of Living" (p. 3). After this the philosophy of Stevenson and the wit of Charles Lamb would hardly meet the expectations of the reader. Mere liveliness of style is inadequate for an exposition of the philosophy of life. Nor is Mr. Burgess's English beyond reproach. At the close of the essay on "Dining Out," which, if the readers of the *Queen* take their social hints to heart, must have revolutionized English suburban dinner parties, Mr. Burgess writes, "You would better not invite me anyway, for though I am no comet, yet I admit I would be mad enough to upset the claret purposely rather than have nothing exciting happen!" The use of "would" for "should" and the phrase "would better" are characteristic of Mr. Burgess, and would ruin the chances of a more subtle philosophy than his, for the strength of such essays as these lies in the manner rather than in the matter. Mr. Burgess attempts to be epigrammatic, and to stimulate the Philistine imagination; but he lacks the essential background of true wit and shrewd sense that might raise his trifling above the flimsy magazine article to the plane of the light philosophical essay.

—The American Unitarian Association, which has recently been publishing a line of books making a fresh appeal to the intellectual seriousness of the community, could hardly give us anything more alive than 'Immortality, and Other Essays,' by Charles Carroll Everett, late Professor of Theology in Harvard University, edited by Professor W. W. Fenn. Nearly all of these eight essays have the directness of compositions which have served as public addresses; two of them something of the homiletic tone, without being any the worse for that. At least four of them, "The Known and the Unknowable in Religion," "Mysticism," "The Faith of Science and the Science of Faith," and "Spencer's Reconciliation of Science and Religion," fall into a group by themselves, and were inspired or provoked by Herbert Spencer's 'First Principles.' It would have been well if the dates of their first appearance had been given; the more careful reader could then have related them better to the author's mind and to the progressive criticism of Spencer. Able and judicious as they are, they reflect the earlier rather than the later attitude of Professor Everett towards Spencer, and take no account of Spencer's lessening emphasis on "the Unknowable." The "Joseph Priestley," too, a delightful characterization, united with a frank disclosure of the differences between "the Old Unitarianism and the New," might well have borne upon its face some indication of the circumstances of its origin, those attending the dedication of a memorial tablet to Priestley in the Unitarian Church in Philadelphia, in 1889. If the essay "Immortality" is not quite convincing, it is surprising in the freshness that it brings to a subject which might, it would seem, defy originality. "The Philosophy of the Sublime" exhibits Professor Everett as he was known to those who knew him best—as much at home in æsthetic criticism as in metaphysics or theology. In the concluding essay, "The Gain of History," this gain is found, with many apt and striking illustrations, in the fact of the progressive opportunity for a larger and a fuller life. Everywhere there is an acuteness and refinement not infe-

rior to Martineau's, with frequent gleams of an irrepressible yet delicate humor to which there was nothing corresponding in Martineau's more solemn, not more serious, mind.

—There are doubtless many English readers of Dante who, not being conversant with Italian, prefer annotations in their own language. Their need is now well supplied by the commentary of Mr. H. F. Tozer, which the Clarendon Press issues in three small volumes, matching a new three-part edition of Dr. Moore's text. The notes on the "Inferno" are before us. The little book contains no preface of any kind, nor do we find in it any general presentation of the plan or the significance of Dante's poem; it begins abruptly with the interpretation of the first canto. The explanations are clear and scholarly, being compiled from good authorities—particularly, it would seem, from Toynbee, Moore, Butler, and Scartazzini. There is little in the way of original contribution, save here and there a bit of literary appreciation or comparison and an ocasional observation on prosody. The work of Italian Dante scholars is seldom utilized; there is no evidence of familiarity, for example, with D'Ovidio's masterly essays on the moral topography of hell, on Guido da Montefeltro, and on the indignation of Virgil in the pit of the soothsayers. A striking feature of the work —indicating probably that it was intended rather for the casual reader than for the student—is the summary fashion in which great unsolved problems are disposed of, while minor difficulties are often elaborately elucidated. The three beasts of the opening canto are dismissed in eight lines, with no hint of the vast controversy that has raged over their interpretation; whereas the symbolism of the wolf in Ugolino's dream receives more than sixteen lines, and Anastasius II., one of the least conspicuous personages in the 'Commedia,' gets fifteen. The year and day of the mystic journey, the *veltro*, the messenger from heaven (ix., 85), the *corda* (xvi., 106), are scantly dealt with; and the apparently hopeless and fundamental inconsistency in the descriptions of the *pozzo* (the Ninth Circle) is not even mentioned. Similarly, the *amara* of i., 7, the *tuono* of iv., 2, the *vedea la notte* of xxvi., 128, are simply expounded according to the annotator's preference, without a suggestion of a possible alternative. On the other hand, Pluto, Phlegyas, the Furies and Medusa, Thais are satisfactorily though concisely discussed; and there are excellent comments on *di te mi loderò* (ii., 74), the adventure of Alexander in "quelle parti calde d'India" (xiv., 31), the "campion nudi ed unti" (xvi., 22), the simile of the frost at the beginning of xxiv., and the twenty-two-mile circumference of the next-to-last *bolgia* (xxix., 9). Some small inaccuracies might be pointed out, but they are not of sufficient importance to call for mention here.

ARMSTRONG'S CHARLES V.

The Emperor Charles V. By Edward Armstrong, M.A. In two volumes (pp. 341, 413). The Macmillan Co. 1902.

Biographies of Charles V. are far less numerous than one might expect, on general grounds, that they would be. Into every account of the Lutheran revolution his name and policy must by compulsion enter, nor can his presence be lost sight of for a moment when we are dealing with French politics, or Spanish colonies, or Flemish commerce, or Italian warfare, or English relations with the Continent, during the first half of the sixteenth century. But while his career and his attitude towards public questions are thus leading factors in a thousand books, the list of special biographies remains remarkably small. There are a good many monographs on the different phases of his activity and on the character of his rule in the separate parts of his dominions, yet even by the French and Germans his life has been treated as a thing of fragments. At first sight this fact may seem surprising, though on the slightest reflection the causes of such neglect cannot fail to appear. In the first place, the Emperor's interests were so scattered and so conflicting that most writers are alarmed at the prospect of a baffling complexity; and, furthermore, the personality of Charles is not likely to attract those historical artists who are on the watch for types of great virtue or colossal guilt. He was simply a man of mixed qualities and mediocre talents, whose part in the world's action was fixed by circumstances beyond the measure of his powers. The general feeling about him is expressed by Green in one of his letters to Freeman: "Charles V. is a mere hook to hang history on. Luther is the soul of *that* time."

While biographers in general have thus shunned the subject of Charles V., Great Britain can point to Robertson, whose history of this Emperor has been a famous book for more than a hundred years. It is the only work on the reign in our language to which the bibliography of Lavisse and Rambaud refers, and Mr. Armstrong adds, "No biography of the Emperor has been written in English since the great work of Robertson." Concerning the Scottish historian, however, we shall say little, since he lived in the eighteenth century. Such were his methods and such was his style that he does not come into comparison with Mr. Armstrong at all. One other biography of Charles V., and to our knowledge one alone, can be used with any profit for purposes of contrast. We refer to the 'Geschichte Karls V.' of the late Hermann Baumgarten. Unfortunately, it is incomplete, for though three volumes were published, death prevented the author from writing the other two, which would have described the Schmalkaldic War and the Emperor's last years. For the period 1500-1539, Baumgarten has four pages to Mr. Armstrong's one; nevertheless, he furnishes the best standard of comparison that is available. For ourselves, we have neither the time nor the disposition to apply the parallel method of examination and criticism. It will be enough to glance, here and there, at features of difference which mark off the English biography from its German predecessor.

In respect to length, Mr. Armstrong is much more moderate than Baumgarten. He assures us that he could have written six volumes with greater ease than two, and no one who is familiar with the field or with the ordinary processes of composition will think this statement an exaggeration. His researches, as one can see after the first hour, have been wide and thorough. Beyond doubt he has cast aside much more material than he has used. The residuum, therefore, represents careful selection and a conscious effort to achieve artistic success. It is far better to be concise than unwieldy, but in some respects Mr. Armstrong has carried compression too far. As we shall point out before we close, he has not neglected the device of epigram, and sprightliness is a leading feature of his style. At the same time the element of political detail makes itself somewhat more prominent than the unprofessional reader would have it, and in consequence other things seem rather crowded. We recognize the extreme difficulty of the problem, and we think that Mr. Armstrong has been wise in keeping his book compact. One question alone arises: Would it not have been better to put so short a sketch wholly in essay form, and to use even a broader brush? Despite great cleverness and a literary skill which in some directions is very marked, neither of the two volumes is altogether easy to read. This is perhaps due to the cause that has been suggested.

Any life of Charles V. must be complex, and where there is complexity, we need to test the author's power of arrangement. Here Mr. Armstrong shows a skill which is not so evident in Baumgarten. As he explains his views on this subject, we shall let him describe them for himself:

> "In the history of Charles V., the method of strict chronological sequence would be peculiarly perplexing, because the vertical bars between the several sections of his interests are singularly thick, although not thick enough to produce total isolation. The condition of the Spanish-American colonies, for example, did really affect the Emperor's fortunes in relation to the duchy of Milan; the campaign in North Africa did actually modify the current of events in Germany. Yet it would be confusing if contemporary incidents in these four countries were perpetually brought together in succeeding paragraphs. Hence it is that by way of compromise I have treated the main occurrences of Charles V.'s life more or less in the order of time, but have relegated to separate chapters the more outlying spheres of policy or action."

We give prominence to the foregoing statement because Mr. Armstrong is threading a labyrinth, and we need to know the character of his guiding-line.

If a biographer of Charles V. is likely to lose his way in the maze of conflicting issues and international entanglements, the reviewer of the biography is threatened, *à fortiori*, by the same danger. Ten columns would soon be exhausted were such subjects brought forward as the Emperor's trouble with the Cortes, his diplomatic intercourse with the Curia, and his various campaigns against Francis I. These and all other matters of a purely political character we shall put to one side for the sake of discussing two questions—the attitude which Charles adopted to the Reformation, and Mr. Armstrong's delineation of personal traits.

In thus singling out the religious issue, we may point to the fact that Mr. Armstrong recognizes its supreme importance among all the complications of the reign. Shunning paradox, he does not exalt the political element or the motive of national rivalry between France and Spain, but is conservative enough to look upon the Lutheran revolt as the essential problem of the Emperor's career.

"At the Diet of Worms," he says, "was

cast the horoscope of Charles, or rather, perhaps, the first five months of 1521 traced upon the youthful palm the lines of future life. Here best can be appreciated the unity in diversity of the Emperor's tasks. The two irreconcilable foes of the future now met face to face, and for the only time; orthodox emperor and heretic monk, each definitely took position in the decisive struggle of the reign."

Without denying that the Diet of Worms was Luther's greatest moment, Mr. Armstrong maintains that it was also a great moment for Charles V. Hitherto he had been in leading-strings. On the occasion of his first visit to Spain he was thought the puppet of his minister, Guillaume de Croy, the Wallon Lord of Chièvres. When a youth who had sat "spell-bound under the ferule of Chièvres" suddenly became master of himself and electrified the whole Diet by his firm denunciation of Luther, a step towards manhood had been taken fast. On the first day the heretic entered Charles's presence with a nervous smile; on the second, he denounced the Pope in terms which gave every sign of renewed self-confidence; and on the third, the Emperor handed to the princes a statement of his decision.

"A single monk, led astray by private judgment, has set himself against the faith held by all Christians for a thousand years and more, and impudently concludes that all Christians up till now have erred. I have therefore resolved to stake upon this cause all my dominions, my friends, my body and my blood, my life and my soul. For myself and you, sprung from the holy German nation, appointed by peculiar privilege defenders of the faith, it would be a grievous disgrace, an eternal stain upon ourselves and our posterity, if in this our day, not only heresy, but its very suspicion, were due to our neglect."

Luther had blown a loud blast, but not for the first time. Charles V. (aged twenty-one) wound his horn boldly in reply, and, though it was the note of a novice, it came more truly from the heart than any other proclamation of the reign.

Mr. Armstrong, in praising the Emperor's courage, gives him credit also for originality. This defiance of Luther was his unassisted work, and it must also be remembered that Charles was not arrayed at Worms with all the authority of a despot. According to Mr. Armstrong's view, he was quite as much on the defensive as Luther could have been. The monk had made himself the idol of Germany. The Emperor had few friends, was threatened by the knights, and lacked the means of carrying out the projects which were forced upon him by his international position. Yet, despite the difficulties wherewith he was surrounded and a native hesitancy to act in haste, he uttered his decision boldly. He found Luther antipathetic, and the encounter developed a spirit of self-assertion.

"Reserved as Charles was," Mr. Armstrong says, "the shock struck out the most outspoken confession of his faith that he ever uttered. Nowhere else is it possible to approach so closely to the workings of his spiritual nature, save in the confidential letters to his brother in the last troubled hours of rule, when he repeated that it was not in his conscience to rend the seamless mantle of the Church."

But over against this unequivocal statement of Worms there stand the procrastination of twenty-five years and the sack of Rome. The latter question we shall not attempt to discuss, for it would lead us into much detail. According to Mr. Armstrong, "whatever method be adopted for the treatment of the Emperor's biography, the most refractory element to handle is the Pope." A notice of Charles's action in 1527 would soon lead us beyond Clement VII., and involve us in the deepest mysteries of imperial negotiation. But while we are unable to grapple with the problem which is suggested by the sack of Rome, the spectacle of the Emperor's delay in attacking the Protestants brings us to a general estimate of his character.

The last and by far the most interesting chapter of these two volumes deals with personal traits. Within the compass of twenty pages Mr. Armstrong depicts those qualities which, in his opinion, conditioned the course of Charles's difficult, contradictory, and unsuccessful career. If we could condense the chief features of this portrait into a short paragraph, we should do so, but such a feat is quite impossible. We shall simply give Mr. Armstrong's most compact statement in his own words, and indicate its bearing upon the issue of the Reformation.

"The essential characteristics of Charles V.," he says, "were honesty of purpose, warped by self-interest to the extent that he could persuade himself at times that his own way was the right way; industry, interrupted by fits of indolence, or rather, perhaps, natural indolence thrust backwards by a sense of duty occasionally intermittent; self-control, ruffled, though rarely, by sudden squalls of passion; irresolution relieved by quick resolves, which chose sometimes the right amount, sometimes the wrong, both a little at haphazard; obstinacy, which is so strange and yet so frequent a yoke-fellow to irresolution."

It is this last phrase which gives us the secret of Charles's strange attitude towards the Protestant movement in its infancy and towards the whole problem of the Lutheran schism. His preference was as he expressed it at Worms, and he never lost sight of the original proposition. If he postponed the moment of his attack upon the Schmalkaldic League, he none the less was biding his time. Furthermore, he could never put his first design of repression from him, and even in his closing years he opposed the *modus vivendi* which both Lutheran and Catholic princes desired to accept.

For the rest, Mr. Armstrong sees in Charles V. neither a statesman nor a hero, but, "all deductions made, an honorable Christian gentleman, striving, in spite of physical defects, moral temptations, and political impossibilities, to do his duty in that state of life to which an unkind Providence had called him." The biographer who has proved the difficulties of the Emperor's career by trying to describe it, naturally leans towards charity.

We have already said that Mr. Armstrong enlivens his narrative with a profusion of striking phrases. These form, indeed, a conspicuous feature of the work. We give a few examples. "At his first tournament in Spain the young king's shield bore, not the adventurous *Plus oultre*, but the more modest *Nondum*. The life of Charles henceforth was to seek alternate guidance from these same two legends, Yet further and Not yet." "Flattery, whose function is to place an exaggerated emphasis on truth." "His name is scarcely mentioned in dispatches, save as a minnow to be spun in the preserved waters of royal matrimony." "Hutten from his watch-tower barked louder than ever, but his barks were apologies for not biting." "Necessity, the omnipresent anarchist." "If ever he sported with Amaryllis, it was in the shade." We might multiply these smart sayings indefinitely. Every page has its plum, and though some are better than others, the average quality is good.

Without calling Mr. Armstrong flippant or cynical, we must confess that his air of candor has at times impressed us unfavorably. Thus, when he has occasion to mention the outbreak of war between Charles V. and Francis I., he writes:

"How wise is Machiavelli's statement of the only true *casus belli*—'the war which is necessary is just.' Yet in every century the would-be combatants have ransacked brains and pigeon-holes for justification of the combat which needed none, save the determination to fight engendered by inevitable collision of temperaments or interests. This is due, of course, to an uneasy feeling that war is sinful, or at the least extravagant, and [that] those who break moral or economic laws must plead extenuating circumstances."

Whether this is jingoism appealing to history, we shall not attempt to say, but we must range ourselves in opposition to a sentiment which would well agree with conditions of thought in the tenth century.

On the whole, Mr. Armstrong's 'Charles V.' is a bright, learned, and indispensable work.

JOHNSTON'S UGANDA PROTECTORATE.

The Uganda Protectorate: An Attempt to give some description of the Physical Geography, Botany, Zoölogy, Anthropology, Languages, and History of the Territories under British Protection in East Central Africa. By Sir Harry Johnston, G.C.M.G., K.C.B. In two volumes. With 506 illustrations from drawings and photographs, 48 full-page colored plates, and 9 maps. Dodd, Mead & Co. 1902. Large 8vo. Pp. xix, 1,018.

"The Recreations of a Special Commissioner" would be an appropriate sub-title for these remarkable volumes, for it was in this capacity that the author went to Uganda in 1899 to reorganize the administrative affairs of the Protectorate. This work took twenty months, during which he travelled extensively in the different provinces, finding his relaxation when his official duties were over, in collecting information about the land and its inhabitants, and in photographing and painting. The fruit of these leisure-hour occupations is a monumental work on one of the most interesting countries in the world. Within an area about equal to that of Montana there are to be found alpine, temperate, and tropical regions, with their distinguishing characteristics of climate, vegetation, and life. In it are the highest mountain and the largest lake in Africa, waterless deserts, vast marshes, snowfields, and glaciers, and land unsurpassed in fertility. From the windows of a Uganda Railway car the traveller can see, as the train crosses certain tracts, "rhinoceroses, sometimes even elephants, zebras, gnus, hartebeests, gazelles, reedbuck, waterbuck, oribi, and ostriches," while the human race is represented by every type, from the forest pygmy, hardly to be distinguished from the ape, up to Apolo, prime minister and historian of his people.

Sir Harry Johnston does not attempt to put the results of his investigations into a popular literary form, and they hardly

admit of such treatment. But his work is not a mere dry repertory of scientific facts. Personal touches, incidents of his travels, constantly enliven the account of the physical features of the land, its fauna and flora, and its inhabitants. His artist nature makes him keenly alive to the wonderful beauty of a "country where bird, butterfly, and flower—even earthworms—unite to display under brilliant sunshine all the primary colors and many of their most exquisite blendings." In the enjoyment of this beauty he successfully endeavors to enable his readers to share, not only by his glowing descriptions of lake, forest, and mountain scenery, but also by reproducing many of his paintings in color, and a great number of his photographs. His landscapes are somewhat harsh, but his bird and animal drawings are of great and unusual merit. The photographs illustrate nearly every important statement in the text admitting of a material representation. It would be difficult, indeed, to find another work of this kind where illustrations of such a high order have been so judiciously chosen and so generously used. There are also nine physical, ethnological, and political maps.

The opening chapters aim to give "some idea of the general aspect of the Protectorate," from which it appears that, except in the immediate vicinity of the railway and in parts of Uganda proper, there are no signs of civilization. Some large tracts, and those the best suited for European colonization, are without "a single *settled* native inhabitant," and here and there "may be seen large herds of giraffes as one might see cattle peacefully standing about in an English park." Perhaps the most interesting spot, from its associations and its beauty, is the "birthplace of the Nile," where the waters of the Victoria Nyanza begin their long course to the sea in a fall of some thirty feet. A winding path leads to the water's edge immediately below the fall, and here, "in perfect safety, one may peep upwards through the welcome shade of overhanging trees into the awful green arch of water that is streaming over the unseen step. As you watch the descent of this tremendous cascade, you can see large fish, as though they were enclosed in thick glass or in aspic, being carried down the descent of water."

An attack of fever necessitating a change of climate, instead of returning to England Sir Harry adventurously explored the Ruwenzori range, climbing to a height of 14,828 feet, or nearly 2,000 feet above the snow-line. Yet at this point "the mountain above me seemed a thing I had only begun to climb, and towered, so far as I could estimate, another 6,000 feet into the dark blue heavens." The chapter, with its striking illustrations, describing these equatorial snowfields and glaciers and the wonderful vegetation below them, is the best account we have of Ptolemy's mysterious "Mountains of the Moon." In some respects the same is true of the description of the great Congo forest, whither Sir Harry went to take back to their homes some pygmies whom a German had kidnapped for exhibition in Paris. Here he procured pieces of the skin of the newly discovered quadruped, the okapi, of which he gives a tentative drawing. He calls it hornless, but, from a skeleton recently received in Belgium, it appears that there is another form of the animal, horned in the male and hornless in the female. This excursion into the Free State gives our Englishman the opportunity of testifying to the prosperity of the natives of this region under the "excellent administration" of the Belgian officials. Their villages were remarkably tidy, their houses well-built and comfortable, and they "repeatedly and without solicitation on my part compared the good times they were now having to the misery and terror which preceded them when the Arabs and Manyema had established themselves in the country as chiefs and slave-traders."

A sketch of the history of the Protectorate and its present methods of government is followed by a suggestive review of its commercial prospects. These are not brilliant if the country is administered solely in the interests of its inhabitants. Sir Harry strongly condemns the French and Belgian policy of granting large territorial concessions to companies which are certain, in seeking their own gain, to ignore native rights and industries. There has been no discovery as yet of great mineral wealth, but coffee, sugar, cotton, and grain can be cultivated, and there are valuable assets in timber, India rubber, and ivory. A single fact will suffice to show the capacity of the soil. A wild tomato plant left by chance when a Government compound was weeded, bore in two months 3,000 fruits. "It still goes on bearing clusters of lovely fruits, and covers a space of twenty feet square." Should the natives be encouraged to develop these resources, Sir Harry believes that in time they will pay not only the cost of the Government, but also the fifty million dollars which Great Britain has spent in the acquisition and improvement of the country. He also advocates permitting the natives, under strict regulations, to seek employment in British South Africa. An unknown factor in the problem of the future is the existence of a great uninhabited tract, the Nandi Plateau, "a land abundantly watered by running streams, with grassy downs, splendid forests of conifers, a fertile soil, and a country which, though exactly under the equator, is singularly like the landscapes of southern England," and which, if it were in Australia, "would maintain a prosperous European population of 500,000 souls."

The latter part of the first volume contains botanical and zoölogical notes, with lists of the author's collections compiled by scientific experts. The wealth and variety of the animal life to which reference has been made is characteristic also of the bird life. "On Lake Hannington," for instance, "it is no exaggeration to say that there must be close upon a million flamingoes. . . . Seen from above, this mass of birds on its shoreward side is gray-white, then becomes white in the middle, and has a lakeward ring of the most exquisite rose-pink, the reason being that the birds on the outer edge of the semicircle are the young ones, while those farthest out into the lake are the oldest." The common notion that the notes of the tropical birds are unmusical is refuted by the statement that in Uganda "one's ear is constantly delighted with the songs of thrushes, warblers, and bulbuls." But Sir Harry's chief interest is in man, and the facts which he has gathered in regard to the different native races of the Protectorate, illustrated by more than two hundred photographs and taking up the whole of the second volume, have an absolutely unique value to the anthropologist. His theories in regard to the origin, affinities, and migrations of these peoples are the results of investigations pursued during nearly twenty years spent in Africa as an explorer and Government official. The most interesting from a purely scientific point of view is that human enigma, the forest pygmy, the prototype of Puck, Robin Goodfellow, and the elves and fairies of our nursery tales. In his brutish life far below the other natives, in morality and intelligence he is far above most of them. Without any known language, he learns with ease and rapidity the language of his neighbors. He can draw the beasts and birds with which he is familiar, sings "many different songs, some of which have a melody obvious even to European ears, a strophe and antistrophe, a solo part and a chorus," and his dances are full of variety. It would seem as if he had an appreciation of the beauty of nature. Sir Harry says: "I have never once heard a pure-blooded Negro in Africa express admiration for a beautiful or bright-colored flower, though I have seen the little Congo pygmies occasionally pick off small blossoms and thrust them by the stalk into the holes which they have bored in their upper lips." Of the pygmy's possessing a still higher trait there can be no doubt.

"If gifts in the shape of ripe bananas are laid out in a likely spot for the pygmy visitor who comes silently in the darkness or dawn, the little man will show himself grateful, and will leave behind him some night a return present of meat, or he will be found to have cleared the plantation of weeds, to have set traps, to have driven off apes, baboons, or elephants whilst his friends and hosts were sleeping."

The most promising people, however, are the Baganda, who, from the earnestness with which they are striving after the civilization of the whites, may justly be called the Japanese of Central Africa. Though it is only twenty years since the first native openly professed the Christian faith, there are now 1,070 Protestant church buildings. The foundations of a literature have been laid, and a history of the country by a native, in his own language, has been published. The people have a printing establishment, which issues a little paper, and industrial schools. Good roads are being built, and their towns are a "series of villa residences surrounded by luxuriant gardens." Another title to comparison with the Japanese is their delightful politeness and tact. Apparently more than once Sir Harry, in his tours through the province, found at the top of some particularly high hill, which he had climbed with difficulty to visit a native chief, "a table spread with a snowy white cloth, and set out with tea things." There were camp chairs, a fire over which a kettle was boiling, and a group of smiling, white-clothed attendants.

"All these preparations have been made without consulting the traveller by the chief or the sub-chief of the district, very possibly not even the one he is going to visit. It has been guessed that the white man will find this hill the most trying point in his day's journey during the heat of the afternoon sun, and therefore this spot has been selected as the most suitable one to prepare tea to cheer him on his way. Very possibly one may only guess all this, as

the attendants, like well-trained English servants, offer no conversation unsolicited; and, with their inborn tact, the chiefs are not there to worry you with compliments or greetings."

A few of the many traditions and folk-lore stories of the Baganda are given, in one of which it is said that to propitiate God's wrath at the disobedience of their first king, Kintu, it was decreed "that nobody should work on every seventh day, and on the first day of each new moon." With a chapter on the six groups of languages spoken in the Protectorate and vocabularies of fifty of these languages and dialects, Sir Harry Johnston concludes his work. In his preface he makes grateful acknowledgment of "the help and coöperation of many friends and colleagues who have placed their stores of information at my disposal." Intelligent interest in the people whom they govern is not rare in British officials, and to it is largely due their success in building the empire.

GUMMERE'S BEGINNINGS OF POETRY.

The Beginnings of Poetry. By Francis B. Gummere, Professor of English in Haverford College. Macmillan Co. 1901. 8vo, pp. x., 483.

It is a matter of ordinary observation that the biological sciences in propounding and, to a certain extent at least, establishing the doctrine of evolution, have introduced a new category into philosophy, and profoundly modified the attitude of mind with which the contemporary scholar or thinker approaches the problems that belong to his field of inquiry. Since we are now taught to believe that all higher forms, not only of material things which change and perish, but also of intellectual life, have had their beginnings in lower and more elementary stages of existence, no phase of savage life is considered too ignoble to merit the reverent study of the historian of any of the manifold forms of human activity. Of this spirit Mr. Gummere's book is a striking example. It is redundant with phrases like "fissiparous birth" and "curve of evolution."

"Poetry," we read on page 347, "like all human institutions, like the earth itself, goes back to rude and barren beginnings; and the lowest stratum of poetry to which one can come, either by sight or inference, is only what one ought to expect from the doctrine of evolution, applicable in this case as in any other case."

The poets, however, have always shown a very scant respect for the rude efforts of primitive bards. Ennius, himself considered by the Romans of a polite age as the uncouth genius of semi-barbarism, speaks with haughty disdain of his own poetic forebears who had not succeeded in scaling the rugged heights that lead to the abode of the Muses:

"Scripsere alii rem
Versibus, quos olim Fauni vatesque canebant,
Cum neque Musarum scopulos quisquam superarat,
Nec dicti studiosus erat."

But Mr. Gummere declares that

"not the bard come down from Olympus, with majesty in his mien and the light of divine song shed about him, singing to his rapt hearers of the deep things of life, is the nobler view; nobler by far is the sight of those little groups gathered on the marches that lay between the old beast and the new man, facing inexorable powers which had crushed out life upon life before, and whole systems of life. . . . The first cry of emotional consent along with the consenting step, the cry that remembered a triumph found in instinctive common action, and felt itself to be prophetic of a triumph yet to come—this concerted step and shout, which seemed the expression of concerted purpose, of communal will, force, effectiveness, has more in it even for the man of sentiment than can be found in any flight of poetry in later time."

In chapter second, on "Rhythm as the Essential Fact of Poetry," the spirit and intent of the whole book are first plainly apparent, and may at once serve to warn those who uphold the transcendental idea of poetry. Rhythm, according to this title and treatment, is not *an* essential fact of poetry, but *the* essential fact of poetry. In a long and instructive historical argument, Mr. Gummere proves that critics who have protested that rhythm is not an essential condition of the poetic art, have been in the main inconsistent with themselves and each other, and have never established a criterion of enduring value. None the less, these protestations, however illogical and however weak on the synthetic side, represent a real instinct for the truth. Inasmuch as all must feel that rhythm is only the outward form and not the inner essence of the poem truly great, how can any investigation of rhythm, except to a limited degree, bear upon the subject of poetry properly so-called, or how can the first manifestations of man's rhythmical instinct in the meaningless shouts that accompanied the primitive dance be called the beginnings of poetry?

The chapter on "The Two Elements in Poetry" contains a statement and preliminary defence of one of the author's main contentions, namely, that in primitive poetry there was an entire absence of individual composition. The two elements of the title are, to put it briefly, nature and art. Natural poetry, he thinks, was composed by the folk as a whole; artistic poetry, after an era of sophistication and self-consciousness had set in, by individual poets. Inasmuch as none would be found to deny that all art has received more of the artistic quality in the course of civilization, we restrict ourselves to what is said about natural or "communal" poetry, as Mr. Gummere is fond of calling it. This theme is treated in a chapter of portentous length, entitled "The Differencing Elements of Communal Poetry." Here we find, invested with a great wealth of illustration derived from anthropological studies of primitive societies, the gist of the author's theories about the beginnings of poetry, which we venture to state as follows:

The earliest form of verse was the communal chorus, accompanied by song and dance, of which the predominating characteristic was mere repetition. As instances of extreme simplicity may be cited the choruses of some African tribes, which consist of a single word, and of the Fuegians, who often sing not so much as a word, but only a syllable, repeated for hours. The first growth out of this crude and amorphous state was the ballad, which was the first literary form really to deserve the name, and which contained the germs of epic, lyric, and dramatic poetry. Starting from the fact of the widespread if not universal gift of improvisation among savages, as attested by modern travellers, and from a similar gift observable among European peasants of to-day, Mr. Gummere proceeds to the conclusion that, in the pristine singing and dancing throng, anybody and everybody gave utterance to verses impromptu, which, alternating with a refrain sung by the whole chorus, and still, as the name ballad indicates, accompanied by dancing, made up the ballad in its earliest form.

If this indeed be a true genetic account of early poetry, surely this primitive ballad, in which individuals successively stepped out of the dancing throng to recite their improvised verses, was strongly dramatic in character, and this should have been stated as one of its most distinguishing marks. The action of the ballads that have come down to us as literary relics—those in Professor Child's collection, for example—is almost always presented in dramatic form. In his later chapter on "The Earliest Differentiations of Poetry," Mr. Gummere admits Aristotle's assertion ('Poetics,' Ch. IV.) that the drama, in both its estates of tragedy and comedy, was at first mere improvisation. But he contends that dramatic, like lyric and epic, poetry was derived from the communal chorus; whereas we conceive the fact to be that this primitive chorus was from the first almost a drama. From its narrative portions was differentiated the epic, which retained many a trace of dialogue rendering. The original choral ballad needed but few changes to transform it into a drama; and Greek tragedy, as is well known, kept the lyric element as a separate, detachable form within itself, and still contained the epic narrative in solution. From these facts it is not a remote conjecture that individual improvisation gave rise to the first verses that bore any resemblance to what cultured men call poetry. It is hard to believe, and cannot be proved, that the folk as a whole, by what Mr. Gummere calls "communal consent," ever made any rhythmical utterance beyond a meaningless or almost meaningless refrain.

Our serious objection to Mr. Gummere's treatise as a whole is that, in his devotion to scientific research and to the evolutional argument, he too often forgets that such procedure can touch only the barest mechanism of poetry, whose true essence is as incapable of analysis as that human soul of which it is the highest expression. In his last chapter he uneasily asks himself if, after all, the primitive verse of communal consent is one and the same thing with the poetry of art. Answering this question in the affirmative, he finds in rhythm the surviving representative of communal forces. That is to say, had rhythm not existed in communal verse, it would not now be found in the poetry of the individual artist. But rhythm is a much more important factor in the life of an individual than in that of a community. It is a commonplace of modern psychology, that not only rhythmical action and utterance, but also rhythmical perception, are necessary conditions of man's existence.

Instances of the author's faith in the methodology of natural science abound, but the one which has most excited our admiration is the following:

"All that we ask of biology is the concession of instinct; at the basis of human poetry, that vast edifice of art, and, as it seems to the modern man, of nothing but art, lie instinctive utterances, homogeneous, if one may judge by chick and bird (!), and subject to their first modifications not

from individual effort, but from social consent and the enormous force of communal emotion."

The assumption that lies at the root of such generalizations is plainly that the nearer we can get to primary and simple experiences and concepts, the nearer we are to reality; in other words, that the standard of reality must consist in that which appears to lie at the beginning of knowledge. Hence Mr. Gummere, judging from what he finds to be among primitive races the most rudimentary forms of metrical composition, concludes that rhythm, social consent, and the like, are the essential facts of poetry. Thus he makes no account of the demands of that higher synthesis which insists upon holding to the ultimate and most complex forms of experience as the standard of reality, and regards as mere accidents such circumstances as simplicity of manifestation and priority of time.

It is unfortunate that, in a work involving so much detail, the table of contents and index should be so very meagre. Students who consult the index under the words "Chorus" or "Dance," for example, will find many passages cited by page, but no information as to the particular phases of the subject with which those passages are severally concerned. We have noted a few minor errors. On page 405 the statement is made that "the Roman and Oscan farmers improvised such [amœbean] songs in their *satura* and in their rough comedies." But the fact is that the *satura* was not improvised at all, and this lack of improvisation constituted, so far as we can make out, its sole difference from the Fescennine verses, which were a rude, extemporaneous, dramatic dialogue. Prof. H. W. Smyth's name is misspelled Smythe in the index, and in every place in the book to which the index refers. We should not know where to look in Aristophanes's "Clouds" for act v., scene 11, as a citation is given in a note on page 270. On page 21 it is said that a certain tendency gives rise to "a notion *never true and often false*"!

A History of the American People. By Woodrow Wilson. In five volumes. Harper & Brothers. 1902.

It is, perhaps, not wholly unnatural that an elaborately illustrated historical work, written in the first instance for a popular magazine, should be viewed by many with some suspicion. It is so easy, by means of heavy paper, large type, wide margins, numerous pictures, and fine binding, to give an air of importance to what is, after all, of but minor value that the critic, particularly if his taste be that of the scholar rather than the general reader, is prone to look upon all such undertakings as presumptively wanting in merit. Here, for example, is a work in five large volumes, handsomely printed and bound, profusely illustrated, and making, in general, an appearance of which any booklover might be proud. It professes to be a history of the American people from the discovery of the continent to the very present. Yet it contains only about two-thirds as many words as Green's 'Short History.' Unquestionably, the predisposition of the critic is not likely to be favorable.

Nevertheless, subject to some rather important qualifications, the general verdict on President Wilson's book must, we think, be commendatory. The author has not thus far been especially prominent as an historian, but has won repute rather as a keen observer of political and governmental conditions, a successful popularizer of scholarly knowledge, and an essayist with a peculiarly vivid and picturesque style; and it is in these same capacities that he appears in this his latest book. The student who is searching for a concise and comprehensive narrative of historical events, a careful marshalling of facts and weighing of evidence, or a bringing together of tested and assured information from monographs and documents, will not find any of these things here. No existing history of high quality will be superseded by President Wilson's work, nor need any would-be writer of American history on a large scale be deterred from prosecuting his undertaking to its completion. What the author has given us is, rather, a brilliantly written essay summarizing the general course of events, with only so much of selected incident as is needed to hold the narrative together and make the reader feel that he knows what the author is talking about.

The defects are, naturally, those of the qualities. It is inevitable that, in writing of this character, comment and opinion should preponderate over fact, and that, so far as the average reader is concerned, much should throughout be taken for granted. The inquirer who should turn to President Wilson's pages for what the author himself might call "mere information," would hardly succeed in finding a great deal of it; but if he have his information well in hand in advance, he will find much to admire and not a little worth thinking about in the broad outlines, the sweeping generalizations, the keen judgments, and the illuminating comments with which the pages abound. Further, with a writer as interesting as President Wilson, there is at times the feeling that something has been sacrificed to form and grouping, that events were not always quite as clear as they are made to seem, and that the emphasis is often as much personal as historical. One must not be disturbed, for example, at finding the witchcraft delusion disposed of in half a page of text, or at seeing Garrison shot suddenly into the field, and for the first time, in 1345. In other words, President Wilson's work is to be commended as a useful stimulant for those who already know a good deal about American history, but hardly as a safe "short cut" for those who begrudge the acquisition of knowledge in the old-fashioned way. To say that the generalizations and summaries are, as a rule, both safe and informing and that the apportionment of space does not, in the main, greatly distort the relations of things, is only to say again that the achievement is praiseworthy.

A well-known writer and teacher declared, a few years ago, that no one might now expect to live long enough to write, on a large and comprehensive scale, a history of the American people. President Wilson has not, as we have said, attempted this alleged impossible task in the way which the speaker had in mind. There is nothing in either the matter or the manner of his book to indicate any extensive first-hand acquaintance with the subject; but the important secondary literature seems to have been industriously used, while numerous references or statements show that the monographic work of specialists has not been neglected. Occasionally there is a slip, as where the old charge that Braddock "walked into an ambush" is given another lease of life; but such errors, so far as we have noted, are rare. In one respect especially the treatment is notable. Throughout the whole of the colonial period President Wilson is constantly calling attention to the course of events in Europe, and to the inseparable connection between European history and American history. The history of the Navigation Acts, in particular, is followed with unusual closeness, and again and again recurred to, with the conclusion that their influence on American trade was not disastrous, and that England was obviously as much interested in developing the colonial trade as in taxing it. This point of view, not as yet very generally taken, helps to clarify very much this part of the subject. Similarly, the handling of the causes of the Revolution is broad and firm, without going to either of the extremes which such writers as Mr. Lodge and Mr. Trevelyan may be taken as representing. Readers of the author's 'Division and Reunion' will recognize the same general attitude in the account of the earlier Constitutional period here. Coming down to recent events, the brief account of the war with Spain foreshadows the more critical temper which will not honor as heroes all who participated in that struggle, while the characterization of President McKinley may well give somewhat of a chill to the admirers of that subservient leader. It was difficult for a president of Princeton to write at once truly and discreetly of President Cleveland, but President Wilson has acquitted himself with rare tact and reserve.

In the selection of the hundreds of illustrations, President Wilson acknowledges his indebtedness to Mr. Victor H. Paltsits of the New York Public Library. For the selection and mechanical reproduction of the pictures there can be, in general, nothing but praise. It is a pity, however, that fancy pictures, save, perhaps, the few that are in themselves notable works of art, could not have been excluded, and that a fuller indication of origin could not have been given than is afforded by the oft-recurring ascription, "from an old print." It was a happy thought to present, as the frontispiece of the first volume, the fine photogravure of Sir Edwin Sandys, than whom no man better deserves recognition as the friend and aider of American colonization. Occasionally an illustration is out of place—thus, in volume ii., the picture of the Plains of Abraham, on page 86, is inserted in the account of Braddock's campaign; and the picture of Washington and Rochambeau at Yorktown, on page 306, precedes by twenty pages the account of the operations depicted. A picture of Carpenter's Hall, Philadelphia, is set into page 11 of volume iv., although the text relates to the beginning of Jackson's administration. The picture (vol. iv., p. 184) of the Dunker Church "where John Brown preached the night of the raid," is a curious lapsus, since the incident referred to did not occur.

Appended to the several divisions of the narrative are select bibliographies giving the titles of both primary and secondary works. We cannot imagine that any considerable number of those who will read President Wilson's volumes will have use

for the bibliographies, but it is the fashion to have them even in popular works, and they at least suggest the possibility of further study. The lists are laudably free from worthless books, and the range is fairly comprehensive. There are unexpected omissions, of course. The bibliography of Carolina, for example, makes no mention of Mr. McCrady's history, nor does that of Virginia include Bruce's 'Economic History' or Brown's 'First Republic in America.' The most extraordinary omission is that of Parkman, who is not mentioned in the list of authorities (vol. ii., p. 96) on the French and Indian wars. With the numerous references to sources in the bibliographies, further, one does not expect to find the texts of a few appended documents reprinted from Preston's collection instead of from some authoritative source.

The Taskmasters. By George Kibbe Turner. (First Novel Series.) McClure, Phillips & Co.

Oldfield. By Nancy Huston Banks. The Macmillan Co.

'The Taskmasters' deals with the political conditions of a New England manufacturing town in the eighties, and sets forth plain truths as to the so-called independence of the voter whose bread depends on the millowner. To John Mayhew the relation interpreted itself as that of "the lord and his retainers, feudalism returned —the hard industrial feudalism of New England." The Grimdale brewery, as it figured in Grimdale politics, is forcibly arraigned as "mother of sin and foolishness"—owning the "poor, silly, mortgaged saloon-keepers," who are "bound round and round, owned body and soul now and hereafter." The eternal controversy between employer and employed furnishes the motive for the tragic episode of the story, as indeed for the story itself, which is not all tragic. Both sides—capital's and labor's —have a hearing. "All I ask for is a show," says the unjustly discharged millhand. "You'll hear a good deal about cheap labor coming in and driving out the old. . . . Well, they don't drive 'em to anything worse, do they? They push 'em up all the time into better things," says the capitalist, the "gray old fatalist who saw and thought in multitudes and races." "Man's whole advance has been but trifling, indeed; but no mere foolish sentimental pessimism should underestimate the accomplishment of this last half-century," is the hero's reflection as he reviews the subject. In a word, this book is a thoughtful, eager, even impassioned statement of both sides of that puzzle whose only solving lies in "work and experiment." "The world to-day makes but one demand on every man, no matter who he is—fairness and work." The pulse of the machine in New England mill-town politics is recorded with the fidelity of a watchful specialist—not, however, in bravado, but in the spirit of a helper, appalled at existing conditions political, aching at conditions social, hopeful for growth, sharply aware of bossism, but not without faith in the independence existing as a mustard-seed in the body politic. While the moral is the thing, the story is quite readable enough to convey the tonic.

"Old Dan Tucker," which figures in a political procession in this story, serves in Kentucky's 'Oldfield' before the war as music for a reel. The foreigner must be and hereby is cautioned against calling it our national anthem. 'Oldfield,' for the rest, is a dried rose-leaf story of "Pennyroyal Kentucky," a region that looked down on Blue Grass Kentucky as a parvenu. Thomas Walker, entering the State at the southeast by the Cumberland Gap in 1750, not Daniel Boone coming into the northern part in 1769, was the real Kentucky pioneer. Miss Judy knew all about it because her father was a Virginian, a Revolutionary officer, and *magna pars* of the emigration, and she tells us that "grants of lands in Kentucky given by Virginia to her officers of the Revolution for military services" were made in the "Pennyroyal Region and nowhere else." Oldfield was kept in further touch with romance by the flatboat-route connection with New Orleans in the days of the Gulf pirates. Alvarado, who whisks through the pages on a flying horse, might have been the comrade of Lafitte. Hints of piracy, Oldfield eccentrics, the shifts of well-bred poverty, cast the shadows in this old-fashioned picture of an old-fashioned community — a Cranford done into Kentuckian. If the pot-pourri style is almost excessively perfumed, we must credit the book with one or two wholly original characters. Notably so, in a Kentucky story, is the Judge who is driven wellnigh mad by his entanglement in the Kentucky idea, the hereditary feud, "the tradition of bloody vengeance," "all deeply rooted in a false sense of honor." At times it seems that the world moves.

Historic Highways of America. Volume I., Paths of the Mound-Building Indians and Great Game Animals. Pp. 140. Volume II., Indian Thoroughfares. Pp. 152. By Archer Butler Hulbert. With maps and illustrations. Cleveland: The Arthur H. Clark Company.

These volumes introduce an important work, which will, in sixteen volumes, describe the origin and evolution of the roads and canals of the United States, from the beginning of such highways in game paths, portages, and Indian trails, to their culmination, when, by means of them, the conquest and occupation of the territory east of the Rocky Mountains was completed and the era of the railroad began. The remark is trite enough that the history of highways is the history of civilization, but in our own land has been afforded an unparalleled opportunity to observe at one view the origin and progress of the highways and of the civilization that advanced along them. "The study of any highway for itself alone might prove of indifferent value; but the story of a road which shows clearly the rise, nature, and passing of a nation's need for it is of great importance." "The Exploration, Conquest, and Development of America, based upon its Highways of War, Commerce, and Immigration," is announced to be the theme of this series.

The first volume comprises two monographs. Chronology would require that the second of these in order, "Paths of the Great Game Animals," should be first considered, were it not that our author ignores both the forgotten tracks of the mastodon and the well-known routes and pathways in laying out which deer, moose, and bear determined the courses of many generations of men, savage and civilized. The only game animal recognized in this book is the buffalo, which, it is believed, entered the territory described long after the mound-builders and other early Indians. Buffalo roads, it is related, marked the passes of the Alleghanies and opened the whole Mississippi basin. Although credited with no great intelligence, the buffalo found the paths of least resistance with remarkable accuracy. "A buffalo trail may be depended upon as affording the most feasible route possible through the region it traverses"; a better route than a deer runway, moreover, because the greater weight of the buffalo taught it to avoid soft ground and steep climbs. For example, the Pennsylvania Railroad crosses the mountains by the buffalo road. "It is nothing less than wonderful that the old highway selected by the instinct of the bison should be found in two instances, in a space of twenty miles, immediately above the railway tunnel." Mr. Hulbert fails to note, however, that these mountain passes were travelled by deer for millenniums and by Indians for centuries before the buffalo ever saw them. It may well be that the instinct of the bison taught him nothing more wonderful than that a deer runway or Indian trail was to be followed. In devoting the whole of the essay to but one of "The Great Game Animals," Mr. Hulbert has not only confused the reader by the misnomer, but has missed the interesting opportunity of studying the beginnings of deer paths in an absolutely trackless wilderness.

The first and greater division of the volume describes the Paths of the Mound-Building Indians, for thus Mr. Hulbert does not hesitate to style those early Americans concerning whose supposed civilization and empire so much extravagant nonsense has been written. "It does not appear," he says, "that the mound-building Indians occupied a higher plane than that reached by the Indians as first known by Europeans." Yet it seems impossible to write of these people without romancing a little, and some of the allegations here made concerning "great armies," "the art of road-making," "stone fortresses," "the transportation of immense quantities of earth and stone," "the deterioration of the civilization of the Indian," will not find universal acceptance. However, no one will cavil at the amusingly guarded assertion "that, in some instances at least, the mound-building peoples were largely a [*sic*] rural people." The Indians, no less than ourselves, depended upon agriculture for their food supply, and it is convincingly pointed out that the States and counties where the rural population is settled to-day were precisely the lands most densely populated in the days of the Mound-builders. Our knowledge of the highways of these people is largely conjectural, and all attempts at detail prove "too speculative to be of genuine historical value." Both on *à priori* grounds, and from evidence furnished by the position of the mounds, it seems probable that the Mound-builders' trails followed the identical tracks used by Indians and white men in historic times. "It is to be noticed, with reference to the effigy mounds, that to a person standing on the present highway, the figures are right side up, the feet are toward the road. In the case of birds, either the head or the tail is toward the present

highway." The theory of these ancient paths is very interesting, since it is developed in "the belief that these early people" were the first human occupants of a primeval and fertile territory, and so "opened the first landward passageways of the continent on these watersheds." Mr. Hulbert's conclusions, which may with but slight reservations be accepted, are summarized by him as follows:

"(1.) The mound-building Indians, like the later Indians, were partial to interior locations; some of their greatest forts and most remarkable mounds are found beside our smaller streams.

"(2.) These works are scattered widely over such regions; if there was any communication it must have been on the watersheds, land travel here always having been most expeditious and practicable through all historic times.

"(3.) They were acquainted with some of our most famous mountain passes, showing that they were not ignorant of the law of least resistance; and, to a marked degree, their works are found beside, and in general alignment with, our modern roads—which to a great degree followed the ancient routes of the Indians which so invariably obeyed this law.

"(4.) The comparative study of the mound-building Indians' works proves that the migrations of that race did not follow even the larger streams by which they labored most extensively."

The second volume comes down to recent historic times, treating of the known "Indian Thoroughfares," nearly all of which are recognizable to-day as trails or highways. "A knowledge of the Indian thoroughfares of the United States forms a most valuable key to the pioneer history of any and all portions of it. To a larger degree than has ever been realized, the explorers, conquerors, and settlers of any portion of this country were indebted to the narrow trail of the Indian." The trails described are, however, limited to the crossing of the Alleghanies and the traversing of the Ohio valley. The evolution and history of several important thoroughfares within these limits in their successive stages as Indian paths, military roads, and routes of settlement are examined as well as illustrated by maps. "It is difficult to realize by what a slender thread" the Central West "hung to the fragile republic east of the mountains during the two decades succeeding the Revolutionary War." "The building of the Cumberland Road was, undoubtedly, one of the influences which secured the West to the Union."

In spite of the title-page, volume one has no illustrations but the maps. On page 91, "Hartford County, Massachusetts," should be "Harford County, Maryland," and the settlement mentioned has no evident relation to any mounds. If Mr. Hulbert is sure that in 1796 there was "a regular line of steamer packets from Pittsburgh to Cincinnati," he ought to tell us more about it, and, if convenient, to cite some authorities. The Jesuit writers, as contained in Mr. Thwaites's new edition, are freely and appositely cited in volume second, but a more thorough reading would have prevented such sweeping and fallacious assertions as, "The 'blaze' was a white man's invention, and . . . there is not a shred of testimony or evidence that the red man ever marked out the course of his paths by means of blazed trees." Nor was the trail "always" a single track. Generally speaking, however, we find Mr. Hulbert accurate and reliable. A little more time in preparing this work would have been well spent. There are occasional misspellings, and no doubt the author did not intend to call the Ohio "the La Belle Rivière." More careful proof-reading would have spared him such annoyances, and his style, graphic and effective as it is, would have been improved by a little polishing. His volumes cannot be considered as exhausting their subject, nor even as completely presenting it, nor is any claim made to this effect. They have the faults as well as the great merits of a pioneer work. Mr. Hulbert has blazed a trail, not constructed a turnpike, but his trail is well laid out. All who come after him will owe him thanks.

The Rise of Religious Liberty in America: A History. By Sanford H. Cobb. The Macmillan Co. 1902. Pp. xx, 541.

In this handsomely printed volume the Rev. Mr. Cobb "attempts a systematic narrative—so far as the author is aware, not hitherto published—of that historical development through which the civil law in America came at last, after much struggle, to the decree of entire liberty of conscience and of worship"; a result which he considers the "most striking contribution of America to the science of government."

Mr. Cobb sketches, first of all, the nature of the American principle of religious liberty, showing that it is not toleration and not simply freedom of conscience, and then traces in outline the relations of Church and State in Europe from the beginnings of Christianity to the English Toleration Act, making large use of Innes's 'Church and State.' This part of the work is very superficially done. The author then takes up with much more fulness the story of the several American colonies under the heads "Church of England Establishments" (Virginia and the Carolinas), "Puritan Establishments" (Plymouth, Massachusetts, Connecticut, New Haven, and New Hampshire), "Changing Establishments" (New York, Maryland, New Jersey, and Georgia), "The Free Colonies" (Rhode Island, Pennsylvania, and Delaware). He then glances at the attempts to establish a Colonial episcopate, and traces briefly the period of the Revolution and the final separation of Church and State.

On the whole, it must be said that Mr. Cobb has presented the story in its essential outlines, and in a way which renders his volume of considerable service to the reader. He has grouped together a mass of material bearing on the subject which makes a distinct and, in the main, accurate impression in its total effect. Yet the work is surprisingly marred by errors in matters of detail, due in large measure to very scanty use of the sources, but also due, one must believe, in many instances, to carelessness on the part of the author himself. Thus, to give but a few illustrations out of many, and those only in reference to New England, Mr. Cobb confuses Lechford and Lyford, attributing to the latter the well-known 'Plain Dealing'; he ascribes to Endicott Higginson's farewell words; he quotes a eulogy by Cotton Mather as the expression of a contemporary of Winthrop; he describes the Massachusetts General Court of May 18, 1631, as "the first general court" of that colony, though the paragraph in the Records from which he quotes a portion refers to previous action by "the last General Court"; he speaks of "churches" at Boston in 1646, when there was but one; he dates the "Reforming Synod" 1676; he ascribes the Blue Laws of Samuel Peters to the year 1681; and he repeats the old error regarding the Half-Way Covenant, that its purpose was political rather than religious, and its "ulterior, though unannounced, design" was to increase the number of those eligible to the franchise.

These are but a few specimens out of many which may be met with in the book, which evidently, therefore, is not to be depended upon in detail, and ought to be subject to very thorough revision.

Twelve Types. By G. K. Chesterton. London: Arthur L. Humphreys. 1902.

Mr. Chesterton, in his little volume of 200 pages, deals with Charlotte Brontë, William Morris, Byron, Pope, St. Francis, Rostand, Charles II., Stevenson, Carlyle, Tolstoy, Savonarola, and Scott. This is a pretty wide range, but Mr. Chesterton, like many another young lion of the press, has taken all knowledge for his province. Of his method or system, it is difficult to speak with confidence—indeed, it is doubtful whether any systematic body of opinion underlies what he says. In his essay on Charles II., whom he discusses as a perfect type of the skeptic, he comes nearer to self-revelation than anywhere else; and, after reading it, it is safe to say that he is a liberal of the latest type—and this, we take it, means a kind of opportunism in matters literary and social, analogous to the opportunism which everybody recognizes as the "note" of liberalism in the political world. Mr. Chesterton is one of those writers who make less advanced readers long for an hour of Matthew Arnold. We sigh for "measure"—for that moderation of statement which seems to go naturally with firmly held and consistently reasoned opinions; we are bored by a certain neurotic energy which represents the strenuous in style, and which is so much more objectionable than the iteration of the elder critic. Everything is exaggerated. A skeptic is not—as he certainly was down to Mr. Chesterton's time—a rationalist; this is too moderate a view. We must clench our teeth and squeeze something more out of skepticism than this. A true skeptic believes not even in his own beliefs. He does not know even "whether the tree he is looking at is a tree or a rhinoceros." This is what passes among the strenuous as a hit. In the non-strenuous order, the man who persistently doubts whether a tree is a tree or a rhinoceros, is a lunatic, rather than skeptic.

We do not by any means deny Mr. Chesterton's cleverness. The whole essay on Charles II. is clever, and presents a side of the Restoration neglected by others. So is the essay on "the optimism of Byron," though here the strenuous determination to think out something not said before becomes painful. On the whole, while we cannot class Mr. Chesterton as a decadent—he has in the Byron essay some very good remarks on the decadents—nor as a *poseur*, he is not what it is the fashion to call convincing. When the intellectual

world has finally become, as it constantly tends more and more to become, a hippodrome, his essays will be recognized as very creditable acrobatic performances.

Caterpillars and their Moths. By Ida Mitchell Eliot and Caroline Gray Soule, with illustrations from photographs of living caterpillars and spread moths by Edith Eliot. The Century Co. 1902.

"We have written a true book, and we hope that it may prove a helpful one. If it is not interesting, the fault is with us, not with the subject." This expresses the attitude of the authors, and their book is certainly interesting to all who find any interest whatever in nature. They speak from abundant experience, and with a genuine enthusiasm begotten of love for their insect pets.

Beginning with a description of the "crawlery," as they term their study room, they give in an inventory of its contents a very full enumeration of what is needed by one who desires to watch the transformations of moths from egg to adult—not a list of expensive or complicated apparatus, but such an outfit as any bright boy or girl can procure without much trouble. Then comes a description of the stages through which the insects pass, and how each should be treated: long experience again drawing attention to many little details that would be likely to confuse or discourage the amateur. Diseases and parasites are not forgotten, and the reader is brought to realize that even for caterpillars life is full of trouble and dangers.

Forty-five species, most of them hawk moths, are described more or less fully, and are figured in some or all the stages, and here there is room for criticism. Some of the pictures are really excellent, and some of the caterpillar groups show painstaking effort to obtain natural effects; but the adults or moths which should have been most easily pictured, are genuine disappointments. In the male Cecropia, for instance, what necessity was there for figuring a cripple when perfect examples must have been available? So, *Ceratomia amyntor* represents an undersized, obscure specimen that does not begin to do justice to the species. In the smaller moths, matters are much worse, and there seems to have been no effort whatever to get perfect or strongly characterized examples. Half-tone plates always leave much to be desired in the matter of bringing out fine detail; hence for a work of this kind unusual effort should have been made to secure sharp photographs from well-marked, well-spread insects. In some cases, as in *Ampelophaga myron*, the picture is excellent while the specimens pictured are irregular and poorly mounted.

The book has a place, however, and will be very useful. It is well printed, in large, clear type, on good paper, and has a somewhat ornate cover.

Personal Reminiscences of PRINCE BISMARCK

By SIDNEY WHITMAN.

Author of "Imperial Germany," etc.

With Portraits. Large 12mo. Cloth, gilt top, uncut, $1.60 net. Postage, 16 cents additional.

The author made the acquaintance of Bismarck shortly after he retired from office, and now enjoys the distinction of being the only living Englishman who was in any sense intimate with the great Chancellor. During the last seven years of Bismarck's life Mr. Whitman visited him no less than ten times. He arrived at Bismarck's home for the last visit a few hours after Bismarck's death, and was one of the few persons outside of the family that saw the dead statesman.

As a result of this intimacy, the forthcoming volume contains matter that is exclusive and of historical interest. While Mr. Whitman was living in Germany he met not only Bismarck, but all the great men of the period, and he believes that he is the only Englishman who can make such a claim. The German publisher says this is the most interesting work on Bismarck that has ever appeared, and will issue a large first edition.

A WHALEMAN'S WIFE

By FRANK T. BULLEN.

Author of "The Cruise of the Cachalot," "Deep-Sea Plunderings," etc.

DEDICATED TO THEODORE ROOSEVELT, PRESIDENT OF THE UNITED STATES.

Illustrated. 12mo, Cloth, $1.50.

This is Mr. Bullen's first complete novel. While the romance forming its *motif* is fiction, the scenes are depicted with a vivid realism that stamps them at once as pictures that have come within the author's own observations, and which could not be imagined in all their accuracy of detail by one unequipped by personal knowledge. Life on board a "good" whaler is brought into sharp contrast with the awful conditions prevailing where a ship is commanded by a fiendish captain, as was only too often the case.

The Family of William Penn: *Ancestors and Descendants.* By HOWARD M. JENKINS. A thorough and definitive presentation of the subject, executed with its author's well-known accuracy and thoroughness, mainly from original sources, especially the "Penn Papers." 300 pages. 19 full page steel-plates, photogravures and half-tones, . $3.50

FERRIS & LEACH, Publishers, Nos. 29-31 North Seventh Street, PHILADELPHIA.

THE Forty-third Annual Statement of **The Washington Life Insurance Company** shows a prosperous and healthy state of affairs in every department, notably in the material increase of Assets, of new business and business in force, and of Surplus, and is fitly complemental of the forty-two former annual statements of the company: not in a bewildering array of figures suggestive of unwieldiness and possibilities of loss as well as profit, but in an exhibit of concentrated and compact strength that meets the most exacting requirements, and that will not disappoint the expectations of the insured. In calling attention to the excellent financial standing of **The Washington,** the management also refers with equal satisfaction to its enviable reputation acquired by nearly a half century devoted to the interests of its policy-holders. This record, every page of which attests the integrity governing the administration of its affairs, furnishes conclusive evidence of the soundness of its business methods.

At the close of the business of 1902, as epitomized in this condensed statement, the company had paid in death claims, endowments, and dividends $2,046,708.10. From date of organization to December 31, 1902, the company has paid to policy-holders $39,774,017.82, which latter sum, together with invested funds held exclusively for the protection of its policies, aggregates $56,358,362.37.

Conspicuous among the advantages derived by its policy-holders from the liberal provisions made for their benefit and clearly expressed in its policies, are loan and cash privileges, whereby any danger of loss from inability to pay a premium is effectually obviated.

NEW BOOKS OF IMPORTANCE JUST PUBLISHED BY

THE MACMILLAN COMPANY

SIR WALTER BESANT'S

London in the Eighteenth Century.

A handsome demy quarto volume, gilt, containing 104 Illustrations from contemporary Prints, and a Map.

"Many facts, and even statistics, sprinkle the pages, yet they are so diversified by anecdote, story, and picturesque setting that the book is engrossing and its manner delightful."—*London Times.*

Cloth, 680 pages, $7.50 net (carriage extra)

SIDNEY LEE'S

Victoria: A Biography

With portraits, a fac-simileand a map.

"The most truthful life of a great Queen and the most impartial history of the Victorian age that has yet been issued from the press."

—*The Spectator*, London.

611 pp., cloth, 8vo, $3.00.

ELWOOD MEAD'S

Irrigation Institutions

A practical discussion of the all-important water questions of the West, by the Chief of Irrigation Investigations, Department of Agriculture.

Citizen's Library. Half leather. $1.25 net (postage 9c.).

ERNEST A. GARDNER'S

Ancient Athens

By the former Director of the British School at Athens.

"We may cordially testify to the value and interest of the book as a broad survey of its subject, clear, practical and vivid, and altogether a sound guide."

—*The New York Tribune.*

Cloth 8vo, gilt top, profusely illustrated, $5 net. (Postage, 30c.).

Of interest to all who would direct a child's interest in books.

By CHARLES A. McMURRY, PH.D.

The Method of the Recitation

Cloth, 16 mo. Just ready.

Special Method in the Reading of Complete English Classics

IN THE GRADES OF THE COMMON SCHOOL

New Edition. Revised and Greatly Enlarged. Cloth, 16mo. 75c. net.

Special Method in Primary Reading and Story

Cloth, 16mo. Nearly ready.

The early volumes of a series which aims to secure a simple scientific method of classroom work.

M. OSTROGORSKI'S

Democracy and the Organization of Political Parties

Translated from the French by FREDERICK CLARKE. *Preface by* JAMES BRYCE.

"An invaluable contribution to knowledge of democratic institutions."—ALBION W. SMALL, *American Journal of Sociology.*

"In the fullness, accuracy and painstaking care with which it was prepared it takes rank with Mr. BRYCE'S 'American Commonwealth.'"—*Phila. Press.*

Cloth 8vo, 2 vols., $6.00 net (expressage extra).

The Cambridge Modern History

Vol. I. THE RENAISSANCE

Planned by the late LORD ACTON; *written by nineteen of the most eminent of English historians.*

"There can be no question about the great value of the work—in fact, it is invaluable to every historical student."—*The Public Ledger*, Phila.

Vol. I. Cloth, 8vo. 927 pp. $3.75 net (postage 29c.).

JOHN FISKE'S

Essays: Historical and Literary.

"These two volumes show him from many sides. His vast knowledge, his power of saying things persuasively, the play of his wit, the large catholicity of his mind are on every page . . . they must rank among the biggest books of the year."—*Pittsburg Gazette.*

Cloth, 8vo, 2 vols., $4.00 net (carriage extra).

JOHN GRAHAM BROOKS'

The Social Unrest

STUDIES IN LABOR AND SOCIALIST MOVEMENTS.

"It is the only volume before the American reading public to-day in which the views of both sides to the great social problem are set down in full fairness and candor."—*Chicago Daily News.*

Cloth, 12mo, $1.50 net (postage 13c.).

Happiness

ESSAYS ON THE MEANING OF LIFE

By CARL HILTY, University of Bern. Translated by F. G. PEABODY, Professor of Christian Morals in Harvard University.

Cloth, 16mo. $1.25 net (postage 7c.)

On net books ordered from the publisher carriage is an extra charge; for sale by all dealers at net rates.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 12, 1903.

The Week.

Both houses of Congress have now passed the bill, suggested by Attorney-General Knox, for expediting prosecutions in the United States Courts under the Interstate Commerce Act or the Sherman anti-Trust law. No objection was made or debate had in either Senate or House. There was really no room for any. Whatever else may be said about bills against Trusts, this at least must be agreed to by everybody, that it is of the highest importance to find out what power we have under existing law. Yet for that we were in a fair way to have to wait two years more. It has been clearly understood, for example, that the Northern Securities case could not, in the ordinary course, be so much as heard by the Supreme Court before 1904. Under the bill now passed we shall get a decision very much earlier. That is so plainly and so eminently desirable that even contentious Congressmen could discover no reason for opposing or delaying the Attorney-General's measure.

It will be time enough to discuss seriously the terms of the Littlefield Anti-Trust bill when it is taken seriously by the Senate. At present, the general understanding is that it will not even be reported to that body. This confident expectation accounted, in part, for the passing of the bill, on Saturday, by a unanimous House. Any measure which gets by the Representatives in that way is, presumptively, either a bill for Buncombe or one that is marked for early death in the Senate. As it passed, the Littlefield bill was shorn of some of the features which, in its original form, were most entitled to be called drastic, and it cannot now be regarded as an attempt at revolutionary lawmaking. Even so, however, the Senate will none of it. The anti-Trust programme for the session is not expected to go beyond the bill expediting anti-monopoly cases in the United States courts, the bill forbidding railway rebates, under more severe penalties, and the amendment to the act creating the new Department of Commerce in such a way as to give it a Bureau of Corporations, with a certain power to compel publicity. After this pending legislation is given its final shape, we shall be able to measure accurately the work of Congress in carrying out the President's recommendations against Trusts.

Though the Littlefield bill passed with unanimity, it passed without a particle of enthusiasm. The debate was listless; the voting mechanical; the result cut and dried. Why was this? Partly because the whole thing was an insincere shouldering of a disagreeable subject upon the Senate. Even more, we think, because everybody was conscious that a roundabout and uncertain attack was being made on the evils of monopoly, while a direct and damaging assault, which might have been made, was neglected. Publicity and restraints on interstate commerce are but remote and doubtful remedies, compared with the immediate cutting away of the protective duties which serve as a bulwark to so many forms of monopoly. Yet these a Republican House dares not touch. It was a Republican member, however, Mr. J. B. Perkins of the Rochester district, who a few days before uttered the plainest warnings to his associates. He said:

"The return of the Democratic party to power would be a misfortune, and I should not fear it unless it came by reason of Republican mistakes. If our friends on the other side succeed again, it will not be as the result of Democratic wisdom, but of Republican folly. The people are paying more for coal than they like to, and they find a duty on it that we will not repeal. The duty on hides and lumber injures important interests, and we keep it in force. That is not the way to get votes. We are kept in because people are afraid of what the Democrats will do, but we cannot count on this for ever. If we do not change some things in our tariff system, sooner or later others will be elected who will do it for us."

The Senate debate on the Statehood bill on Thursday brought out the very interesting, but not wholly unfamiliar, fact that the Mormon Church in Utah controls absolutely the political activities and destinies of its members; no Mormon runs for a high office "without the consent of the first presidency," said Mr. Dubois. Mr. Hale expressed a fitting horror at the exposure, asserting that the Mormon Church exercised "the power to bind and to loose" in a manner contrary to the spirit of American institutions. In this indignation we share unreservedly, but we wish more of it. We wish to see Senator Hale or Senator Dubois take up the maleficent effect of such a religious institution as Platt's Sunday-school. Does any one suppose that a prominent Republican in the States of New York and Pennsylvania, for example, is less dependent upon the machine than a Mormon candidate for office upon his church? Does anybody suppose that the power of a boss "to bind and to loose" is smaller than that of the Mormon First President? Why should anybody who has the future of American institutions at heart assert that the power of Brigham Young's successors is un-American, but omit to say that the preponderance of Platt and Quay is equally un-American? Is it expedient, gentlemen of the Senate, to show too great zeal in the search for Mormon motes while your honorable body is cumbered with such Gentile beams as a Platt and a Quay, and while an Addicks is forcing your doors?

The Aldrich bill to extend the facilities for Government deposits in the national banks, introduced on Monday in the Senate, is an outcome, partly of the discussion which followed Secretary Shaw's action last September, but, more immediately, of the Chamber of Commerce resolutions of last December. Under existing statutes, receipts from internal revenue may, as they are collected, be deposited with the national banks; such deposits drawing no interest, but being secured by a first lien on the assets of the bank, and by pledge of United States Government bonds, to an equivalent face value, in the hands of the Treasury. Secretary Shaw extended the list of acceptable collateral to certain State and municipal securities; but the legal authority for this move was seriously in doubt, and the Treasury has already substantially receded from its position. The Aldrich bill creates the authority which was lacking last September, and in other ways enlarges the Treasury's power to keep its surplus in the money market. Briefly summed up, the bill provides that the Secretary may deposit in bank public moneys received, not merely from internal revenue, but from all sources; that he shall exact from the depositories an interest rate of at least 1½ per cent., and that he may accept as collateral, not only Government bonds, but State and municipal bonds of a prescribed standing, and first-mortgage bonds of railways whose stock has regularly paid 4 per cent. for the ten preceding years. These provisions, in connection with the Government's first lien on the assets of failed banks, constitute an ample safeguard, and would place the public deposit matter as nearly in a rational position as it can occupy under the present Sub-Treasury system. This measure goes a little further than the recommendations of the Chamber of Commerce, but not so far as those of Secretary Shaw in his recent annual report. It undertakes to correct a situation which was always absurd and was fast growing intolerable.

The announcement that the President will veto any bills restoring to the army dismissed officers, and then putting them on the retired list, is very gratifying. This process not only amounts to the granting of a pardon and a very liberal pension, but also gives the beneficiary the right to wear the uniform which he once disgraced. If the applicant has not

overcome the fault which led to his downfall, he certainly is not entitled to restoration. If, on the other hand, he has become an industrious member of society, he is certainly not in need of Government bounty. This abuse of the retired list has been very frequent in past years, despite the protests of army officers who have rightly insisted that the retired list should be kept as a roll of honor for deserving veterans. It is bad enough, they say, that men like "Hell-Roaring" Jake Smith and Eagan of "embalmed beef" fame should be put upon it by way of punishment for their misdeeds. The retired list was never intended to be a refuge for the offenders of the army. The service will therefore be delighted with the President's policy, which is also that of the War Department. It would be well if Mr. Roosevelt could take an equally severe attitude towards private pension bills, which are generally in the interest of persons wholly unworthy of Government aid.

It is impossible to believe that the country will accept as conclusive either of the reports prepared by members of the House Naval Committee on the submarine-boat bribery charges. The committee itself is hopelessly divided. According to the dispatches, the "battleship-trust" members insist on vindication for Lessler as well as for everybody else except Doblin, while the "Holland boat crowd" is for a report declaring that Lessler's charges are not sustained. The "Holland boat crowd," it is intimated, is angry with Lessler because the scandal following his disclosures has defeated an appropriation, at this session, for submarine vessels. The country cares very little about the resentment of submarine-boat advocates or the gratitude of those who favor battleships. What it does demand, however, is a thorough probing of the naval-bill scandal, and it is perfectly evident that nothing of the sort has yet been accomplished, or even attempted.

The House Committee on Naval Affairs, after passing over the Doblin case so hurriedly and leniently, voted in favor of a large addition to the navy. The Holland Company failed to get any further orders, but the Committee decided upon three more battleships, one first-class cruiser, and two steel training ships and one wooden one. It also accepted the proposal to double the number of cadets at Annapolis, and to add sixty-five officers and eight hundred men to the Marine Corps. This is undoubtedly a larger programme than would have been agreed upon had there been no Venezuelan imbroglio, which, by the advocates of a large navy, has been skilfully used to inflame popular passion and play upon a misguided patriotism. If there is one lesson to be learned from the Venezuelan complications it is how quickly and heavily a nation may pay for having a bumptious navy and trying its guns on its debtors. Germany's little bill for this magnificent triumph includes not only the actual expenses, and loss of business with North and South America, but, above all, the feeling of uneasiness and dislike which her methods have aroused among the American people. In our estimation, every ship Congress now adds to our navy is a menace to our peace and a step backward from the enlightened and Christian position which this unarmed nation occupied for a century.

A year or so ago the pesky Anti-Imperialists were the ones who were keeping up the war in the Philippines by their refusal to approve of our policy in the archipelago. This, as we all remember, was the blackest treason. But what shall be said of a Congress which is deliberately inciting the Filipinos to revolt by its refusal to take any steps to relieve the terrible suffering reported by our own officials? Nothing else can be got out of Gov. Taft's fresh appeal for aid which was given out in Washington on Monday. "Failure to furnish relief at this session of Congress," he says, "would create consternation throughout the islands. . . . The political situation would become *more difficult*." Could the Governor of unhappy and unwilling subjects use plainer language? He reports a total net loss to the insular treasury from the depreciation of silver of $1,277,941—enough to keep many a starving Filipino alive. Among other misfortunes, Mr. Taft reports "immense losses to merchants who have sold on credit," and the continuance of destitution due to the plague, cholera, and rinderpest. Surely this is a tale to move the heart of any humane man.

Secretary Root's speech in this city is another proof of the way the negro problem is coming to the forefront of our national issues—"parochial" as it is. It was easy for him to show that President Roosevelt has made fewer appointments of negroes to office than did his predecessors, and he might have added that they are far better appointments so far as character goes. But even this will not mollify the South, for, as Mr. Root pointed out, the trouble lies in a change of sentiment among the Southern people, and not in the White House. This change of feeling towards the blacks, if not coincident with the Spanish war, was undoubtedly greatly enhanced by it and by all the loose talk of an outgrown Constitution and of outlived doctrines of the equality of man. We cannot agree with Mr. Root that negro suffrage is a failure. In that aspect his speech will be productive of harm, especially as it follows similar utterances of two Southern Governors. This republic rests upon the foundation of political equality, and it has yet to be shown that it can endure with millions of its male citizens disfranchised solely because of the color of their skins. No suffrage can be a failure which has not nad a fair trial.

N. G. Gonzales, the assassinated Columbia editor, having waged relentless warfare in his paper against lawlessness, his admirers in South Carolina now wish to erect a monument to him as a champion of law and order, to express thereby their "silent but lasting protest against the lawlessness in our State." It is a kindly movement, but it would avail little or nothing as a protest. Just now a properly adorned gallows would be the fittest monument in South Carolina to the cause of law and order. Any other monument to that cause, or to Mr. Gonzales as its champion, might well await the law's disposition of the case of his cowardly assassin.

The referendum in Vermont has resulted in a small but sufficient majority for local option and high license. Fifty years of statutory prohibition had so ingrained conventional phrases and ideas about saloon regulation into the average Vermonter, that a victory for home rule and common sense seemed unattainable. Ever since the Legislature passed the act now returned from the people as law, the churches and the press have been vocal with appeals against the compromise with sin and for the protection of the home. It required courage on the part of those who voted "yes" to stand out against this fine but ill-judged enthusiasm, and vote steadily, not for an impracticable law, but for one that can be enforced. The State of Vermont is to be congratulated upon clearing its mind of cant, and coming under a law which lets each community deal with the liquor traffic according to its needs. The result will probably be that the villages will remain "dry," with a quickened public opinion to keep them really dry; and the larger towns "wet." This will mean that the small dives will tend to disappear, and that innkeepers will sell to all comers (paying the community handsomely for the privilege) without the accessories of locked doors, dark passages, and private signals. All this is in the direction of sincerity.

Just what weight in law or morals should be given "preferential claims" against Venezuela, such as the allies now urge, is a question of the very kind to be submitted to the Hague Tribunal. On the one hand, a rude sense of justice would seem to favor the notion that those who have been at great pains and expense to collect their debts, should

have a priority over those who have simply sat by and waited a general settlement. But, after all, Germany and England did not actually collect their dues. They did not drive the thing home. If they had seized Venezuelan custom houses, or landed a force and captured Caracas, no one could have disputed their right to settle their own claims first. But this ultimate assertion of *force majeure* they stopped short of; and it is a nice point whether, in the circumstances, an already adjusted claim, like that of France, should be made to wait upon the liquidation of dues of which the collection is sought by a kind of aborted violence. The tribunal of The Hague is the precise place to have such a dispute heard and determined; and the decision to refer it there is a happy way out. With all other points adjusted, and the blockade speedily to be raised, the solution of what threatened to be a serious controversy seems now to be fully in hand That the situation has been handled with great skill and marked restraint and good judgment by the President and Secretary Hay, everybody must concede. As for Minister Bowen, if he has erred at any point from excess of zeal, it must be remembered that he had a most anomalous task, in which it seemed impossible that he should win anything like the success he has scored.

It is clear that the controversy over Minister Bowen's diplomatic manners arises, in good part, from his dual rôle. He is Minister of the United States and, at the same time, plenipotentiary of President Castro. Yet it is purely in the latter capacity that he figures in the Washington negotiation. The trouble is, however, that the representatives of the allies seem to be always thinking of him as American Minister. If he stands up stiffly for his principal in Caracas, as he is bound to do, they at once begin to ask why an agent of the United States should hold such positive language with them. Let them remember that he is, for the nonce, solely the spokesman of Castro. As such they might find for him the historic excuse offered to Frederick the Great. That monarch, to show his spite against the English Government, had sent as envoy to London a notoriously dissolute man, and one day maliciously asked the British Minister in Berlin what the English thought of the Prussian *roué* he had given them. With great presence of mind, Minister Elliott bowed low and said, "Digne représentant de votre Majesté!"

The *Financial Chronicle* publishes the annual estimates of the world's production of gold and silver for the year 1902. That of gold foots up $304,589,862, against $266,559,884 the previous year, The highest yield of any year (that of 1899) was $314,630,233. The remarkable fact is that the world's production is now within $10,000,000 of what it was when the South African yield was at its maximum. In 1899 the output of the latter was $73,227,100. In 1902 it was only $40,000,000. When the Transvaal mines are turning out their usual quantity, the total annual product will probably be $25,000,000 larger than that of last year, unless there should be a falling off in other countries. There has been some decline in Canada, whose production for 1902 was only $19,500,000, against $24,400,000 in 1901 and $27,900,000 in 1900. On the other hand, the output of Australia has increased about $7,000,000, and that of the United States about $2,200,000, as compared with 1901. More remarkable than the world's production of gold, however, is that of silver, which has shown a steady increase in the face of declining prices. The outturn of the year 1891 and of the past four years was as follows:

Year.	Ounces.	Value.
1891	137,965,412	$124,474,000
1899	167,224,243	93,128,460
1900	172,838,873	98,871,840
1901	174,998,573	98,344,640
1902	178,866,084	87,421,880

The significant fact is that the largest production of silver the world has ever known in a single year (1902) took place when the metal was selling at the lowest price ever known.

The story of an injured agent for Gen. Grosvenor's 'Book of the Presidents' published on Friday in the *Evening Post*, explains fully an affair for a time obscured by the evasions and prevarications of the Congressman-author. In brief, this subscription work, whatever may have been Gen. Grosvenor's written contract, was in the nature of a "benefit" for him, and a speculation for his manager, Elder. The suggestion that the author had no pecuniary interest, beyond his contract, in a book subscriptions to which varied from $100 to $1,000 a copy, may be promptly dismissed. It appears also that the letters soliciting subscriptions and bearing a forgery of Gen. Grosvenor's signature, were written, apparently with his consent, on Congressional paper furnished by him. A personal letter from him, written significantly on the paper of the Merchant, Marine, and Fisheries Committee, was addressed to a prominent financier. The evidence is clear that Gen. Grosvenor has traded upon his official position for his private profit. He has associated himself with a begging enterprise conducted by a man formerly convicted of fraudulent use of the United States mails; finally, he has turned and twisted and lied as his literary schemes have been revealed. A very rudimentary sense of honor would compel his resignation from the House of Representatives.

The petition of seventy heads of preparatory schools should do something to shake the Intercollegiate Football Rules Committee out of its present lethargy. These teachers, representing many prominent schools and enjoying unusual facilities for studying the effect of football playing upon their pupils, assert that "the game as at present played is too severe and too dangerous," and express their belief "that it is possible, by modification of the rules, to develop a style of football that will retain the unique and characteristic advantages of the present game without its most serious attendant evils." It is strange, on the face of it, that these schoolteachers, many of whom are themselves old players, should see clearly their way to reform of football, while the old players who make up the Rules Committee either despair of a remedy or acknowledge no need of reform. In the interest of one of our finest sports, were it only properly restricted and made reasonably unhazardous, these legislators, if they lack ideas of their own, should consult with those who have ideas. They cannot afford to drift until the schools and colleges begin to consider the suppression of the game.

While the news from the near East is of a distinctly serious cast, it should not be forgotten that considerable deductions must be made from all stories of outrage and massacre. There is no adequate news service in Macedonia and Albania. The English correspondents at the coast towns or even at Vienna send on whatever tidings reach them from the interior and seem credible. Everything is hearsay and frequently at second or third hand. It may be that the conditions are infinitely worse than anything we ever learn of here; it may be, on the contrary, that the chronic small disturbances in northern Turkey come to us magnified threefold. The situation cries for a Schuyler or a MacGahan to report on the facts, and it is encouraging to learn that the London *Daily News*, remembering its honorable achievement before the Turko-Russian war, is planning to get news direct from the scene of the disorder. This to many will seem a striking repetition of the history of twenty-five years ago. But it by no means follows that the parallel will be carried out consistently. In fact, the chief ground for apprehension in the Balkans is that Russia is to-day quite free from the various checks, notably Disraeli's doctrine of Ottoman "integrity," that hampered her before and during the last war. But this freedom of Russia is also a kind of guarantee that no necessary intervention on her part in the Balkans would be likely to serve as the signal for a general European war. The whole outlook to-day is far less perplexing and perilous than it was in 1876-7.

THE LATEST SILVER PROJECT.

Seeing that only about twenty days remain of the present session, there has been a marked indifference on the part of the Republican members of Congress to the President's request for an international silver conference. What the President asked was "that the Executive be given sufficient powers to lend the support of the United States, in such manner and to such degree as he may deem expedient, to the purposes of the two Governments"—Mexico and China. It has remained for a Democratic Senator from Colorado, after an awkward pause, to take the first step toward carrying the President's wishes into effect. Senator Patterson has moved an amendment to the pending Philippine Currency Bill, in which he proposes that the President be authorized to invite such governments as he may deem proper to join us in a conference to devise and suggest "a plan for adoption by the several governments, by which a fixed commercial exchange relation shall be established and maintained between the silver coin of the silver-standard countries and the gold coin of the gold-standard countries."

In its aims, Senator Patterson's proposal is identical with the declared objects of the Paris monetary conferences of 1878 and 1881. Its scope is not limited, so far as the United States is concerned, to the Philippine Islands. The conference might embrace the whole country in its recommendations if it should so decide. The Brussels conference of 1892 essayed the more modest rôle of "considering what measures, if any, can be taken to increase the use of silver in the currency systems of nations." The latter is presumably the aim of President Roosevelt now. If so, Mr. Patterson has "cut under" him by offering something which the silver producers are more eager to obtain. They want to sell silver to the United States mint, not merely to that of the Philippine Islands. Of course, a Democratic Senator from Colorado could not see a Republican President carrying off his votes without making an effort to hold them. In the recent contest in that State Senator Teller kept his seat by only one majority. Patterson might easily fail at the next election if there were a fresh schism among the silver men. We do not suppose that President Roosevelt had any political aims when he sent in his silver message, but Senator Patterson could not fail to look at its effect upon the Rocky Mountain States.

If any action is to be taken to carry out the new silver project, its advocates should be required to put their ideas into the form of a bill ready for enactment, or of a treaty ready for ratification. It is related of President Lincoln that when Senator Wade, Chairman of the Committee on the Conduct of the War, was urging him for the fortieth time to supersede Gen. McClellan, he asked Wade whom he would choose for the place. "Oh, anybody," said Wade. "Yes," replied Lincoln, "*anybody* will do for you, but I must have *somebody*." Any vague plan for making and keeping silver coins and gold coins equal in value to each other may serve for the envoys of Mexico and China, and eke for President Roosevelt and Senator Patterson, but practical statesmen may fairly insist upon some particular plan. They should decline to set up a new international conference without first seeing the aims of its advocates expressed in the form of an act, or contract, or definite undertaking of some sort. In none of the monetary conferences of the past were the believers in bimetallism willing to put their aims in definite shape, although they were often asked to do so. They always confined themselves to generalities. They were always seeking to get a vote in favor of bimetallism in the abstract, without reference to the means of putting it in successful operation. "Are you in favor of it if it can be done?" they asked, in the conference of 1876; to which Mr. Goschen replied that it was not worth while to give a categorical answer to a question thus hypothetically put.

In the present case the vagueness of the means of procedure is more puzzling than it was in the conferences of bygone days, since the present promoters say that they are not aiming at bimetallism. The gold standard countries are to use gold, and the silver standard countries are to use silver. It is only asked that somebody shall tie the white coins and the yellow ones together with so stout a cord and so tight a knot that they cannot fly apart, however much or frequently the white metal and the yellow one may vary in value. This may be done in a single country, and for itself alone, by limiting the coinage of silver to the needs of retail trade. It cannot be done by concert of action among different countries, and it is not desirable to try, since it ties the hands of all concerned, and deprives them of liberty of action in one of their most vital interests.

In the three weeks remaining of the present session of Congress, no new measure can pass that gives rise to extended debate. Yet it is quite certain that a bill for a new monetary conference would meet formidable opposition, and must run the gauntlet of numerous amendments. It is not certain that any Philippine Currency Bill will be passed, although the need of one establishing the gold standard is very great. To postpone that measure until we can have a "big talk" with Great Britain, France, Mexico, and China, on a theme which even Ah Sin cannot understand, is to keep the Filipinos, for an indefinite time to come, subjected to the miseries of an unstable currency, which are only less intolerable than those of the devastating rinderpest.

ADMITTING NEW STATES.

The long Statehood deadlock in the Senate has seemed in a fair way to be broken by a compromise. This is in line with historical precedent, and, moreover, it must be admitted that there are some distinct advantages in the form of agreement proposed. The Statehood bill, as it passed the House, provided for the admission of three States, Arizona, New Mexico, and Oklahoma, with a provisional arrangement whereby the Indian Territory might later become a part of Oklahoma. The debate in the House was of a perfunctory sort, and when the measure reached the Senate at the close of the first session of the present Congress, a sub-committee of the Committee on Territories was instructed to investigate on the spot the resources and conditions of the regions in question. The inquiry was made during the recess, and the results have been presented to the Senate in a report and in exhaustive addresses by the members of the sub-committee. Briefly stated, the conclusion obviously to be drawn from the data submitted by the sub-committee would be that neither Arizona nor New Mexico is fit for Statehood, while Oklahoma, especially with the Indian Territory added, fulfils all the requirements properly demanded of a new State.

Arizona, after forty years as an organized Territory, has a population of but 122,000, including Indians, of whom there are about 22,000. Her lands are arid, and, except by means of irrigation, are unfit for agriculture. Her resources are almost wholly mineral, and experience has shown that these do not conduce to permanency of population. Nevada, for example, whose resources are also almost wholly mineral, had a population in 1880 of more than 62,000, but this in 1900 had receded to 42,000. Most of these unfavorable conditions are duplicated in New Mexico. This Territory has a larger population, amounting to about 195,000, and so comes just within the rule which has been supposed to apply in recent years—that a candidate for Statehood must have a population as great as the unit for representation in the lower house of Congress, at present 194,000. New Mexico's resources are also chiefly mineral, though her farm products in 1900 were worth $10,155,000, about one-third the value of the farm products of Vermont for the same year. The population of New Mexico, moreover, was found to contain undesirable elements. Estimates of the Mexican or Spanish-speaking portion of the population vary from two-fifths to 60 per cent. of the whole. Thirty-three per cent. of the entire 195,000 are unable to read or write in any language. Interpreters are constantly employed in the courts, testi-

mony being given in either language, and the juries being generally part Mexican and part American.

Undoubtedly, the case against admission of either of these Territories is exceedingly strong. The argument in favor of Oklahoma and the Indian Territory, on the other hand, is undeniably valid. Oklahoma had in 1900 a population of 398,000 and the Indian Territory of 392,000. Only 52,000 of the latter were Indians. The agricultural lands are abundant. The population which poured into Oklahoma when it was opened thirteen years ago was Anglo-Saxon. There is now taxable property in the Territory assessed at more than $72,000,000. In wealth and population the yearly increases are enormous. Reports of county assessors place the present population at 540,000, an increase of nearly 150,000 since the census of 1900. The value of Oklahoma's farm products in 1900 was $45,447,000, and of the Indian Territory $27,672,000. It appears that it would be an injustice to refuse Statehood to these two Territories. Yet failure to take some action in regard to Arizona and New Mexico at this time doubtless involves failure to admit Oklahoma and the Indian Territory.

Treaty obligations are also involved in the problem. The ninth article of the treaty with Mexico, entered into at the close of the Mexican war, when most of the Territory in question was acquired by the United States, was as follows:

"Article 9. The Mexicans who, in the territories aforesaid, shall not preserve the character of citizens of the Mexican republic, conformably with what is stipulated in the preceding article, shall be incorporated into the Union of the United States, and be admitted at the proper time (to be judged of by the Congress of the United States) to the enjoyment of all the rights of citizens of the United States, 'according to the principles of the Constitution.'"

An attempt has been made to argue, from this and other similar treaty provisions, that there is some immediate obligation resting on Congress to admit these new States. No such obligation exists, but it is clear that ultimate admission is required. The question is, shall Oklahoma and the Indian Territory, which are ready for Statehood, be denied admission in order to postpone for a term of years the admission of two Territories which must come in sooner or later, and which might come in now as a single State, thus reducing by half their representation in the Senate? Perhaps the opportunity to admit them as a single State will not present itself again, yet the advantages of so doing are obvious. Not only would the representation in the Senate of undesirable territory be thus reduced to a minimum, but also the merger would conform to the rule for the admission of large States west of the Mississippi—a rule which when violated has been broken to the disadvantage of the Union. The combined area of the new State would be 235,000 square miles, considerably less than the area of Texas.

THE GENERAL STAFF.

The War Department's bill for the establishment of a General Staff has now passed both houses of Congress, and is therefore certain to become a law within a few days. In many respects this is the greatest achievement of Secretary Root's Cabinet career. It is a very brief bill, comprising only about fifty lines of large type. It involves no extra expenditure of Government funds, and adds not a single new officer to the existing military establishment. Yet it calls for the most radical departure in American military theory since the formation of the Government. If properly carried out, it means the modernization of an army which stood still from the end of the civil war until the Secretaryship of Elihu Root, content to let the military art make progress everywhere else, but not within its own ranks.

Primarily, the General Staff is a simple business provision. It makes possible in army administration the foresight and preparation for the future to be found in every successful business house. As is now recognized even in Congress, the War Department plunged into the war with Spain totally unprepared for its duties. It had neither maps nor plans of campaign, nor accurate information about its own country, much less the enemy's. It did not know whether there were any transports to be had, where they were to be found, or what they would cost. It chose rendezvous for army corps, and learned afterwards that the harbors selected were too shallow for transports. It placed an entire army at the mercy of a single-track railroad. It purchased, and made its plans to purchase, uniforms, food, material of war, underclothing, etc., etc., after the declaration of war. It was cheated and robbed, and men died by scores and hundreds, of neglect and carelessness, in the terrible confusion and chaos which followed.

It is sufficient description of the General Staff to say that if it had existed, and existed efficiently, untainted by politics, in April, 1898, few if any of these shortcomings would have been noted. From now on, the officers detailed to it are to be a bureau of information and a group of military business men planning for the future. Chiefs of staff bureaus are no longer to work earnestly and untiringly, each along his own lines, in utter ignorance of the efforts of the others. The three generals, four colonels, six lieutenant-colonels, twelve majors, and twenty captains or lieutenants to compose the General Staff, are to form a military clearing house, in order that all the staff departments shall work harmoniously and intelligently to the common end. They are to be the directing brain of the army, and, while directing, are to acquire a schooling nowhere else obtainable, in order to fit them for high commands in the field. They are to be the *corps d'élite* of the service, and will furnish a goal for the legitimate ambition of every worthy officer. These officers are to serve four years with the General Staff, and then at least two years with their respective branches of the service before again being eligible.

Exactly how efficient this body will become will depend upon the War Department. As Gen. W. H. Carter has well expressed it, "Any system which allows the officers of a General Staff to degenerate solely into bureau officers will cause them to forfeit the respect of the line of the army; above all else, the personnel of a General Staff corps should be selected with reference to ability, and without any suspicion of favoritism." If these principles are adhered to, the army will, for the first time in its history, have an effective stimulus to professional study and achievement in time of peace. In connection with the War College and the professional schools, it should insure a body of officers so well trained as to be worthy of comparison with those of foreign services. It is only regrettable that Congress did not compose the General Staff of extra officers at slight additional cost. The detachment of so many officers from their regiments will injure the efficiency of these organizations.

An equally radical departure in the bill is the provision abolishing, after the retirement of Gen. Miles in August next, the position of commanding general and substituting therefor a "chief of staff." Friction between the military head and the civilian head of the army has existed from the very first. Every commanding general has encountered obstacles which have finally reduced the position as held by Gen. Miles to one of innocuous dignity—and to nothing else. The chief of staff will stand between the Secretary of War and the army at large. If he does not happen to be the Lieutenant-General, the latter will still have an honorable command assigned to him. The chief of staff, the bill says, "shall have supervision of all troops of the line and of the Adjutant-General's, Inspector-General's, Judge-Advocate's, Quartermaster's, Subsistence, Medical, Pay, and Ordnance Departments, the Corps of Engineers, and the Signal Corps, and shall perform such other military duties, not otherwise assigned by law, as may be assigned to him by the President." He is to be latter's executive along purely military lines. Like every other officer of the General Staff, the chief is to be detailed for four years, "unless sooner relieved." This provision insures a President's obtaining a loyal chief in harmony with his views, and should make impossible the present scandalous relations between the military head and his civilian superiors. In this respect, too, the bill is epoch-making.

TRUST COMPANIES AND THE CLEARING HOUSE.

The New York Clearing House is composed of sixty-two banks, which meet on every business day to exchange the checks and drafts they hold against each other, and to pay or receive the cash balances arising thereunder. There are also eighty financial institutions which use the facilities of the Clearing House through banks that are members of it. Thus a non-member makes an arrangement with a member to receive all checks drawn upon it, and pay them at the Clearing House in the same way as its own. When such an arrangement is made, the banks send to the Clearing House for settlement the checks drawn on the non-member which they have received in the course of business the previous day. Checks drawn on a non-member which has no such clearing facilities must be collected at the non-member's counter. The trust companies usually deposit the bulk of their money in banks, on which they draw checks (except for very small sums) to pay the checks drawn by their depositors upon themselves. Hence, in the case of a non-clearing trust company, there is one day intervening between the receipt of such checks and the collection of them in cash, and a consequent loss of interest. But the banks make no discrimination between trust companies which have clearing facilities and those which have not. They receive as deposits, without discount, all checks drawn on non-members. Some of the oldest and largest trust companies in the city have no clearing facilities, and do not desire any.

Trust companies have been multiplying rapidly of late. The common saying is that "it is a cold day when a new one is not formed in New York." Although, in the eye of the law, they are all alike, and in the eye of the public they are doing the same kind of business, there are wide differences between them in practice. Some of them, but these are now the small minority, do a strictly trust business. They take only such deposits as are payable at a fixed time. They do not pay checks on demand. They do not compete with the regular banks. These are the old-fashioned companies, but even these are yielding more and more to the pressure and fashion of modern business by receiving deposits payable on demand, buying commercial paper and making advances on securities; in other words, doing a regular banking business. Thus their competition with the banks is becoming more and more a serious matter, especially since they are not required by law to keep any fixed percentage of cash reserve.

National banks, however, are required to keep 25 per cent. of their deposits in legal-tender funds, and State banks (in New York city) 15 per cent. Thus the trust companies are enabled to lend, say, 95 per cent., or even more, of their deposits, while the national banks cannot lend above 75 per cent. of theirs. The former have an advantage of perhaps 20 per cent. in their lending ability. The regular bankers consider this an unfair advantage, and they seek to redress the balance by requiring the trust companies to keep a larger reserve in their own vaults than they have been accustomed to heretofore. Accordingly, a resolution was reported by the Clearing House Committee on Wednesday of last week, to require all trust companies which exercise clearing facilities to keep, in their own vaults, a fixed percentage of reserve, to wit: 5 per cent. of deposits after June 1, 1903; 7½ per cent. after February 1, 1904; and 10 to 15 per cent. (as may be determined by the Clearing House Committee) after June 1, 1904.

This looks like a very simple proposition, but it is really a very complicated one. In the first place, it applies only to the trust companies which use the facilities of the Clearing House. There are twenty-seven such companies in Greater New York. There are twenty-two which have no connection with the Clearing House, direct or indirect. The latter have about two-fifths of the capital held by trust companies in the city. If the proposed resolution is adopted by the Clearing House, a new disparity will be introduced. The non-clearing companies will have the same kind of advantage over the clearing members that they all have over the banks. The non-clearing members might, however, think it best to make common cause with their fellows against the banks and form a Clearing House of their own. This plan is already talked of. But there are other possible consequences. The trust companies keep their money on deposit in the Clearing House banks. These deposits are worth having. Ordinary trust company deposits in the State of New York amount to $744,000,000, besides $120,000,000 classed as trust or time deposits. No bank will willingly put itself out of reach of such a golden stream. The trust companies have still another weapon if they care to use it. They can retaliate by collecting checks and drafts on country banks without discount, as was formerly the practice of the Clearing House banks. At least one of the new trust companies is now doing so.

What the Clearing House banks hope to accomplish is to secure the passage of the bill now pending in the New York Legislature requiring the trust companies to keep the same percentage of reserve as the State banks do. This, too, looks like a very simple proposition, and is in accord with American practice and habits of thought. Yet it is also subject to complications. There is no reason for keeping a fixed reserve for time deposits. The reason for any reserve whatever is to meet calls for money payable on demand. It would be proper, therefore, to eliminate time deposits from the legal reserve requirement. But such a proposition is beset with the practical difficulty of distinguishing between time deposits and other deposits in any case where the institution is not perfectly fair in its construction of the law. What should be the limit of a time deposit, and what should be the evidence of the existence of a time deposit? Trust companies are multiplying in the adjoining States and all the States. It is hardly possible to pass a law at Albany which will not have the effect either to draw trust funds to this State, or to send them to a more hospitable climate.

We have sought in this article merely to point out the difficulties of the problem, not to decide between different interests and different authorities. We observe in conclusion, that America is the only country, so far as we know, where the law attempts to prescribe what cash reserve any financial institution shall keep to protect depositors.

"TAINTED" GIFTS.

Should the gifts of bad men be refused by the authorities of colleges and similar institutions? This question has been interestingly debated, in the *Outlook* and *Independent*, by Professor Bascom of Williams, President Pritchett of the Boston Institute of Technology, and by the editors of these periodicals. The immediate occasion of the discussion was a remark made at Philadelphia by the English economist, John A. Hobson. He said:

> "The fact that they [millionaires] give us great gifts should not keep us from tracing the origins of their wealth. . . . Is it safe to take money so gained [*i. e.*, by unrighteous methods] and spend it for public purposes at the wish of the millionaire?"

Professor Bascom has taken throughout the most radical ground. He believes that to receive wealth which the recipient knows to be ill-gotten makes him an accomplice of the evil of its acquisition. He points out, also, that even unconditional gifts do insidiously affect the policy of the universities which have received them, and he maintains that the college which receives gifts presumptively tainted—and here he does not hesitate to name Mr. John D. Rockefeller—owes to itself and the public, while it accepts his money, an absolute condemnation of the unrighteous donor and all his works.

This thesis Professor Bascom defends with such eloquence and so fine an indignation that we differ from his opinion with great reluctance. But it will be seen that his theory that there is a large class of wealthy men who are to be abhorred, *dona ferentes*, would, if accepted, lead to widespread confusion. If a college should refuse to accept their surplus wealth, an honest man should decline to buy their products, a Christian should scorn to receive their pay,

a conscientious investor should see that no securities tainted by their management ever enter his strong box. In fine, no taint attaches to the beneficence of a wealthy ill-doer which does not infect all his other activities. The college president who accepts an endowment from him is technically no more *particeps criminis* than the clerk who draws his pay from him.

But, actually, the college president has the added responsibility that comes with greater influence. He is unquestionably bound to reject a gift for any reason incompatible with the ideals of the institution under his charge. That he is under any obligations "to trace to its origins" the wealth which supplies the gift, we do not believe. A college president cannot exercise detective functions nor establish a cure of souls. He is, on the contrary, bound to receive all gifts which do not make himself and his college sponsor for wrongdoing. For the taint is always in the giver, not in the gift. Gifts are, generally speaking, desirable, but certain givers are intolerable. President Pritchett, in the *Outlook*, puts the matter concretely:

"Suppose that William M. Tweed, in the heyday of his career, had come to the authorities of Columbia, and said: 'Here is a million dollars to found a school of political science which is to bear my name.' Columbia could not have accepted that gift and maintained its moral leadership."

Notorious and unrepentant ill-doing, then, seems to be the true criterion. We presume that no university president today would accept an Addicks, Croker, Platt, or Quay foundation in political science, or after their death allow a chair to bear the name of any of them. Here acceptance would be compounding with political corruption.

The case would be more difficult if Devery should come secretly, barefooted and in his shirt, to the head of a theological school, and, after explaining that it was impossible to restore his wealth to the proper owners, should offer, in all penitence and unconditionally, an endowment in Christian morals. Again, the case would be by no means clear if Mr. Croker should live to ninety and outgrow his notorious connection with corrupt sources of revenue. A high-minded president would still be obliged to refuse to attach the name of Croker in any fashion to his college, while he might well be willing to let Mr. Croker's money lie anonymously in the college chest. And assuredly no one would refuse a gift made in good faith by the descendants of any of these gentlemen. The taint, again, is not in the wealth, but in the giver.

Certain general principles come out of discussion which tends to lose itself in casuistry. In the great number of mixed cases it is a privilege for a man of dubious wealth to give to an honorable institution, and it is a concession to receive his gift. It is, however, the tendency of certain college presidents to descend from this position of self-respect and toady to possible donors which arouses Professor Bascom's indignation. Very bitterly and justly he scores this weakness of the churches and small colleges—"to be discontented with honest poverty, and to be willing to have cast over them, at any price, one little corner of the skirt of wealth."

It is well to emphasize this danger of a new simony which affects not the church but our great institutions of learning. Yet it is doubtful if we shall find a better rule of practice than President Pritchett's suggestion that flagrant ill-fame of the donor or discreditable conditions of the proposed benefaction alone render a gift unworthy of acceptance. Developing these principles, the *Outlook* has said very sensibly:

"If conditions are attached to the gift inconsistent with its free use in the sense to which it is nominally dedicated, it is to be promptly declined. . . . It is not their [the beneficiaries'] function to trace proffered endowments to their source, nor to put the donor on trial, still less to condemn him on public report without a hearing. They will not raise the ethical standards in the community, nor in the institution under their charge, by imputing unworthy motives to a benefaction apparently worthy in itself, nor by attaching on suspicion dishonorable conditions to a gift which is in its terms free from conditions."

ARTS AND CRAFTS IN LONDON.

LONDON, January 17, 1903.

After a little more than three years' rest, the Arts and Crafts Society has opened its seventh exhibition at the New Gallery. Most societies hold annual or even semi-annual exhibitions, so that such unusual restraint naturally leads us to expect more of these special arts and craftsmen when they do show than of most artists. Besides, the Society is supposed to be representative of all that is most distinguished and accomplished in modern English decoration. It endeavors to set the standard at home; its work has only too often been accepted as a model abroad.

I might as well admit at once that, taking these facts into consideration, the new exhibition is a distinct disappointment. Instead of any advance, any progress since the last show, there are on all sides signs of exhaustion, if not of deterioration. It seems to me that William Morris is more and more missed as the years go on. His work was not beyond criticism, his influence not beyond reproach; but there was vigor and vitality in everything he did, and a genuine love of beauty, however misdirected at times was the expression he found for it. Now, one is conscious of a prevailing feebleness and a deliberate eccentricity to conceal it. To this effect, the arrangement of the collection adds not a little. Two of the rooms have the look of a big bazaar or fancy fair, which not even the plain white background—borrowed from Mr. Whistler—in one can quite do away with. There could scarcely be a more heterogeneous jumble of things—huge cartoons and tiny miniatures, woven hangings and silver ware, book-bindings and big pieces of furniture, illustrations and enamels, jewellery and embroideries, all mixed up without rhyme or reason, so that the eye must be focussed anew at every step, and fatigue and bewilderment are the inevitable result. In the third large room, craftsmen, or groups of craftsmen, have been given each a little recess or shop apart in which to expose their strength, or, more frequently the case, their weakness. Here, the President, Mr. Walter Crane, Mr. Lewis Day, Mr. George Walton, Mr. Ashbee, Mr. Voysey, among others, have brought together, each in the space provided for him, the wall papers, crétonnes, furniture, or whatever it may be for which he is more or less directly responsible; and all that remains is for each artist, after the manner popular in the Indian or Japanese village, to be on view in his own little shop hard at work, showing how well he understands, or does not understand, the technique of the crafts he represents.

But arrangement does not count for everything when, after having philosophically made the best of it, one comes to examine the work in detail. It is discouraging to note that some of the late follies of Continental craftsmen are being re-echoed, if weakly, by English designers and decorators. It is the more curious that this should be so because there cannot be much doubt that from England came the first inspiration of those distressing curves and swirls and angular lines that have, of recent years, distracted us on any and every thing that presents a surface to be decorated—on the shop-front of the enterprising tradesman, from Amsterdam to Madrid, as on the covers of the books we read and the cups from which we drink our tea. But the unfortunate fashion began in a mild, unsuspecting way in this country, and—for lack of enterprise, perhaps—was never pushed to the mad extravagance to which Belgians and Germans and Austrians have carried it. Now, however, just as on the Continent the fashion is almost played out, English craftsmen seem on the point of giving it new life, or semblance of life, by taking not themselves but their own imitators as masters. The worst of it is that the President goes to particular pains in the "Forewords"—why will not plain Preface answer his purpose?—to the catalogue, to record the fact that England, or more particularly his Society, is, on the Continent, given the credit for having inaugurated this "new art." He quotes M. Folcka, Swedish representative on the international jury at Turin last summer, who, impressed by the "new ideal of style and beauty of lines and colors which distinguishes our epoch, and which we call—not without pride—the new art," was amiable enough to discover the origin of this ideal in England and the movement, begun "more than thirty years ago, with which are inseparably joined the names of William Morris, of Edward Burne-Jones, and Walter Crane." It is enough to make William Morris turn in his grave. That Mr. Crane did not order his Society into sackcloth and ashes, that he did not hide his head with shame at the thought of the responsibility thus so largely thrust upon him, but that, on the contrary, he seems extremely pleased, is one of the most dispiriting features of all. And I have referred thus at length to his preface because I think it helps to explain the character of the show.

Indeed, nothing short of the deliberate acceptance of a "new ideal" would account

for the furniture. It is hard to understand how English craftsmen, with the fine models left by Chippendale, Sheraton, the Adams, should have gone so hopelessly astray. That they have so little to show in this section is the one redeeming point. For, in the modern cabinet and sideboard, table and chair, bureau and writing-desk, as one sees them here, there is as little respect for structural form as for elegance of detail. Even when the simplicity of materials and general design requires an appropriate severity in the decoration, there is a tendency to over-elaboration. If the ornament were beautiful there would be less reason for criticism: one would make the best of it, as one does of so much of the old Rococo flamboyancy. But it is cheap in finish; there are no longer the beautiful mouldings that should be to furniture what they are to architecture. This year, I notice a growing use of a strip of inlay in a sort of checker-board pattern that, I am told, can be had at so much a foot; while fussy curves and eccentric lines are stuck on where they are not only ugly but useless. Or, where there is an attempt at greater refinement in materials and workmanship, as in an inlaid cabinet sent by Morris & Co., the pattern of the inlay is almost forced or tortured into prominence until you can see nothing else. I say this with the more reluctance because the cabinet is one of the best made and finished pieces of furniture in the exhibition. But I turned with positive relief to a plain, rush-bottomed oak armchair, absolutely without ornament, unpretending, and yet so uncompromising in its plainness that it has at least the beauty of consistency—of being exactly what it sets out to be. I might also except a music cabinet and writing cabinet by Mr. Henry Wilson, who has the good sense not to sacrifice art to fashion, and who realizes that austerity may have its value.

The best that can be said of the designs for carpets is that hardly any are shown. Mr. Crane does what he can with the rose, the lily, and the carnation as motives, but it is curious how tentative and immature the work of a man who has devoted all his professional life to design can sometimes look. Mr. Crane, practically only yesterday, returned from his triumph on the Continent, chiefly at Budapest and Turin. It is doubtful whether his name has ever been so well and so widely known. And yet, the more one sees of his work, the readier one is to believe that it is to his toy books he really owes and will owe his reputation. These he did extremely well, but the toy-book method seems to have pursued him through all the numerous crafts he has practised, and to many it is far from appropriate. His wall-papers I should like to see covering the wall of a room and not shown as samples, with a number of others, by the firm who produce them. The crétonnes and most of the textiles, though sent by different individuals and firms, are, as is unavoidable, exhibited in much the same way, and it is difficult to judge what their decorative merit may be when applied to the end for which they are intended. Mr. Day's work of this kind is always marked by knowledge, skill, and judgment; he knows how to fill his space so that the pattern gives the necessary color and variety to the surface without ever asserting itself; but he keeps to his well-tried conventions. His designs, in effect anyway, differ but little one year from those of the year before.

Greatest ingenuity seems, since the last exhibition, to have been devoted to embroidery. Panels and counterpanes, friezes and portières hang on the walls, cases are full of smaller and more delicate examples. One might almost fancy the hanging committee, in despair over an empty space of wall, going out into the highways and byways in search of any stray bits of embroidery to cover it. Good workmanship is common enough—most women, who put themselves to it, can master the technique of needlework; but good designs are rarer. One exhibitor has actually copied with her needle Fra Lippo's "Annunciation" in the National Gallery, a second has embroidered in four big panels life-size figures to illustrate a mystic allegory, and many others have aimed at "pictures," less ambitious in scale, but still apparently meant to rival, in silks and crewels, the variety and resources of the painter's palette. Certainly, it is the last sort of needlework one would expect to find in the exhibition founded by William Morris and based upon the principles of decorative art upheld by him. It seemed only in keeping that I did not come across anything by Miss May Morris, though it may be she has work hidden away somewhere. The catalogue supplied to me was anything but a complete guide.

Plenty of space is devoted to cartoons in black-and-white for stained glass, but none to the glass itself, so that in this section one pronounces judgment with hesitation. Mr. Selwyn Image, Mr. Anning Bell, Mr. Louis Davis, Mr. Christopher Whall, all have designs that look promising enough, though Mr. Davis and Mr. Whall treat their scriptural and other subjects with an irritating suggestion of condescension, of adapting their conceptions to childish powers of appreciation. The story of the Nativity and similar themes seem, in their decorative version, addressed to children, and I must confess this is an affectation which, to me, becomes as tedious as the opposite affectation of appealing only to the esoteric and morbid few. There is much more virility in a big cartoon, also in black-and-white, for a modelled frieze by Mr. Wilson.

Other black-and-white work there is in plenty—illustrations, book-plates, woodcuts, and so on. But in no section have the members of the Society allowed their prejudices so completely to get the better of them. They refuse to recognize that an illustration can decorate a page unless it is worked out according to formulas approved at Kelmscott and adopted by Mr. Walter Crane. When good men make use of these formulas, the results may be impressive or pleasing, as in the designs of Mr. Strang, Mr. Anning Bell, Mr. Guthrie, Mr. Eve. But in the hands of the second and third-rate draughtsman, they degenerate into empty mannerisms, tedious beyond endurance, Nowhere is contemporary illustration so inefficiently represented as at the Arts and Crafts. In examples of printing, the restrictions are as absurd, though less disastrous, since the few printers admitted really can and do turn out excellent work. The Chiswick is an old-established press that maintains its high standard; the Doves Press, and the Vale (really the Ballantyne Press) have produced beautiful books when they have managed to forget their affectations, and I am glad to see that the worst faults of the Kelmscott Press are not so fondly cherished as of yore by the admirers of Morris. The Vale Press makes some concession to the prevailing mode by exhibiting books decorated in color, but the color is used in simple flat tints, and with a reserve that might give a lesson to those American printers who are now rioting in the three (or other)- color processes. It is a pity the same reserve is not shown in the decoration of the page. One, at least, of the books from this Press, Bacon's essay on Gardens, decorated by Mr. Pissarro, is open at a page in which the few lines of text are all but swallowed up in the profuseness of ornament. Technical excellence, not a common virtue among English craftsmen, also distinguishes some of the book-bindings by Mr. Douglas Cockerell, Mr. Cobden Saunderson, and Miss MacColl; and the simpler the decorative scheme, the less attempt there is to express the unutterable in symbolic curves and significant curlicues, the more workmanlike, the more really beautiful they are. I should point to a binding for a large edition of the Bible by Mr. Douglas Cockerell, severe in its absolute simplicity, as the most successful of them all; that is, from the point of view of the artist.

More space, probably, than ever before is given to metal work and jewellery. Copper and brass are apt to be hopelessly abused, and twisted or elongated or curved into "new art" novelties, when they are not brutalized by a clumsy scheme of ornament. But ocasionally an exhibitor, like Mr. Rathbone, who in large designs seems to lose all sense of grace and appropriateness, does remember that there can be beauty in simplicity of form and line when he designs such small articles as candlesticks and jugs. The Guild of Handicraft, who are as affected as anybody when they choose—or more so—have their lucid moments of simplicity, and some of their silver dishes and chalices are graceful enough in shape, with all the charm of plain surfaces, to need no further ornament. But Mr. Alexander Fisher is the best silversmith of them all. Sometimes, as in a very fine crucifix he is now exhibiting, he combines silver with enamel so that the harmonious scheme of color satisfies the eye as completely as the grace and dignity of design. His work of this kind is so distinguished and shows such a right feeling for the limitations as well as the possibilities of his materials, that I can forgive him the less for his zealous but mistaken excursions in enamel, when, as in a triptych illustrating the text, "Behold, I stand at the door and knock," he lets technical experiment run away with him until, in striving for the color that probably no one has ever got in enamels before, he loses sight of the fact that it is not worth getting at all.

Something of this same sense of and seeking for color is revealed in the glass in conjunction with metal, as shown by Messrs. Powell, and also in the jewellery. Precious stones and precious metals and enamels are, now and then, used as a painter uses his paints to produce a harmony, with exquisite results, though the English jeweller in his technique has still much to learn from the French craftsman. Besides, as jewellery is the fashionable craft of the moment, many seem to have gone in for it simply to make the most of the fashion while it lasts. There is a good deal that is deplorably crude, and it is matter of regret

that Mr. Henry Wilson, of whom so many exhibitors are but feeble and far-away imitators, sends nothing. Again, though a few years back the object of the arts and craftsman in his jewellery was all to imitate the barbaric limitations of primitive ornament, taking peasant work for his model, now he aims at elaboration and effects quite beyond the province of his medium. But, after all, it is here you have the root of the evil felt in almost all the decorative arts of to-day. The craftsman seems to be without definite aims or principles. He has heard a great deal about the virtue of individuality, and his entire energy is spent in cultivating it rather than his art. Now it leads him back to primitive masters who have long since been surpassed; now it brings him to the feet of "art" promoters launching a new fashion In neither case does he ever forget himself for his work, and thus we have self-conscious eccentricity instead of the genuine love or serious study of the principle of design without which there never has been and never can be great decoration.

Correspondence.

BOOKS AS TOOLS.

To the Editor of The Nation:

Sir: Francis Darwin, in the 'Life and Letters of Charles Darwin,' states that his father had no respect for books as books. He left them unbound and falling to pieces; he did not scruple to cut a heavy volume in two for convenience of holding; in short, he regarded books simply as tools to work with. And as for pamphlets, "he would tear out, for the sake of saving room, all the pages except the one that interested him."

This treatment of unbound literature is not uncommon among modern scholars, and the urgency of a pressing need is not unlikely to subject costly books to the same unceremonious ordeal. Darwin's system of the tabulation of data has been followed by not a few investigators, who realize the treacheries of memory, and foresee the inevitable future waste of time and effectiveness which the non-systematic student invites. A system for the speedy and voluminous filing of information has become a *sine qua non* of modern scientific scholarship.

Some investigators, able to value their time above the extra expense, attain their ends by elaborate transcripts, done by hired amanuenses, and thus avoid Darwin's "bibliophagy," from which the lover of books recoils. But such assistance is beyond the means of most scholars, and the only alternatives are laborious copying with their own hands, or some adaptation of Darwin's practice. The former alternative plunges one into an abyss of hackwork, and few there be who do not shirk it. Following Darwin's plan, others resort to the purchase of two copies of the most important books of reference, and ruthlessly cut one or both, so as to be able to paste the excerpts upon their uniform note-cards and file them away. This method certainly avoids the untidiness of the shelves at Down, but it involves no small expense and an unnecessary waste of bookmakers' labor.

The problem is solved, however, in the case of some publications, notably the 'Advanced Sheets of the U. S. Consular Reports,' which are a boon to the note-collector. These are printed upon one side only of a thin, but durable sheet, and so lend themselves readily to cutting and pasting, a single copy being all that is necessary. Again, one is sometimes so fortunate as to get a galley or page proof of a review article, and thus is enabled to dodge a deal of uncongenial toil. The great saving in such cases of time, labor, and expense to the scholar raises the query, Could not publishers afford to undertake an advance subscription edition, at a moderate price, of the text of new and important scientific works and articles, to be issued in page proof, unbound, uncut—in fact, simply accurately and clearly printed? The advantages to the investigator of such a system are self-evident.

From the publishers' standpoint, likewise, it appears that there would be something to gain. Few scholars are willing to have notes alone, and no library; nothing can, after all, replace the volume on the shelf. Such an edition would be likely to affect sales but slightly, while it would advertise the book to a considerable extent and in the right quarters. Again, the presentation-copies account would be considerably reduced, together with postage and express-age. And even though the undertaking realized a slight loss at first, the prestige of the firm or bureau which should take it up would be of no small importance.

Of the net business value of such an enterprise, of course, no layman can presume to judge; but the demand for some such system, already faintly outlined here and there by the appearance of tentative efforts to meet it, is sure to grow in the future, if science is to advance.

Albert G. Keller.

Yale University, January 30, 1903.

Notes.

Mr. Thomas Willing Balch, 1412 Spruce Street, Philadelphia, will shortly have ready a monograph on the Alaskan Frontier, containing 26 maps, some very rare, and some "absolutely conclusive evidence against Canada and England." Mr. Balch has journeyed very extensively for his material.

A diligent historian, Mr. Julius F. Sachse, is preparing to issue by subscription a fifth volume in a related series, entitled 'Justus Falckner, Mystic and Scholar, Devout Pietist in Germany, Hermit on the Wissahickon, Missionary on the Hudson: A Bicentennial Memorial.' The edition will be limited to 500 copies, royal 8vo, and will be published by the author at No. 4428 Pine Street, Philadelphia.

Doubleday, Page & Co.'s spring announcements include 'The Life of James Madison,' by Gaillard Hunt, the first volume in the "Biographical History of the United States"; 'The Story of My Life,' by Helen Keller; 'Essays on Education,' by President Eliot of Harvard; 'The Nature-Study Idea,' by Prof. L. H. Bailey; 'The Moon,' by Prof. William H. Pickering; 'Macbeth,' the first volume in Professor Liddell's "Elizabethan Shakspere"; 'Principles of Home Decoration,' by Mrs. Candace Wheeler; 'How to Keep Well,' by Dr. Floyd M. Crandall; 'How to Make Money: Eighty Practical Suggestions to Untrained Women,' by Katharine Newbold Birdsall; 'The Wind in the Rose-Bush,' stories of the supernatural, by Mary E. Wilkins; and 'The Conquering of Kate,' by J. P. Mowbray.

Macmillan promises for next month 'Athletics and Outdoor Sports by Women,' by numerous hands, introduced by a general introduction by Miss Lucille Eaton Hill, Director of Physical Training at Wellesley College.

'Horses Nine: Stories of Harness and Saddle,' by Sewell Ford, and 'The Meaning of Pictures,' by John C. Van Dyke, are in the press of Charles Scribner's Sons.

'Written in Florence,' a collection of the last poems of Hugh McCulloch, grandson and namesake of the former Secretary of the Treasury, is announced by Little, Brown & Co., Boston.

The New Amsterdam Book Co. have nearly ready a reprint of Daniel Williams Harmon's 'Journal of Voyages and Travels in the Interior of North America"; an unabridged reprint of Freeborough and Ranken's 'Chess Openings'; likewise of 'Joe Miller's Jestbook'; and 'The Life and Voyages of Americus Vespuccius,' by C. Edwards Lester.

A new and enlarged edition (the tenth) of Dr. Griffis's 'The Mikado's Empire' is to come from the Harpers.

The Chicago University Press will issue 'The Poems of Anne Countess of Winchelsea,' edited by Myra Reynolds.

The Bowen-Merrill Co. of Indianapolis has changed its style to the Bobbs-Merrill Co., in accordance with its present composition.

John Woolman's Diary for the pocket and a quarter of a dollar presents an irresistible combination. Such is the latest addition to Macmillan's "Pocket American and English Classics." There are a few notes at the end.

The Dent-Macmillan Thackeray makes a new volume of that author's 'English Humorists' and 'Four Georges,' separated by a New York charity lecture on "Charity and Humor." Mr. Charles E. Brock supplies some fitting illustrations and embellishments, and Mr. Walter Jerrold, as usual, provides the preface. This editor is unlucky enough to correct a long overlooked error in a footnote on Steele, and to let pass on the opposite page of his preface a mutilated line from Boileau, where "réjoin" stands for "réjoui."

The delightful Newnes-Scribner "Caxton Series," in limp blue-and-gold covers and with etched frontispiece and title-page, besides other illustrations, arrives at Herrick's 'Hesperides,' in two volumes suitable for hand and pocket or satchel. It has an index of first lines, but no other apparatus. Another issue in the same series is Lodge's 'Rosalynde,' equally handy and ornamental.

Mr. John Lane brings up his tiny reserves with the 'Love Poems of W. S. Blunt' ("Lover's Library"), framed in violet and printed in green; and with Milton's 'Lycidas' ("Flowers of Parnassus," xvii.), whose illustrations, by Gertrude Brodie, are decorative and in keeping with the spirit of the poem.

By reprinting Gov. Cadwallader Colden's 'History of the Five Indian Nations' the New Amsterdam Book Company has made accessible a book of some scarcity and

value. There is a new introduction by Mr. Robert Waite, which, strangely enough, contains no bibliographical information whatever, not even a suggestion that the History had ever been in type before. This leads us to wonder whether the publishers are aware that they have served up merely the London reprint of 1755, with all its imperfections, instead of the very rare and interesting original (New York: William Bradford, 1727).

In 'The Legends of the Iroquois,' by William W. Canfield (A. Wessels Co.), we have a number of tales, mostly of Iroquois origin, but frequently containing a strong admixture of Algonquin material, and showing the influence of European contact as well. In his lack of the critical faculty the compiler occasionally suggests the late Henry R. Schoolcraft, author of voluminous and irrelevant writings on the same subject. Thus, it is remarked that "the traditions of the Iroquois herein contained are known positively to be two hundred years old, and are confidently believed to be the stories told by the red men thousands of years ago." Such, in the form here presented, several of them certainly are not; yet, when rightly classed, the book which Mr. Canfield's patient researches have produced is of real interest and value. It contains some very ancient stories, a few simple and unaltered, others recognizable in spite of recent embellishments; and the compiler, by faithful and sympathetic endeavor, has presented his material in a form attractive both to the specialist and to him who reads for pleasure. The notes contained in an appendix are often ingenious and suggestive, and might have been made more accurate and complete had the author been familiar with the writings of Horatio Hale and Lewis H. Morgan.

Mr. Charles Moore, whose papers in the *Century* on the "Improvement of Washington City" we noticed a year ago, has edited for the Government Printing-Office a volume on the 'Improvement of the Park System of the District of Columbia.' It contains reports of the Senate Committee, of which Mr. Moore is clerk, and also of the Park Commission, consisting of Messrs. Daniel H. Burnham, Charles F. McKim, Augustus Saint-Gaudens, and Frederick Law Olmsted, jr. This latter report occupies the bulk of the volume, and is illustrated by scores of full-page plates and many larger views, showing the proposed treatment of various parts of the city *in extenso*. Many of the plates represent parks, fountains, etc., in various other cities, American and European. Appendices deal with such subjects as Public Bathing Places, Anacostia Park, Rock Creek Valley, list of drawings, designs, and models collected for the use of the Commission and now on exhibition in the Library of Congress, and list of lands devoted to public use. There are also a number of large maps. It will be seen at once that the volume is of great importance to persons interested in civic improvement. It is designated as Senate Report No. 166, Fifty-seventh Congress, First Session, or it may be called for by its serial number in the Congressional Series, which is 4,258.

'Henry Grattan,' an essay by Alfred E. Zimmern (Oxford: B. H. Blackwell), has merit beyond its bulk. It will impress many readers as the most important contribution to the understanding of the life and policy of a great Irishman that has appeared since Mr. Lecky's essay on 'The Leaders of Public Opinion in Ireland,' which was first published anonymously forty years ago. If Mr. Lecky then was partially responsible for the rise in an educated circle of home-rule principles, it is to be hoped that Mr. Zimmern's essay will now help towards an enduring settlement between Great Britain and Ireland. Unbiassed truth is not always welcome to either party in a quarrel, and there is something of the bitterness of truth in these pages. The author, though not sparing what he considers the weaknesses and limitations of Grattan's powers and genius, does full credit to their greatness and splendor—especially to his limpid honesty and his patriotism. Upon the world's stage he may not have been great; he was so upon the stage of his country. The work is mainly a review of the political relations of the British Islands as influenced by Grattan's life and teachings. An elaborate review of it would tend more to a political dissertation than to a consideration of Grattan's life. The style is clear and interesting. As the future of Ireland most depends upon the exercise by Irishmen of their own good sense, to them especially we would commend the work before us.

Samuel Smith ("Sammy," as some of the less reverent members of the House of Commons call him), M. P. for Flintshire, is one of the most conscientious and philanthropic members of the British Parliament. In 'My Life-Work,' lately published by Hodder & Stoughton, London, a closely printed volume of over 600 pages, he gives to the world a record of his life, and his opinions upon all imaginable subjects, from bimetallism and home rule to the descent of man and Bible inspiration, and tells how from a Scottish farmer boy he has risen to be a wealthy Liverpool merchant and for long years the representative of a Scottish shire. His portrait faces the title-page; and photogravures are given of his wife and son (whose deaths have left him alone in the world), and of many of the places he has visited in his repeated wanderings over the globe. The simplicity of the man, and the spirit earnest for good that shines through the pages, disarm criticism of the book from a literary point of view.

Munich is the Mecca of palæontologists, and Prof. Karl von Zittel has done more than any living man, through his comprehensive work, 'Handbuch der Palaeontologie,' published between 1881 and 1885, to bring palæontology within the reach of students in all parts of the world. This work has been translated into every language, except English. In 1895 the same author issued his 'Grundzüge der Palaeontologie,' a work condensed from the four volumes of the 'Handbuch' to a single volume of nearly a thousand pages. Into this volume is crowded an epitome of the whole fossil record of the world from the dawn of life to the advent of man, a period of millions of years. It is richly illustrated from the rare collections in Munich, and from other parts of the world. Dr. Charles R. Eastman, of the Museum of Comparative Zoölogy of Harvard, has rendered a decided service in translating the latter work ('Text-book of Palæontology'), revising it with the assistance of a number of American and English palæontologists, and bringing it up to date. The first part of the translation appeared in 1896 (Macmillan), and covered the invertebrates. The present, second part covers the older vertebrates, fishes, amphibians, reptiles, and birds. The third part, yet to appear, will cover the mammals. The whole work is admirably done, and constitutes the best treatise in our language on this entire branch of science. The section on the fishes, by Dr. A. Smith Woodward, of the British Museum, a leading authority, is naturally the part in which the most original work appears. The systematic arrangement of the groups is rather conservative, as it was not the intention of the author to depart widely from the lines laid down by Von Zittel, this having been one of the features most criticised in Park I. The volume is admirably printed and illustrated, and will find its way into the hands of all American and European students of this subject.

The appearance of the second volume of the Catalogue of Greek Manuscripts in the Italian Libraries, from the pen of the indefatigable E. Martini, who, in 1893, issued the first volume devoted to the smaller collections of these manuscripts, is all the more gratifying because it contains the description of the treasures found in Vallicelliana in Rome, which, including the manuscripts of Leo Allatius, embrace 221 numbers. Many of these are late productions, and their contents are of a theological character. The secular specimens are particularly rich in grammatical literature of the Byzantine period, including in its oldest portions two copies of the so-called Lexicon of Cyril. Not a few of these documents, after the manner of those of the fourteenth, fifteenth, and sixteenth centuries, are filled with extracts from various writers. The author of this work announces one still more important, namely, Catalogue of the Greek Codices of the Ambrosian Library in Milan, which he has had in preparation for several years in conjunction with his friend Bassi. The collection includes some 2,500 numbers, and is especially rich in patristic and Byzantine literature. The zeal evinced in recent years in the work of cataloguing the Greek manuscripts of Italy, especially by Vitelli and Martini, awakens the hope that the Marciana in Venice, the Laurentiana in Florence, and especially the Vaticana, recently augmented and enriched by the Barberini collection, will also soon be made accessible to scholars by satisfactory catalogues.

The great Muret-Sanders Encyclopædic Dictionary of the German and English Languages, no doubt the most exhaustive dictionary of these two languages extant, has not only been completed in the unabridged edition, but a "School and Hand Edition," in two volumes, has also been published. The English-German part contains 845 three-column pages, quarto size, and the German-English 889. The former is the work of B. Klatt, and the latter of H. Baumann, author of an excellent collection of 'Londonisms' in a separate small volume. The new abridgment of Muret-Sanders has evidently been very carefully done; if anything, it contains too much and not too little. Both editions are especially rich in difficult and rare words, expressions, and definitions. The reader rarely consults them in vain. The publishers are the Langen-

scheidt house, of Hamburg. Each volume of the school edition costs 15 marks.

The Messrs. Scribner's *Lamp* is merely an old acquaintance, the *Book Buyer*, under a new name. If the first volume of the new series may serve as a basis for generalization, the *Lamp* is likely to be more hospitable to longish essays than its predecessor was. Otherwise, as an editorial note advises us, this is not a new magazine, but a development of an old. Most interesting among the articles is, perhaps, Elizabeth Luther Cary's "John Adams and Mary Wollstonecraft" — strange running mates even in a casual essay. John Adams in his old age read 'The History of the French Revolution,' by Mary Wollstonecraft (his copy is now in the Boston Public Library), and enriched it with his notes. Perhaps one should rather say his objurgations, for John Adams was little in sympathy with the vivacious apologist of the Revolution.

The *Literary World*, Boston, founded in 1870, has passed into the hands of L. C. Page & Co., and under the editorial direction of Mr. Bliss Carman.

Of decided interest to scholars is the first number of the *Journal of Comparative Literature*, which has just come to hand. This new quarterly is edited by Professor Woodberry of Columbia, assisted by his colleague, Dr. Spingarn, and by Prof. J. B. Fletcher of Harvard. The present number contains the editor's explanation of the meaning of Comparative Literature, the first instalment of a study of "Huguenot Thought in England" by Professor Bastide, some "Unpublished Letters of an English Humanist," John Phrea (who studied at Ferrara about the middle of the fifteenth century), edited by Dr. Spingarn. "Molière en Italie," by Professor Toldo of Turin, is the last of the longer articles. Departments of notes and reviews complete the roll. The international and learned nature of the publication is indicated by the use indifferently of English, French, and Italian in the articles, while the absence of Germany is undoubtedly fortuitous, and of no political import. McClure, Phillips & Co. publish the magazine, and give a beautiful impression in bold-faced type on creamy paper.

A new Italian review, *La Critica*, has just appeared at Naples, under the editorship of Signor Benedetto Croce, whose 'History of Æsthetics' was reviewed recently in these columns. The new venture is devoted to the advancement of general culture in Italy, and to the synthetic statement of modern Italian ideals. A brilliant study of Carducci by the editor opens the first number, and is followed by a series of trenchant reviews of recent publications, both Italian and foreign, in the fields of literature, philosophy, and history.

Two additional sheets of the New Jersey State Atlas on the enlarged scale of two inches to the mile have just been put forth by the State Geological Survey at Trenton. The one embraces the tract from Trenton (inclusive) to Bordentown and eastward; the other shows Atlantic City, and the adjacent coast and ocean. They are named for the capital and the watering-place respectively, and, like the original inch-to-the-mile series, are to be had of the Survey for twenty-five cents each. Superficially considered, they lack the interest of more elevated regions in the same State, but geologically and economically they are of no little importance.

"Small service is true service," says the poet, and Mr. José Sirvent "(American citizen, 1921 Vermont Avenue, Washington, D. C.)" reminds an ungrateful republic of his, viz., in drawing up "12 Rules to Divide Words in Spanish," which "forever" ensures accuracy in the Spanish printing of our Government Printing-Office, where the rules have been adopted with thanksgiving. Wherefore, "the author now presents his petition to the end that the Congress of the United States may see fit to grant him some suitable compensation." There were, however, brave men before Agamemnon. The Government Printing-Office's neglect of an easily accessible guide in this matter, viz., the rules given in Professor Knapp's twenty-year-old Spanish Grammar, and reprinted by permission in Mr. De Vinne's 'Correct Composition' (1901), hardly justifies Mr. Sirvent's petition—all the more because his rules are incomplete, as any one may see who compares the two.

—Thomas A. Janvier begins in the February *Harper's* an attempt to extricate the Dutch settlers of Manhattan from the web of misconceptions woven about them by the subtle art of Washington Irving. In general the charge against Irving is that over the bare facts, which it is admitted that he collected with surprising accuracy, "he has cast everywhere the glamour of a belittling farcical romance." And more particularly he has painted a set of sleepy, tobacco-loving loiterers in place of a hard-headed, hard-hitting, ever strenuous band of adventurers. When Mr. Janvier succeeds in rescuing them from Irving, it is odds that some other defender will appear in their behalf against Mr. Janvier himself, for he dubs them a rough lot, who "did not come here for their health"; ready to cheat the Indians at all times, and one another on due occasion. Snarling litigators they were among themselves, consistently evading the revenue laws of the colony, and contemptuously breaking any other law which at any time got in their way. But at the present day it may be that the saving grace of strenuosity will cover even such a multitude of sins. Professor Woodberry writes of the "Literary Age of Boston," enumerating its six greatest names in relative rank as Emerson, Longfellow, Hawthorne, Holmes, Whittier, and Lowell. Many will welcome his strong defence of Longfellow against current depreciation, but perhaps a larger number will resent what seems an undue disparagement of Lowell. To say that Lowell "now seems essentially a man of letters of high endowments, having the accomplishment of verse with his many other rich and varied gifts, and no more than that," and that "his prose is of a transitory nature and steadily grows less interesting," is hardly satisfactory. As between Holmes and Whittier, some may be surprised to read that Whittier had vastly the greater range, but the assertion will bear the test of investigation. Studied in the light of a real knowledge of Whittier, the common belief that a hobby inevitably narrows a man must be admitted to have exceptions.

—In the February *Atlantic* President Hadley begins a broad study of "Academic Freedom in Theory and Practice." On the one hand, we have in every age a set of institutions with the permanence of which the safety of the State and the citizen seems to be bound up; on the other hand, the scholarly investigator, filled with the conviction that he has unearthed new truth the propagation of which is essential to further progress. Position and training fit trustees, donors, and the conservative forces of society in general to appreciate the one side of this antithesis, the teacher to appreciate the other. The problem, then, is to soften this antithesis, and so to order our activities as to secure the advantages of the discovery and propagation of new truth without any dangerous shock to existing institutions. Mr. J. T. Trowbridge carries the story of his life through the fifteen months spent in New York city, ending in August, 1848, the period of first encounters with editors and publishers in his efforts to secure a living by his pen. Under the heading of "The Literary Pilgrimage," Rollin Lynde Hartt gives a somewhat amusing account of the woes brought upon his head by his recent efforts to "see life steadily and see it whole" in Iowa and other Western States. But perhaps the most interesting article of the number is a short study of Libin, the untrained Yiddish writer who has recently come into prominence by his realistic sketches of the submerged East Side life, of which his own life forms a part. Here we have realism due to no oppressive theory, but to an unsophisticated outburst of reality itself. The question remains whether the product is to be classified under belles-lettres or sociology. In writing briefly of the 'Cambridge Modern History,' Prof. Ephraim Emerton contends that the new science of history can never find its true response in the world until it discovers its own form of artistic expression. As literature is its only medium, we are to look forward to a new era of artistic historical composition, new in the sense that it must be adjusted to a scientific method not in vogue when the artistic historical writing of the past was achieved.

—The Variorum edition of Edward FitzGerald's writings (the letters excepted) is not quite completed before a reissue (also in seven volumes) of everything that his literary executor has put forth is begun by Macmillan. That is to say, we shall have all that was contained in Mr. Aldis Wright's three-volume edition of 1889, now out of print; the subsequent Eversley edition (in two volumes) of the letters alone, augmented; the volume of letters to Fanny Kemble; and the recent volume of 'More Letters.' All the correspondence will now be arranged in chronological sequence. Such is the final monument, not a stone added except in the way of correction or spare annotation. Thus, FitzGerald's Spanish studies are carried back to 1850 rather than 1853, as formerly; and the first two stanzas of his lines "To a Lady Singing" (letter to Allen, December 7, 1832) have been recovered. On the other hand, in the new second volume, in connection with that wonderfully feeling tribute to Major Moor, the footnote (as in the 1889 edition) quotes a related passage from another letter which meanwhile has been printed entire in the Eversley edition, and here reappears only five pages off. This is an editorial oversight, but serves to indicate that Mr. Wright was originally possessed of more than he chose (perhaps from considerations of bulk)

to give out; or perhaps he was feeling his market. The two volumes before us, richly bound in red silk, surpass the three of 1889 typographically only in the largeness of the print of the main text. In other respects we find the earlier typographic scheme the more elegant, and no less legible in the notes. But these liberal pages are good for old eyes, for a show of reverence, and for reading aloud, not privately, but to a sympathetic company. We cannot believe they will ever stale from reperusal, exciting such unfailing interest in the writer's personality, and bearing such enduring lessons in taste and criticism, in sentiment, in English epistolary style, such reflex portraiture of the correspondents addressed. In other fields than literature, FitzGerald's rare excursions show the sane mind of the genuine humorist. "I am no politician," he writes to Allen (October 31, 1835) of the new Poor Laws; "but I fear that no political measure will ever adjust matters well between rich and poor." And again, in Sepoy times (August 15, 1857): "As to public matters, I scarcely meddle with them, and don't know what to think of India, except that it is very terrible. I always think a Nation with great Estates is like a Man with them:—more trouble than Profit; I would only have a *Competence* for my Country as for myself." It is hard to refrain from further excerpts from these letters, whose periodicity suggests the tidal lives of limpets and such creatures on FitzGerald's own Suffolk shore.

—Mr. Joseph McDonough, Albany, has had reprinted (*verbatim et literatim*) for himself five hundred copies of a work which more than forty years ago showed the following title-page: 'Early Voyages Up and Down the Mississippi by Cavelier, St. Cosme, Le Sueur, Gravier, and Grignas. With an introduction, notes, and an index, by John Gilmary Shea.' McDonough has thus honored Shea with a monument which would have pleased him better than could any statue. He has paid a fitting tribute to a man who, through the third quarter of the last century, was one of the few scholars who most promoted the publication of what are now called source-books of history. Such sources he detected, begged, borrowed, bought, translated, and, through the art preservative, not only saved when ready to perish, but made popular, influential, and prized up to their real value. In 1861 his 'Early Voyages' could not have been printed in more than a hundred copies. The subscribers for it were seventy-two, five of them for such large paper copies, 7x9 inches, as McDonough has now reproduced a hundredfold. Shea was still a voice crying in the wilderness. His volume, which he was first to translate from French—largely from manuscripts—was throughout from chroniclers either forgotten or newly first printed. But it furnished at first hand La Salle's last attempt, as described by his brother, to force a passage from Texas to the Mississippi, and the last letter that hero is known to have written. Its main contents are, however, voyages about 1700 up and down the great river, one of them of sixty-five days, with jottings day by day. These were path-findings, but epoch-making, as they show the first French permanent occupation, just forestalling both Spaniards and English, with stations from Wisconsin to Louisiana; and one voyage was as late as 1728. Faith, fur, and false fancies concerning copper and blue clay enkindled strange inspirations. Shea speaks of French, English, and Spanish flags floating on the mighty river and disappearing within a century; and, going to press in 1861, adds: "Two now divide it; let us hope that the altered flag may soon resume its original form," etc. Shea's volume abounds in explanatory footnotes. There are thirty relating to Le Sueur's voyage up the river to where Mankato now stands and (meaning "blue clay") marks the spot where that adventurer dug an earth more precious, as he trusted, than porcelain. The chapter on Le Sueur, borrowed from Shea, has just been republished in the Collections of the Wisconsin State Historical Society (vol. xvi., pp. 177-194). The Wisconsin editor has added twenty notes such as Shea himself would have added had recent finds been made earlier. Our only regret is that McDonough's reprint was not made perfect by notelets on similar lines.

—'Insurance and Crime,' by Alexander Colin Campbell (Putnams), is "a consideration of the effects upon society of the abuses of insurance, together with certain historical instances of such abuses." While inconclusive as to remedies, this volume of 400 pages has some value as a record of crime and fraud in connection with insurance. As insurance grows, so crime in connection with it grows. The Pitezel-Holmes story (p. 243) is as extraordinary a narrative of crime as any to be found in history, and shows that the astuteness of the criminal is ever on the alert to keep pace with the developments of the business on which he preys. But this is no more true of insurance than of any other department of human activity. The Humbert frauds, for instance, show that crime keeps pace with law and banking. The author seems himself to look for little improvement from legislation, and would rely mainly on public opinion to cut off openings to crime in connection with insurance. On one specific point he desires to focus public attention—"the practice, which may be said to be universal in insurance, of employing canvassers to bring in business, and paying those canvassers by a commission on the premiums they bring in." A Royal Commission in England has, it seems, taken up the commission system in connection with child insurance, and it is, as the author says, "obvious to every man" that the agent paid by commission "has a constant interest in favor of getting much business as against getting good business."

—Each fresh work from M. Jacques Reich's etching-needle shows a steady advance in technique, while he continues to cultivate the large scale. We have just received from him a striking copy of the Stuart Washington deposited by the Boston Athenæum in the Museum of Fine Arts of that city, and a copy, of equal size, of Rembrandt Peale's portrait of Jefferson, in the possession of the New York Historical Society. In the case of the Washington, the unfinished canvas is shown as in the original, so that the lower third of the print is like a foam out of which the severe head arises against a dark background. Jefferson, with fur-trimmed coat and flowing hair, is completely etched, and presents his philosophic aspect. The eye and the whole muscular play of the features reveal a more curious, flexible, and interesting mind than his great compeer's. Both these etchings must be pronounced adequate, and neither is superfluous, in spite of the innumerable reproductions of the Stuart painting, and Mr. Reich and the public are to be congratulated on these notable additions to the best section of our national portrait gallery. Mr. Reich's address is 2 West 14th Street, New York.

—The Archæological Society of Athens has just published its Report (Πρακτικά) for 1901, giving summary accounts of the work of that body, to which is intrusted the care of the monuments and museums of Greece. The income of the Society is derived from a lottery, for which it has the monopoly in the kingdom, and this income is to be increased, since the Parliament has voted to allow the sale of a larger number of tickets. A considerable part of the work of the Society is the preservation of the monuments of antiquity. Thus, for five years it has been engaged in strengthening the ruins of the Parthenon, and now it is about to undertake more extensive repairs for the Erechtheum. It has built several museums, and is enlarging that at Corinth for the protection of objects found in the American excavations there. The heaps of rubbish which have disfigured the slopes of the citadel of Mycenæ since Schliemann's excavations a score of years ago have been removed, at least in great part. At Dimini and Sesklo in Thessaly have been discovered the only citadels of the stone age yet found in Greece proper, with implements of stone and bone, and images of stone and clay. A large Roman building of the early Christian period has been uncovered at Megalopolis. The expenditures during the year for antiquities for the museums were very trifling, only about $120. A new law not only forbids the exportation of any objects which the Society desires, but declares such objects to be the property of the Society, awarding to the finder such remuneration as the Society may think proper to give. For the first time in many years, the Society sends young archæologists to study archæological methods in Germany. Greece has no archæologists outside of Athens, and trained students are sadly needed to care for her provincial museums, properly arranging and cataloguing their contents, with due appreciation for the works of antiquity discovered in the district. Thus, while Germany and France, as well as Great Britain and America, are sending young men to Greece for the study of classical archæology, the Greeks are sending their students to German universities. Both courses are wise. German and American students need to study the monuments themselves, and the Greeks will profit greatly by the more scientific methods of German universities.

A RE-ESTIMATE OF CARLYLE'S FRENCH REVOLUTION.

The French Revolution: A History in Three Parts. I. The Bastille; II. The Constitution; III. The Guillotine. By Thomas Carlyle. A new edition by C. R. L. Fletcher, M.A. In three volumes. London: Methuen & Co. 1902.

Sixty-five years ago and more, Carlyle charmed or offended, but in any case as-

tounded, the world of letters by his 'French Revolution.' The time has come to inquire what is the permanent worth of a book which at any rate purported to be a history?

To this inquiry Mr. Fletcher's admirable edition supplies, for any intelligent reader, something approaching to a final answer. Of the editor's labors we may say here, once and for all, that it is impossible to speak in terms of too high praise. He leaves Carlyle's own words absolutely untouched; he elucidates, in the strict sense of that word, just the points which Carlyle leaves obscure; he affords corrections of his author's actual errors, which are considerable, and supplies to students the means of attaining a knowledge of revolutionary history which is not to be gathered from the writings of Carlyle. Mr. Fletcher, lastly, gives an estimate of Carlyle's rank among historians, which anticipates, we are convinced, the enduring judgment of the world.

"People," he writes, "would be able to be much fairer to Carlyle if his book were called 'Pictures in the French Revolution,' instead of 'The French Revolution: A History.' Nobody can now call it a history, for it is a series of pictures merely, of almost equal literary merit, but of singularly unequal literary importance. . . . Primarily, then, the book is to be regarded as a series of pictures, and in these pictures a few great portraits stand out prominently on the canvas. . . . There are failures in the portrait gallery no doubt—one or two very bad failures, shown to be such by historical investigation since his time; yet, considering the small number of documents and books he can have had at his disposal, and the comparatively small number of even these which he read, it is the strongest proof of his insight that he was able to draw such wonderful portraits of the principal actors."

This passage, which, with regret, we are compelled to curtail, suggests the right point of view from which to regard Carlyle's work. His gift for portraiture was the talent which in 1837 arrested the attention and won the admiration of the public. That the portraits had the exaggeration and the monotony of caricatures, no more told against their effectiveness than the exaggerations or mannerism of Dickens prevented all England from roaring with laughter over the humor of Pickwick. Englishmen did not then possess anything like a readable history of the Revolution. "No great pretence at historical accuracy—not [Carlyle's] forte at any time—could be made in 1837; but it was time that England got some picture of the whole thing, and there was enough material at hand for the broad outlines to be filled in; this task he accomplished, I think, with a master hand."

It must be remembered, too, that in 1837 there prevailed two opposite views of the revolutionary movement, neither of which could satisfy the reason or the sentiment of thoughtful men among the then rising generation. The Tory doctrine (which, at a time when men lived who could well recollect the Reign of Terror, had many adherents), that the French Revolution was nothing better than an outburst of democratic folly and wickedness, was becoming obsolete. The conviction of the Whigs that revolutionary violence had been a transitory and subsidiary feature of a movement which had finally ended in the establishment, under Louis Philippe, of a Constitutional monarchy after the English model, was a comfortable creed, well suited to please men who believed that the Reform Act of 1832 was the greatest of statesmanlike achievements, and had put an end to all that was wrong in English society; but this optimistic faith, while it took no account of the spirit of the Revolution, brought no satisfaction to reformers who imagined, whether rightly or wrongly, that English politics and English society stood in need of fundamental renovation. To such men Carlyle opened a new view of the Revolution: he taught them that it was not so much a political event as a social, or rather a spiritual, reformation. From the beginning to the end of his book he proclaimed that the Revolution had put an end to shams and cant, and had opened the way to a reign of truth which would substitute realities for fictions.

It is, indeed, a singular sign of the change worked by the lapse of more than sixty years that this "gospel," to use an expression of Carlyle's school, which in 1837 formed half the charm of his 'French Revolution,' receives no notice whatever from Mr. Fletcher. But Mr. Fletcher's silence is wise. Carlyle's ethical or religious dogmas have absolutely nothing to do with our judgment on the course of events in France, and his doctrine, which meant so much to men such as Sterling, Kingsley, or Froude, and which certainly had its effect on the minds of thinkers as weighty and serious as Maurice and John Mill, is now, whatever its intrinsic merit, of little interest to the world. Carlyle's eternal truths are as much forgotten as the numerous Constitutions of France, which, though intended to endure forever, have lasted on an average for not more than ten or twelve years. But teaching which is obsolete has often produced immense effects in its own day, and Carlyle's reiterated sermons on such texts as "Light mortals, how ye walk your light life-minuet over bottomless abysses divided from you by a film!" immensely added to the impressiveness of the popularity of his 'French Revolution.' The success, then, of the book was due in the main to three causes—Carlyle's genius as a painter of historical scenes; the new light in which he presented the revolutionary movement; the moral teaching of which history in his hands was made the support and the illustration.

The effect, therefore, produced in 1837 by the appearance of Carlyle's book admits of easy and complete explanation, but some of the very circumstances which contributed to the success of the book must make it very doubtful to a calm critic of 1902 whether it will permanently retain anything like high rank among histories. The truth is that the book reflects the character of its author, and that Carlyle, in his writings and throughout his life, exhibits three traits which are almost incompatible with a successful discharge of the functions of an historian. He was a dramatist; he was a sentimentalist; he was a preacher.

Of his dramatic power, as already pointed out, every page in his 'French Revolution' gives evidence. It is, as Mr. Fletcher rightly insists, a series of pictures; but then it is at bottom nothing else. It is assuredly not, in the ordinary sense of the word, a history. For real knowledge, even of the facts of the revolutionary era, we must go to better informed and to more accurate though to duller writers. Carlyle wrote too soon after the events which he narrated to write with full knowledge, and he did not possess all the information which was accessible in his day. He did not at all thoroughly investigate even the dramatic episodes in the narrating of which he delighted. His blunders about the flight to Varennes are in themselves of no special importance, but they betray a kind of carelessness almost impossible to any man imbued with an instinct for research. But Carlyle's ignorance, where it occurs, is of far less consequence than his lack of historical judgment and perspective.

"No serious historian would now devote an equal number of pages to the critical period, May 5th—July 12th, 1789, and to the actual Bastille days; twenty-five pages to the fête of the Federation, twenty-eight to the mutiny at Nancy, twenty-eight to the flight to Varennes, while giving only thirty to the whole fourteen months from the fall of Robespierre to the end of the Convention, and only one hundred to the whole period of the Terror, in the common acceptance of that word (June, 1793—July, 1794)."

And the exaggerated attention given by Carlyle to striking scenes is due far less to the mere excess of the artistic or dramatic temperament than to a second trait which betrays itself in every line that he wrote; he was essentially a sentimentalist. His admirers will, of course, repudiate this statement, and if by "sentimentalist" be meant a man who was devoted to the kind of sentiment or feeling of which Rousseau's writings afford the classical example, the term would of course be inapplicable to a writer who, throughout his career, poured scorn upon the feebler side of humanitarianism, philanthropy, and that over-cultivation of the tenderer feelings of human nature which is generally associated with the word sentimentality. But if "sentimentality" be used as meaning the tendency to be guided by feeling, by passion, or emotion, of whatever kind, rather than by the dictates of the understanding, then Carlyle assuredly may be ranked among sentimentalists. We may use of him an expression applied many years ago to an author of a very different type by one of the most brilliant of our living writers: "He abhors principles, and adores persons." He is guided, not by any settled, still less by any profound or systematic, view of human progress, but by his sentiment.

In plain truth, Carlyle has shown himself everywhere utterly wanting in anything like a philosophy of history. He hardly realized that it was the duty of an historian to trace effects to their causes, or to show, as was certainly the case, that the Revolution was the result of assignable conditions. His much talked of hero-worship was the expression of the idea that the course of events depended wholly on the action of a few leaders, who stood forth as giants towering above the herd of commonplace men. These heroes were in their turn the representatives, and sometimes (as in the case of Mirabeau and Danton) the strongest representatives, of some spiritual power. But what was the spirit and what was the inspiration which gave sovereign authority to the French Terrorists, who were for the most part a lot of sorry blackguards and cowards; which, on Carlyle's view, enabled untrained volunteers to defeat disciplined armies; which, though the mission of the spirit was to destroy

shams, gave France into the hands of rulers as incompetent as were the members of the Directory—Carlyle never makes clear to his disciples.

One thing only is certain, namely, that wherever Carlyle discerned (or thought he discerned) might, there he assumed the existence of right, and that he exhibits a strange leniency to the forms of passion or emotion which break though the conventions of every-day life. Hence, in part at any rate, the lack of that calmness which is absolutely essential for the carrying out of profitable research. Hence, too, his studied neglect of matters which are of the utmost importance. From him you will learn nothing of the development of French institutions; you will learn little, if anything, of the opinions of the men who attempted during the Revolutionary era to guide the destinies of France. You may, indeed, get from Carlyle a general impression, the truth of which is very doubtful, that the death of Mirabeau and the execution of Danton were irreparable misfortunes, which deprived France of the heroes who might, had the fates favored, have guided the ship of state into a safe port; but you will not learn from our author how much might have been done by a very little ordinary common sense and ordinary courage, not, indeed, to put an end to the Revolution, but to prevent its excesses. The "whiff of grapeshot" fired by Bonaparte, we learn, put an end to the Revolution, though it really did no such thing. We also learn that, "in old Broglie's time, this whiff of grapeshot was promised, but it could not be given then; could not have profited them." But the last words involve a gratuitous assumption which runs through the whole of Carlyle's book, and which, with Mr. Fletcher, any sensible man may well decline to accept.

Carlyle, again, cannot believe what may now be considered a well-ascertained fact, that the sympathies of the mass of Frenchmen were, throughout the Revolution, not with the Terrorists, but with the Moderates and Constitutionalists, and that it was the cowardice, not the enthusiastic patriotism, of Frenchmen which enabled a minority, consisting mainly of scoundrels, to tyrannize over Paris, and which, combined with the force of historical circumstances, made Paris, while enslaved by the Terrorists, the tyrant of France. Carlyle, on the other hand, definitely teaches that the poorer classes were better off under the Terror than ever before, though in favor of this view he affords no evidence whatever, and, in Mr. Fletcher's judgment, no evidence exists. Our historian further assumes that, in some way or other, the Reign of Terror and all the fuss and fury of the Revolution gave a deathblow to cant, while any observer who with calm eyes notes the present condition of modern Europe, and especially of modern France, will probably come to the conclusion that cruelty, rapine, and murder have not turned out to be the proper means for destroying or even diminishing the power of cant or hypocrisy, and that, though the general movement of which the Revolution in France was merely a part, has conferred some great benefits on mankind, yet the countries which have gained most by such progress as has been made since 1789 are the countries which have most carefully avoided the recklessness, the violence, the faithlessness, and the cowardice which disgraced revolutionary France.

But of Carlyle's specific errors as an historian we have said enough, and we refer students who wish for further information on the subject to Mr. Fletcher's instructive commentary. The real perplexity of a modern critic is to understand how a man of Carlyle's genius and insight came so grossly to misread as he did many of the obvious lessons of the events which he undertook to narrate. The explanation, we take it, lies in a third peculiarity of our author's character. He was, above all things, a preacher—we might almost say he was the last of the great preachers of Scotland. His book is, after all, essentially a set of sermons—very impressive sermons, we admit—on the French Revolution. The work opens with Book I., on the death of Louis XV.; the three chapters devoted to this topic form perhaps the most striking of Carlyle's prophetic utterances, but historically they are a miserable substitute for anything like an account of the conditions which produced the Revolution. The reader is edified, he is not instructed; where he looks for an introduction to the details of an important era, he finds a sermon. As the book begins, so it ends. If the death of Louis XV. is the most impressive of Carlyle's sermons, the last page or so of his last chapter contains the worst specimen we know of his prophetic rodomontade:

"Higher, higher yet, flames the Fire-Sea; crackling with new dislocated timber; hissing with leather and prunella. The metal Images are molten; the marble Images become mortar-lime; the stone Mountains sulkily explode. RESPECTABILITY, with all her collected Gigs inflamed for funeral pyre, wailing, leaves the Earth: not to return save under new Avatar."

The critic of to-day reads the passage of which the sentences cited are a mere fragment, with sheer amazement. How, he asks himself, could an author of genius and humor have written, how could men of sense have read with more or less admiration, such intolerable rant? He remembers, however, that Napoleon and his generation delighted in Ossian, that men are still living who found amusement and some kind of instruction in the writings of Christopher North, and reflects that Carlyle was not the first Scotchman to "write bombast and call it a style"; he bears in mind, too, that the power of a sermon lies in the effect which it produces on those to whom it is addressed, and that the very reason why good sermons become, after the lapse of a short time, so unreadable is, that their merit consists in their suitability for the congregation for whom they were actually preached. It is, indeed, Carlyle's temporary importance as a preacher which mainly threatens his ultimate fame as an historian. Will the artistic merit of scenes in the 'French Revolution' in the long run balance the wearisomeness of obsolete prophetic denunciation?

WEBSTERIANA.

The Letters of Daniel Webster. From Documents owned principally by the New Hampshire Historical Society. Edited by C. H. Van Tyne, Ph.D., Senior Fellow in American History, University of Pennsylvania. McClure, Phillips & Co. 1902. Pages xxii, 769.

This volume significantly supplements the two volumes of Webster's Private Correspondence published, in 1857, by his son Fletcher with too little care and scholarly scrupulousness, and with some filial suppressions—with a politic "systematic omission of unpleasant things that Webster had to say concerning Abolitionists" (for the civil war had already begun in Kansas, and that "North Star" whose dawning Webster had hailed in 1842 as "a strong, conscientious, and *united* opposition to slavery" was now clear in the heavens). The present editor, in a preface well calculated to propitiate the impartial, expressly disclaims any such softening of disreputable traits or language in his copying or in his selections.

His arrangement of his bulky matter will also, we believe, be generally approved. In each division the time order is rarely violated for the sake of grouping what relates to a given topic, but this is all resolvable in the chronological index of letters from and to Webster. More questionable is the line of demarcation by which Webster in sympathy with the opposition to the Missouri Compromise is classed as "The Local Politician," while Webster in support of the Fugitive Slave Bill is "The National Statesman." In the non-political divisions the juxtaposition of letters according to dates has sometimes a bizarre effect. Thus, under "Family Relations" (February 23, 1848), Webster's high-strung daughter Julia deplores the loss of her brother Edward, a victim by disease of the Mexican war: "I rejoice in one thing, that he was free from the blood of any man; that he did not die in battle. He went forth to a wicked and cruel war; and there he has died, like so many before him, without one friend to smooth his dying pillow." This passionate outburst is immediately followed by a note (July 25, 1852) from Webster to his daughter-in-law: "Green Harbor is not well supplied with Poultry, fit to cook to-day. Can you afford us a pair of your Boston Chickens?" Each division has a summary introduction that is helpful. There is no general index to the contents of this correspondence, which, it may be said here, is confessedly not exhaustive as regards Webster's share in it. A large unpublished private collection, which is, we infer, to figure in Little, Brown & Co.'s new edition, was not available for this.

Mr. Van Tyne's footnotes may fairly be called capricious. They might have been greatly extended, but they might also have been curtailed, for not a few are futile, like those on pages 625 and 638, which simply repeat the text. The first note on page 462 is unintelligible. Those on pages 552 and 578 should have repeated the facts, not given references. Such as identify persons mentioned in the correspondence are often singularly dislocated. One on page 600 might have been looked for at page 221. Sometimes the information is inaccurate, as when, on page 372, that is ascribed to his father which is meant for Judge E. R. Hoar; or it is insufficient, as on page 673, when B. F. Butler is simply described as "of New York." Names are occasionally misspelt, as Abbott for Abbot (p. 446), Plummer for Plumer (p. 552); and the same is true of the text—*W.* H. Grinnell for M. (p. 539), Sauger always

for Sanger (pp. 441, 466, 467, 470), Curtiss for Curtis (p. 470), March for Marsh (p. 461). Among the too numerous typographical errors, like "bandalia" for *Vandalia* (p. 458), one at least betrays the editor's youth. At page 221, when Fletcher Webster, sent to Illinois to look after his father's land speculations, writes that he has "made a short trip among the Tuckers," an older head would have known that he wrote "Suckers," the cant word of the day for Illinoisans. Years, again, would have superseded diligence in research when "Colgent's(?)" is hazarded on page 608 for Colquitt's; and if Solomon U. Downs, Senator from Louisiana in 1850, be now well forgotten even by his contemporaries, Mr. Van Tyne would have got the clew to him had he turned from the rough draft of Webster's 7th of March speech to the finished product, and would not have rested with "Mr. Doroney(?)" (p. 399).

We gladly pass from these not serious shortcomings to some consideration of the matter for which Mr. Van Tyne's industry has made us his debtor. We feel warranted in saying that nothing of importance is revealed to affect the judgment of Webster by friend or foe. We knew that he was urged in vain to attend the anti-abolition meeting in Faneuil Hall on August 21, 1835, which led exactly two months later to the "shamefully good mob" of "gentlemen of property and standing" making a scapegoat of the editor of the *Liberator*. It is something to find here (p. 196) the official invitation that was unheeded, but still unrevealed is his motive for keeping away. Less than three years later (p. 211) he could write privately of cherishing "the friendship and support of those great masses of good men who are interested in the anti-slavery cause"; but was he in 1835 anything but politic in not coming out against them? —as when, in 1814, having made a notable speech (excellent reading to-day) on Giles's militia draft bill, he wrote it out, "but, upon the most wise reflection, I have laid it up in the drawer."* In this speech one passage stands out (p. 61), denying any Constitutional authority "to take children from their parents, and parents from their children, and compel them to fight the battles of any war in which the folly or the wickedness of Government may engage it." In 1846 (p. 327) Webster outlines "guarded" resolutions for a proposed meeting in Boston:

"(1.) That the Country being in actual war, must be defended, and its rights and interest maintained, whatever opinion be sustained of the necessity of its commencement.

"(2.) That so long as the war is waged for National defence, or public rights and interests, and appears not connected with unjustifiable purposes of ambition, or desire of aggrandizement, or acquisition of the Territory of other States, by arms, the Government should be supported in carrying it on and in bringing it to a speedy and successful termination by all truly patriotic men, without distinction of Party."

This anticipation of the McKinley patriotism of 1898 was born of the Presidential ambition so sorely wounded in 1848. On June 16 of that year, with reference to supporting Taylor's nomination, he wrote to his son (p. 368): "I shall endeavor to steer my Boat with discretion." This same quality was manifested in 1850—on the eve of his swallowing the Fugitive Slave Bill whole (and in its first worst state) with the hope of gulping the Southern Whig vote for the Presidency—when he suppressed "the Bill about fugitive slaves which was in my Drawer when I made my Speech" (pp. 415, 417). Another of Mr. Van Tyne's more important finds is the heads of the 7th of March speech. The famous passage reads there (p. 397) as spoken: "I will not reaffirm an Ordinance of Nature or attempt to re-enact the Will of God." Forced by merciless catechising as to what a legislator should enact if not the will of God, he interpolated a question-begging adverb: "I would not take pains *uselessly* to reaffirm an ordinance," etc. Fillmore, the signer, almost shines by comparison with Webster, the defender, of the Fugitive Slave Law. The President could write to his Secretary of State on October 23, 1850 (p. 437): "If there be any provision in it endangering the liberty of those who are free, it should be so modified." Webster on November 16 (p. 443) could discover no "unconstitutional or alarming principles," and was for amendment or repeal only "when real and actual evil arises"—that is, after some free blacks had been kidnapped. He is shown at this time in Boston disgracefully endeavoring in person "to do something to put this business of the attempt to arrest Crafts [Craft or the Crafts, a fugitive pair worth a footnote] in better shape" (p. 440).

The tragedy of Webster's moral decline moving *pari passu* with his physical break-up—the bubble of the Presidency floating before and the spectre stalking behind—is well shown in these pages. As early as 1840, Chancellor Kent, entertaining him in New Jersey, remarked (p. 745) that at fifty-seven he "looks worn and furrowed; his belly becomes protuberant, and his eyes deep in his head. I sympathize with his condition. He has been too free a liver. He ate but little, and drank wine freely." "Lank with age," he appeared at Syracuse in 1851; "whose sluggish legs were somewhat concealed by an overshadowing abdomen, with head downcast, and arms shrivelled and dangling almost helpless by his side," while denouncing disobedience to the Fugitive Slave Law as treason, and still keeping his eye on the Presidency as the fugitive slave on the North Star. In May, 1852, he writes to his son of his canvass (p. 524):

"It seems to me, with great deference, that things are not in a good way. Nobody does anything, on our side. Notwithstanding all the 'good feeling,' results appear always adverse. . . . Really, I am tired of hearing anything upon this subject unless it is a proposition *to do something*. If any [my?] friends wish to meet to consult *for action*, I will meet with them, at any time, if not confined to my home. But I have had enough of cheering prospects and sickening results."

Already among his promoters "it is the universal sentiment—*Let not Mr. Webster make another speech*" (p. 526). Then comes, in June, the "chagrin as profound as my entire nature, and it is, that, after having performed my duty to my Southern brethren, *they had neither the courage or kindness to place me on the record of that convention*"—not one vote for President (p. 531). And the postscript: "I agree that it is time to shake hands with some folks and part, and there are others I am willing to part with without shaking hands" (p. 533); with an inclination (p. 532) "to cross the seas . . . either go abroad or go into obscurity."

Time was, as we have seen, when abolition friendship appeared worth retaining, when there was even a "cause," which was Webster's own. "My own opinion is" (January 29, 1838, p. 211), "that the anti-slavery feeling is growing stronger and stronger every day; and while we must be careful to countenance nothing which violates the Constitution or invalidates the rights of others, it is our policy, in my opinion, most clearly, not to yield the substantial truth for the sake of conciliating those whom we never can conciliate"—*i. e.*, the South. Meantime, his consuming ambition had led him to make the hopeless attempt until (June 3, 1851, p. 476) he had reached the opposite pole: "The policy of placating the Abolitionists has been long practised. It has always failed." And again (August 15, 1852, p. 537): "I did what I could to rescue the country from the consequences of their abominable politics. I disdain to seek the favor of such persons, and have no sympathy with their opinions." He had never had any, apart from calculations of personal advantage.

*This speech, at page 56, is one of Mr. Van Tyne's nuggets; but he is ominously slipshod in quoting from the letter to Ezekiel Webster to which he refers us at page 68. For the phrase we repeat above, he gives: "After the best reflection which I have been able to bestow."

Early Christianity and Paganism. By H. Donald M. Spence, D.D., Dean of Gloucester. London: Cassell & Co.; New York: E. P. Dutton & Co.

Boissier's 'La Fin du Paganisme,' with its impartial study of the declining days of Paganism, and Dill's 'The Last Century of the Western Empire,' a scholarly treatment of the same period, have established the true historic view of the great conflict between Paganism and Christianity. These books, however, present the historical side pure and simple, and are to be distinguished from the writings of the historians of the Church. In other words, there are two classes of historical works of this period which differ in that one studies events as part of the world's history in their relation to one another, placing before the reader the conditions of society as they are found to exist, while the other regards the events marking the downfall of Paganism and the victory of Christianity as indications of the intervention of the Almighty. To this latter class belongs the work under consideration, a large volume of 560 pages, written by that venerable scholar and authority on church history, Dr. H. Donald M. Spence, Dean of Gloucester. The first page of the introduction clearly defines his position. Beginning with the words of Professor Sanday in his Bampton Lectures, "If ever there was a manifestation of the supernatural, it was in the condition of things out of which arose the New Testament," he declares that "the story of the rise and progress of Christianity during the 280 years which elapsed between the ascension morning in A. D. 33 and the Peace of the Church secured by the famous Edict of Constantine, A. D. 313, may be emphatically looked upon as the story of a period on the whole permeated with the supernatural." Such an attitude is not necessarily inconsistent with scholarly accuracy and impartiality, but there is serious danger lest a Christian historian give undue prominence to events which seem to indicate the intervention of

the supernatural, and rest his argument upon the testimony of Christian writers, treating with scant consideration the testimony of pagan writers.

The history of the Christian Church may be divided into two periods, the first beginning with its foundation, A. D. 33, and continuing to the Edict of Constantine, A. D. 313, and the second from the latter date to the present time. This book considers the former period. The author relies upon the New Testament writings, on the apocryphal epistles such as those of Clement of Rome and Polycarp, on the apology of Aristides and the Shepherd of Hermas, on the writings of Justin Martyr, of Irenæus, Hippolytus, Tertullian, Origen, and Cyprian. Of Pagan writers Dr. Spence draws only from those who speak directly of the Christians, as Tacitus, Pliny, and Suetonius, but laments the little assistance obtained from non-Christian sources. Evidently he has forgotten, at the outset, that the title is 'Early Christianity and Paganism' and not 'Early Christianity,' for, as the introduction indicates, the book contains no study of Paganism or of Pagan society in its relation to Christianity. The first three chapters consider the beginning of Christianity, then identified by the Imperial Government with the Jewish religion; the career of the early Church before Nero and during his reign, when the Emperor shrewdly turned the hatred of the populace upon the Christians; and the reigns of Vespasian, Titus, and Domitian, with their alternate periods of peace and persecution. Chapters IV. and V. are assigned to St. John, Polycarp, and Ignatius of Antioch as the three great leaders of the post-Neronian period. Trajan's policy of repression and the toleration and persecution of Hadrian's reign form the subject of the sixth chapter.

The title of chapter seven is "The Revival of Paganism." By this the author means the change which took place between the beginning of the first century and the close of the second, whereby Paganism, regaining its hold on the minds and hearts of men, retained that hold so tenaciously as to cause serious opposition to the growth of the new faith. Dr. Spence recognizes as phenomena of this revival the restoration of the old worship of Rome, the deification of the emperors, the re-establishing of ancient sacerdotal corporations, the admission of foreign deities, and the philosophic teaching of the later Stoics, such as Seneca and Epictetus. The deification and apotheosis of the emperors are traced to the Roman worship of the household gods combined with the servile spirit of the people of the East, which recognized the worship of the representative of the power that subdued and governed them. The study of sacerdotal corporations is confined to a brief reference to the Arval Brotherhood, and is insignificant compared with the importance of the subject. The explanation of the fact that Christianity formed the only exception to the Roman spirit of toleration and even acceptance of strange religions is entirely inadequate. It is true that Christianity did not permit an adherent to recognize in any sense Jupiter or Mithras or Isis, and that "this stern, rigid refusal of the Christian to share in the common toleration of religions excited the bitter wrath of all the Pagan world and united all the Pagan religions against him," but it was much more than this. Its aim was the destruction of Paganism, on which the Empire rested; it was monotheistic, while Paganism was polytheistic; it condemned the very means by which the Empire had subdued the nations of the world; it declared of no account all that the Roman held most dear, so that if this religion were accepted it meant the absolute overthrow of the foundation principles of the present form of existence.

The next three chapters are assigned to Christianity under the Antonines and the numerous martyrdoms of that and the succeeding period up to the reign of Decius in 249. With the intention of giving some details of the inner life of the Church, an interesting account of the history and art of the Catacombs is interpolated. With a similar purpose much attention is given to the famous disputes on "church discipline" which mark the closing days of the second and the early part of the third century, and affected the entire catholic church. This involves notice of the rivalry of Hippolytus and Callistus, of the life and teachings of Tertullian in Carthage and of Origen at Alexandria. It is curious that, when referring to the writings of Origen, Dr. Spence has not mentioned the famous Hexapla version of the Scriptures. The history of the development of Christianity is resumed in chapter thirteen with the reign of Decius, and carried through the reigns of Diocletian and Constantine to the Edict of Milan, and finally the death of Licinius, in 323, which witnessed "the close of the long-drawn-out struggle between Christianity and Paganism."

In the last two chapters the author turns from the historical narrative to a discussion of several questions which naturally suggest themselves. The remarkable conversion of the masses to Christianity following immediately upon the Edict of Milan is attributed to the deep impression made by the conduct of the sufferers in the great Diocletian persecution. But was this really the cause? Is it not rather to be found in the breaking down of the old effete systems of government and of life which took place in the days of Diocletian and Constantine? In support of his theory, our author, with a habit of partiality, looks to the "writings and records of prominent Christians," *e. g.*, Prudentius and St. Martin. The second question recalls the famous controversy on the capture of Rome that gave rise to St. Augustine's "City of God" and the treatise of Orosius, which employed Christian dialectic to convince people that the capture of Rome was not due to the neglect of ancient rites. Dr. Spence finds the causes in the increase of the slave population, the deterioration of morals, and the increase of taxation. He might have added the general decline in the spirit and courage of the people, and with all fairness have referred to the view of some critics, such as Renan, who believe that the ascetic spirit led to the neglect of civil duties. The book closes with a series of appendices on various subjects of interest to the students of Church history, *e. g.*, The Presence of St. Peter at Rome, Early Heresies of the Church. It is written in a simple, clear style, with impartial recognition of the weaknesses of the early confessors of the faith; but it is not a discussion of Christianity and Paganism.

The forty-three illustrations are, with the exception of those of the Catacombs, of general archæological interest.

Modern Warfare, or How Our Soldiers Fight. By "Ubique." With maps, diagrams, and illustrations. Thomas Nelson & Sons. 1903.

Ubique is the motto of the Engineer Corps, the sappers, of the British army; and this fact, together with the dedication "to my nephew, Lancelot Gordon," would easily put one who is familiar with the army register upon the trail of the author of this volume. In the opening pages, under the guise of a popular account, given in conversational form, of the weapons, training methods, and organization of the several branches of the army, lies in truth a criticism of the deficiencies which were so disastrously manifested in South African operations; and this first part of the book is followed by the ampler second part, which is a spirited history of an imaginary modern second Waterloo, the evident purpose of which is to set forth the new military ideals which are growing in the British War Office, or at least among the brightest under-officers.

The basis of the historical fiction is a supposed renewal of the old feud between France and Germany, some thirty-five years after the Franco-Prussian war, and the sudden invasion of Belgium as the short road to Paris by a German force, in violation of the treaty of the five great European Powers of 1831, guaranteeing the neutrality of Belgian territory; thus necessitating England's interference. While the French armies are drawn to the Rhine frontier by the feint of the larger part of the German army, a second force of Germans, under Prince Lebenfeld, dashes upon the railroad line by way of Namur to Paris. Since the Belgian resistance is feeble and ineffective, England is compelled to hasten to the rescue, and, with Kitchener in general command of the allies, and with French, who showed talent as a cavalry leader in South Africa, assigned to conduct movements in face of the enemy, the advance troops of England are mobilized in eleven days, and set down at the ocean base of operations at Ostend. This rapidity is contrasted with the not discreditable time taken for dispatching troops to South Africa—some fourteen days. Upon the historic grounds south of Brussels, a situation chosen as well for the thoroughness with which its topography has been mapped as because of its dramatic associations, a tremendous struggle is engaged; the British, with their inferior force of 90,000 men as opposed to the nearly 200,000 of Germans, acting upon the defensive. For illustration of the three weeks' battles, there are sixteen carefully drawn maps, showing the many changes of position, from hour to hour, of the combatants, and a large number of diagrams and pictures; so that the narrative is given vivid verisimilitude, both in the engineering details and in the story. It is in respect of the skilful dispositions made by the British to hold their own till reinforcements come and the weakened assailants retreat discomfited, that the critical purpose of the book appears.

For evidence of this we may recall a few of the faults of South African opera-

tions, as set forth in the most accessible account of those campaigns, Conan Doyle's 'Great Boer War.' These are some of the latter's comments: "Better shooting, better knowledge of cover, are the main desiderata in our infantry. If a man is not a marksman, he should be cast from the army." "The officer will carry a rifle, like his men. Never again should valuable lives be exposed by the fatuous idea of giving them a different dress." "Another prejudice is the reluctance of commanding officers to split up a battery and to act with any unit less than six guns." So Doyle lays emphasis upon the English need of rapid-fire guns and of the heavy howitzers; and upon the conversion of the cavalry, with its antiquated lances and swords, into a mounted infantry armed with magazine rifles. These and more shortcomings of the activities of 1898-1900 are recognized in "Ubique's" description of the elaborate preparation and stubborn defence of the lines from Trou de Bois to Mousty, which are the scenes of the fierce struggle of those July days.

The sappers have scientifically entrenched all the important points of the field during the days when the cavalry and infantry advanced posts were holding off the enemy; and when, in the thick of combat, these fortifications are taken in reverse by the assailants, the infantry, equipped a third of them with a light pickaxe and two-thirds with a light shovel attached to their belts, make effective use of their tools to dig new rifle pits. Attached to each infantry battalion is a Maxim machine-gun, and smokeless powder is employed by all arms. The cavalry acts for the most part as mounted infantry, although several emergencies are depicted in which an old-fashioned cavalry charge is potent to complete the discomfiture of a badly discouraged assaulting column. There are no British assaults in massive columns under raking musketry fire, no random shooting, but always deliberate aim and cool self-possession by the marksman. The artillery has learned to keep its guns under cover when possible, and is powerfully efficient in both the heavy and the rapid-firing cannon. And the engineers have increased their efficiency, of which there was little unfavorable criticism in South Africa, by mounting more of their men for swift movements to hard-pressed positions where their special skill could come into play.

The Romance of My Childhood and Youth. By Mme. Edmond Adam (Juliette Lamber). D. Appleton & Co. 1902.

The first instalment of the autobiography of Mme. Adam introduces the reader to the provincial society of Chauny in Picardy at the beginning of the last century. Her people belonged to the *haute bourgeoisie*, but the behavior of the women of the family was entirely untrammelled by bourgeois conventions. Mme. Adam's great-grandmother chose her husband at the age of fourteen, married him a year later, and died at sixteen, bequeathing her determined spirit to her daughter, Pélagie Raincourt, red-haired and romantic, who, next to the writer herself, is the most interesting figure in the book. At fifteen, Pélagie, who "was in despair at remaining a maid so long," heard that a young doctor named Seron had come to practise in Chauny. "If only he has not had too commonplace an existence," thought Pélagie. Pierre Seron's history proving sufficiently romantic, Pélagie, to crown her eccentricities, rode a barebacked horse to church and was married in her dressing-gown and night-cap. "It is a merry marriage," she said. Seron served as a surgeon with Napoleon's army in Germany, while his wife suffered hardships at Chauny from the invasion of the Allies. Their child, Olympe Seron, inherited her mother's beauty and decision of character without her charm.

"Olympe Lambert," writes her daughter, "was tall, with a handsome figure like her mother's; she had an olive complexion, large velvety and luminous eyes, a charming mouth with small teeth, a delicate nose with pink nostrils, brown hair with ruddy tints in it, handsome arms and hands, and a very small foot. It was impossible to discover a more fascinating creature to look at, and one of less good-humor."

Mme. Seron chose and educated as a husband for her a friendless youth named Jean Louis Lambert (Mme. Adam prefers to spell the name Lamber, but is not consistent), and when her parents consulted Olympe, she replied: "Since you desire it, I will resign myself to it. Where you have tied the goat she will browse." "Ah! that phrase, what a rôle it played in the disputes between the Lambert and Seron families, so frequent in later years" (p. 44). The child of this unpromising marriage was Juliette Adam.

Her grandmother kidnapped the infant and refused to resign her, so that Juliette's childhood was "a long series of dramatic scenes of which I was the cause, and which occasioned my being carried off many times." Mme. Adam's memory goes back to her third birthday, and she gives a lively account of the family drama in which she was destined to figure three or four times a year during her childhood.

"They dragged me first to one side, then to the other; they kissed me with faces wet with tears, they grew very angry with one another, and they almost made me crazy by asking and repeating: 'Don't you want to come with your papa and mamma?' 'Don't you want to stay with your grandfather and grandmother?' . . . On that day, as on many subsequent days, my parents from Blérancourt yielded and grew calm."

Juliette Lambert's father was a "Socialist-Democrat," a disciple of Saint-Just, and an admirer of Louis Blanc. He took advantage of the brief visits to him which her grandmother permitted to convert Juliette to his theories.

"I am the daughter," she says, "of a man who was a sincere sectarian, disinterested even to self-sacrifice, and who dreamed of absolute liberty and absolute equality. Until the terrible year 1870, his mind mastered my own. For an instant, during the days of the Commune, he thought his dreams were about to be realized. Were he alive now, he would be a disciple of Monsieur Brisson, whose political ancestor he was. He would have pursued only one idea: the upsetting of everything."

Mme. Adam's grandfather was a stanch Imperialist; her grandmother was an ardent royalist, and when the child was six years old they all tried in turn to convert her to their own ideas. No wonder that she writes of her father: "Sometimes it seemed to me that he actually probed in my brain as with a red-hot poker, as grandmother, also, too often did. I felt great pain in my temples, and would say: 'I can't listen to you any longer; I feel ill.'"

Juliette Lambert learned Latin from a great aunt, of whose pastoral life and devotion to Virgil she gives a charming account; but it was no doubt to her father's conversations that she owed the best part of her education. Her mother was a morbidly jealous woman, who never cared for her daughter, and regarded with gloomy disdain the infatuation of the other three for the pretty, precocious Juliette. "A pedantic, unbearable child," she would say, "with her intelligence overheated at an age when it should have been set on calm foundations."

When Louis Philippe fled and the Republic was proclaimed, Lambert thought his ideals were on the eve of recognition. He was elected Mayor of Blérancourt.

"Grandmother and I went to see them plant the tree of Liberty, but it displeased us to behold my father attending this ceremony dressed in a blue blouse. His tricolored scarf was tied so as to show the red only. Already my father declared: 'Of the three colors we like only the red.' White seemed to him too Legitimist, and blue too Orleanist. 'Juliette,' asked grandmother in my ear, as we were starting for the ceremony, 'do you like that blouse? Does it not shock your taste?' 'It is partly blue, at any rate, grandmother,' I answered, laughing; 'and, with papa's ideas, it might have been all red!'"

For these republicans of 1848 Mme. Adam expresses the warmest admiration. Their exultation was shortlived, and ended with the election of Napoleon III., when the tree of liberty at Blérancourt was pulled down and Lambert narrowly escaped being exiled as a dangerous revolutionist. He wished to take part in a phalanstery founded to make trial of Fourier's doctrines, to which he was a convert, but his friends persuaded him to stay quietly at Blérancourt.

In 1850, when Juliette was not quite fourteen—

"There came one day to breakfast with my father a very advanced Republican, who was, moreover, a Comtist—a name that my father was obliged to explain to me. Our guest was a lawyer of the Court of Appeals at Paris, but lived at Soissons for the time being. His name was Monsieur Lamessine. . . . He was of the type of an Italian of the South, with very sombre eyes, a pallid complexion, lustrous blue-black curling hair."

A year later he asked for the hand of Juliette. Her grandmother favored the match, while her father wept and implored Juliette not to leave him for a man whom he considered unworthy. For months they quarrelled and raved at each other, and finally Juliette, to escape from so much violence, gave her unwilling consent to the marriage. It proved a most unhappy union, and when Juliette Lamessine's daughter was born, and her husband, having secured her dot, showed himself in his true colors, Juliette's grandmother starved herself to death rather than live to see the misery she had brought on her idolized granddaughter.

"From the day my grandmother left us, my father's one thought was to replace her in my life; . . . he encouraged me to work, and said to me, 'When your married life becomes even more intolerable to you than it is now, your mother and I will dedicate our lives to you. Work, work, and become known. There is no other way by which a woman can gain her liberty than by affirming her personality.' I worked while nursing and bringing up my daughter. Then one day, after some insignificant literary at-

tempts, revolted at the insults Proudhon had thrown at Daniel Stern and George Sand in his book, I wrote my Anti-Proudhonian ideas, and my real literary life began, with the record of which I shall some day continue these memoirs."

With these words the book ends. It is not easy to escape being tedious in a memoir of one's childhood that runs to four hundred pages. But Mme. Adam is never for a moment dull, and it is doubtful whether the record of her later life will rival in interest this romance of her youth, which ends with her marriage. The translation, which is anonymous, is admirably done, and the book is attractively got up.

Literature and Life. By W. D. Howells. Harper & Brothers.

There have been moments in Mr. Howells's long and brilliant literary career when he has been mistaken (has seemed to mistake himself) for a moralist, philanthropist, reformer, for something other if not better than a literary person—one, that is, with the literary sense so active and efficient that it generally manages to decorate his opinions and lend some sort of grace to his prejudices. In his word of explanation prefixed to 'Literature and Life' he corrects such misconception of his true character, and reveals considerable self-knowledge. "I am never quite sure of life," he says, "unless I find literature in it. Unless the thing seen reveals to me an intrinsic poetry and puts on phrases that clothe it pleasingly to the imagination, I do not much care for it." Such a frank confession should go far to modify any bitterness that kings and queens and aristocracies and millionaires may cherish towards Mr. Howells, and might even bring authors of romantic novels, historical novels, to regard him with a feeling milder than implacable hatred. For he writes about these persons, their privileges and their practices, not primarily because he despises and hates them and wishes to ruin them, but because they attract his imagination and "put on phrases."

For all imaginative writers whose work has a serious intention, who are sometimes apparently acrimonious in controversy, Mr. Howells's plea constitutes a defence. They should never be taken literally; allowance should always be made for the temptation of the phrase. The volume of casual sketches under consideration needs no defence. The subjects, with few exceptions, are not controversial, and these exceptions are of interest chiefly to the literary guild, notoriously irritable, and less than any other class (when opinions and theories are in dispute) willing to make that desirable allowance for the temptation of the phrase. Against occasional denunciation (doubtless spoken in dead earnest) of romantic and neurotic fiction, and the public that reads it, may be set a genial, indeed light, treatment of certain social conditions which Mr. Howells is supposed to abhor. At the "Horse Show" his harshest criticism of the display of wealth and fashion is that it did not come up to his preconceived notion of splendor. "I should not," he says, "have objected to the swells at the Horse Show looking dreary if they had only looked more like swells." When he is among the last of the permanent guests at a European hotel, and is pleased with the respect paid to his quality of permanency, he reflects:

"We shared the regard which all over Europe attaches to establishment, and which sometimes makes us poor Americans wish for a hereditary nobility so that we could all mirror our ancestral value in the deference of our inferiors. Where we should get our inferiors is another thing, but I suppose we could import them for the purpose if the duties were not too great under our tariff."

That sacred subject, the American language, comes in for frivolous if not disrespectful notice. Certain friendly Germans, having parted company with Mr. Howells at Scheveningen, "we were left for some meals to our own American tongue, with a brief interval of that English painter and his wife with whom we spoke our language as nearly like English as we could."

In a collection of essays and short sketches, the personality of an author is often more completely revealed than in a long work. From this volume we get a clear impression of the kind of man Mr. Howells is, and of the things that most attract his imagination and engage his sympathies. These things are recognizable by all Americans as fragments of common experience, and, as we read, we are actually living, struggling with our problems of existence, and taking our leisure and pleasure in the companionship of a wise and kindly guide, philosopher, and friend.

Aristotle's Psychology: A Treatise on the Principle of Life (*De Anima* and *Parva Naturalia*). Translated, with Introduction and Notes, by William Alexander Hammond, Assistant Professor of Ancient and Mediæval Philosophy in Cornell University. Macmillan Co. 1902. Pp. lxxxvi. + 339.

We recently called attention to the comparative neglect of Aristotle's works by the classical scholars of America. After those words were in type, we received the volume named above, by one who, though he is primarily a philosopher, has received a classical training, and dedicates his work to Professor Goodwin of Harvard University, one of the two chief leaders of classical study in this country. The translation was undertaken primarily in order to make accessible to English readers Aristotle's tracts on perception, memory, sleep, dreams, and the like—his 'Parva Naturalia'; but to these is prefixed a translation of his main work on the soul, the 'De Anima,' which is nearly as long as all the rest together, and then an Introduction of more than seventy pages, which gives a concise and generally clear statement of Aristotle's psychology, with references to the passages on which the statement is based.

The notes to the translation are brief, and almost never touch on questions of text criticism. In general the editor follows closely the text of Biehl, in the Teubner series. The translation itself is not only more accurate, but also less technical and more readable, than its predecessors, and will be found both intelligible and interesting by many who have shrunk from the perusal of Aristotle's philosophical works. Rarely does the translator modify the author's thought, as he does where Aristotle says boldly that some men never have dreams, and others only in old age, while the translator, more cautiously, says (p. 246): "It has occurred in certain instances that men have never in their lives known themselves to have a dream; in other cases they have observed them when far advanced in years, without having noticed them earlier." If Aristotle was too bold in this, he ought to be allowed to stand by his statement.

Still more rarely does the translator miss the point of a sentence as he does when his author, in speaking of the mantic element in dreams, says that if we dismiss the divine origin of dreams (as we must, for these visit not only the wise and good, but also the worthless), the reason can discern no other cause for their fatidic character, since it transcends our intelligence to discover a cause which should make certain persons foresee what is to happen at the pillars of Hercules—the extreme west—or on the Dnieper—the extreme north. Here the translation reads (p. 248), "For it seems to transcend our power of understanding to discover an explanation of the story that certain persons foretell the future through legends on the pillars of Hercules or on the Borysthenes." As so printed, the sentence interrupts Aristotle's argument.

Such slips are rare, as we have said, and the book as a whole is warmly to be commended. It should be read by all who are interested in the study of psychology.

BOOKS OF THE WEEK.

Academic Honors in Princeton University, 1748-1902. Edited by J. R. Williams. Princeton (N. J.): Published by the University.

ZOLA'S NEW NOVEL

Finished just before his death

TRUTH

12mo
$1.50
Ready next week

"What is TRUTH?" asked jesting Pilate, and would not stay for an answer.

Translated by E. A. Vizetelly. The third in the "Four Evangelists" group, following "Fruitfulness" and "Labor"

THE PLOT: Virtually, the problem presented by the famous Dreyfus case, recast in a new mould.

SUBJECT: Illustrates the antagonistic influences of the Jesuit and secular parties in modern France.

TREATMENT: Sustains from cover to cover intense interest in a vivid dramatic situation.

"Truth is on its way, and nothing can stop it."—Zola. "J'accuse."

NEW BOOKS THAT SPEAK WITH AUTHORITY

The Letters of Daniel Webster

Containing a large amount of material which prudence denied publication while any of Webster's contemporaries were still alive.

NO SERIES of letters of Daniel Webster has been so frankly edited, and therefore this single volume, practically unexpurgated, gives a true and emphatic impression of the man, with all his greatnesses and all his littlenesses. The material is admirably arranged according to Webster's various fields of activity, and not chronologically. The greater part is not published elsewhere.

Edited by C. H. Van Tyne, Ph.D. *Postpaid, $5.52. Net, $5.00*

The Great Boer War

Final and complete edition from new plates, with new maps. This will surely be the authoritative history of the war in South Africa, because it is unprejudiced and accurate. By the recognized historian of the struggle,

A. Conan Doyle *Postpaid, $2.65. Net, $2.50*

Jeanne d'Arc

The first publication in English of the complete documents of her trials. A volume absolutely indispensable to the English student of French history, and of deep interest to the general reader, for these records tell more about her character, life and habits than is known of any other historical person. *Edited by*

T. Douglas Murray *Postpaid, $5.18. Net, $5.00*

Astronomy for Everybody

A popular exposition of the wonders of the heavens. The striking quality of this book is its simplicity. Never has the science of the skies been presented so interestingly, so popularly, and yet so accurately. By America's leading authority,

Simon Newcomb, LL.D. *Postpaid, $2.15. Net, $2.00*

Dante and His Time

An important work by a distinguished German Dante scholar,

Karl Federn

The author views his character from a new point, and shows him to have been a power in the political and social as well as in literary life of his time. There is an introduction by J. H. Butler, the English Dante student.

Postpaid, $2.15
Net, $2.00

I. Charlotte Brontë, (a) Her Realism, (b) Her Attitude toward Nature, (c) Her Passion.

II. George Eliot, (a) Her Religion and Philosophy, (b) Her Art, (c) Her Sympathy: Further considered.

III. Jane Austen, (a) Her Place, (b) Her Wonderful Charm.

". . . Careful, thoughtful, sympathetic presentments . . . The chapter of Miss Austen is one of the pleasantest things yet written about her . . . the book is lovingly as well as carefully written."—*The Chicago Tribune.*

"In every way illuminative, suggestive, and interesting."—*Boston Evening Transcript.*

"An unusually valuable contribution to contemporaneous literary thought."—*New Orleans Picayune.*

". . . a skilful and scholarly, not to say scholastic review of the three greatest women in the realm of English letters."—*St. Paul Pioneer-Press*

LONGMANS, GREEN, & CO., 93 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, FEBRUARY 19, 1903.

The Week.

It is as characteristic of "leading Republican Senators" to go to the President and ask him quietly to withdraw the nomination of the negro, Dr. Crum, as it is of Mr. Roosevelt to tell them that he will do no such thing. He has met his responsibility, let them meet theirs. If they are afraid to have their constituents know that they are ready to subscribe to the new Republican doctrine that color shall be the final test of a man's fitness to hold office, that is no affair of the President's. There is the nomination: take it or leave it. It is time that the Republican party declared its position on the question of the negro's fundamental rights. Nor will the dodge of simply leaving Dr. Crum's name unacted upon until the session expires work. In that case, President Roosevelt will make a recess appointment. Why not? Is not the nominee honest, educated, competent? "Yes, Mr. President, but he is black." That reason, however, can hardly be expected to draw from the successor of Lincoln anything but a citation of Lincoln's reproachful words addressed to those who would dash from the lips of negroes the "cup of liberty."

The Paris *Temps*, commenting on the revival of oppression of the negro in this country, is fair-minded enough to admit that other nations are sharing with the United States in the "general moral slump," as regards treatment of inferior races. We really do not know of any great Power which is entitled to cast a stone at us. Even England seems about to enter upon a system of slavery—"forced labor" it is euphemistically called—in South Africa. If the great mining capitalists have their way, something of the kind will be attempted. So humane a writer as Mr. Benjamin Kidd (undoubtedly humane even with all his transcendental moonshine) allows himself to speak of the "proper place" for the blacks in the Transvaal and Orange River—that is, working like slaves for English exploiters. The plain truth is that this sudden access of contempt for inferior races, and of cool disregard of their rights, is a necessary reflex of the wave of Imperialism and conquest which has swept over the whole world within the last decade. The new movement against the negro is a direct product of the spirit engendered by our treatment of the Filipinos. When you begin disfranchising and maltreating brown skins, you pass on easily to black. We were promised that our good colonial government would react happily on government at home. The movement to deprive the negro of his political rights shows that the reaction has, indeed, set in—with a vengeance!

New discoveries of the meaning of Senatorial courtesy are being made daily. It now appears that this benign institution may extend so far as to include the passage of bills of the most far-reaching importance without discussion or debate, but with a rapidity which is fairly amazing. As everybody knows, the Senate is deadlocked on the Statehood bill. Senator Quay is, to all outward appearances, still master of the situation, and nobody seems inclined to bring on a vote to find out whether or not he has a majority to sustain him. In former days such a condition meant a blockade of legislation. Now, however, the pending measure is frequently permitted to be laid aside by general consent, while the Senate considers and passes a bill or resolution "not involving discussion," but perhaps creating a new executive department, affecting the procedure in our highest courts, or looking to the settlement of a boundary dispute between this and a foreign nation. Possibly this is the "peaceful blockade" in legislation. Undoubtedly it is attended with some dangers, but it is, in any event, a great improvement over the old system under which long-winded orators threatened even the appropriation bills in order to effect their purposes.

With the passage of the bill against rebates on Friday, anti-Trust legislation for the present session of Congress is at an end. Obviously, it is nothing but the steady demand of the President which has extorted from a reluctant Congress as much as it has finally and grudgingly granted. The result shows that he rightly interpreted the popular wish that some action be taken. But for his hearty backing by the constituencies, he could not have made Congress budge. What has been done is, of course, only a beginning. It falls far short of the President's full programme. But certain instruments have now been placed in his hands, and it is for him to make vigorous use of them. If, for example, complaints are made, as they were before the Industrial Commission, that American corporations make domestic consumers pay higher prices than foreign purchasers, it is for the new Bureau of Corporations to investigate and expose the abuse. And if it finds that the practice is permitted, if not directly encouraged, by a protective tariff, it must report that fact to the President as a guide to him in recommending remedial legislation. The President has put his hand to the plough, and cannot look back.

Attention has been so closely directed to the anti-Trust amendment of the bill to create a Department of Commerce that its main object has been practically lost to sight. Yet the new Executive Department, under direction of a vigorous head, may do much to coördinate and improve several important branches of the public service. The Steamship Inspection Service, for example, whose laxness is notorious, is to be transferred from the Treasury to the Department of Commerce, we hope to the public advantage. As for the Nelson amendment providing for publicity for corporations engaged in interstate or foreign commerce, we observe a rather comic dread of the power which it confers on the President. The information gathered is to be reported to him, and "as much thereof as the President may direct shall be made public." What a dangerous power, exclaim certain newspapers, to lodge in the hands of an unscrupulous President! The joke of all this lies in the fact that these objectors are the very ones who rushed joyfully to give the President powers compared with which those granted by the Nelson bill are a mere nothing. When in 1898 it was proposed that Congress should vote the President $50,000,000 to do with as he pleased, these critics who dread the lodging of power in the President had nothing but applause. When it was a question of our Chief Executive governing 8,000,000 of people across the seas according to his own notions of justice, again these belated opponents of a swollen Presidential prerogative saw nothing but what was fair and good and Constitutional and American. It is only when they see a possibility of his governing *them* against their will that they cry out.

Through the appointment of Mr. James R. Garfield as Commissioner of Corporations in the new Department of Commerce, the President has emphasized the character which that body already was assuming. With Mr. Cortelyou at the head, it will be, in no invidious sense, the President's personal department, through which he can work relatively unhampered by party considerations, and unrestricted by any vague obligation to continue the policy of his predecessor. Mr. Garfield, in his connection with Ohio politics, and recently as Civil Service Commissioner, has gained a reputation for steadiness, ability, and complete independence. In his hands the power of investigating corporations en-

gaged in interstate commerce is not likely either to be used recklessly or to wither for want of exercise. In adding this office and power to the Department of Commerce, Congress has very possibly put into the President's hands a serviceable weapon where it supposed it was presenting him with a broadsword of lath. Our only regret at Mr. Garfield's transfer is that it takes him from an important work for which he was admirably fitted, and in which he has been highly successful.

Contrary to all expectations, the Alaskan boundary treaty easily ran the Senate blockade, and now awaits only the appointment of three American and three British Commissioners. The first duty of this Commission is to interpret that section of the Anglo-Russian treaty of 1825 which described the boundary between Alaska and the British possessions. About the beginning of the line there is no dispute. It begins at the southern tip of Prince of Wales Island and runs north along Portland Channel. What Portland Channel was in 1825 must be settled by the Commission. There is a choice between two straits. The Anglo-Russian negotiators of 1825 supposed their task to be accomplished when they had brought the boundary line to the mainland, for they imagined that a clearly defined coast range formed a natural boundary. As a matter of fact, there is no such range for three hundred miles or so, and the Commissioners must fall back upon a clause which the original negotiators framed prudentially, but hardly expected to use —the famous clause which, in default of a mountain crest, draws the line ten marine leagues from the coast and parallel to its sinuosities. The point at issue is, What is "the coast," in the sense of the Anglo-Russian treaty? It is certain that neither of the signatories of 1825 knew in any accurate sense. Their ignorance is the opportunity of the joint Commission.

This Commission will have to decide, in cases where the ten-league line must be run, (1) if it is to be run from an arbitrary line spanning the numerous small inlets, or (2) from the beginning of territorial waters of the United States, or (3) from the heads of even the smallest inlets. It is in many ways a most complicated problem. Successive rows of islands carry the outer coast and the territorial waters of Alaska a hundred miles from the mainland, while Lynn Canal runs as far inland to the roots of the mountains. There can be no doubt that the Russians, who were chiefly interested in the seal and other fisheries, intended to claim the ownership of all the islands. Whether they meant to assert control over "the mainland strip" (which the treaty of 1825 distinguishes from "the coast"), or whether (the Canadian contention) they wished to maintain only a foothold on the mainland, the new Commission must decide. The problem is primarily a geographical one, like th equally difficult one, recently settled by British arbitration—the Argentine-Chilian boundary in the Andes. If the joint Commission agrees upon an interpretation of the treaty of 1825, there may still be something to do to get a reasonable line. Possibly, even, a supplementary arbitration may follow the judicial decision. But any fair compromise may be easily made when once the coast of Alaska shall be satisfactorily defined.

Senator Lodge's idea of "cruelty" seems to be on a sliding scale. When trying on Saturday to persuade the Senate to take up the Philippine tariff bill, he asserted that, in view of conditions in the islands, it would be "absolute cruelty" for Congress to fail to act. Thereupon Senator Foraker asked him why he had made the bill less liberal than the form in which it passed the House. The House proposed to tax the Filipinos only 25 per cent. of the Dingley rates. But Lodge's Committee took that bill and sat down quickly and wrote 50 per cent. That is to say, the tender-hearted Massachusetts Senator was willing to be 25 per cent. more cruel to our Philippine subjects than the House. Senator Foraker pressed him hard. Why could we not treat our dependent peoples decently? Why not at least come somewhere near giving them free trade? Lodge was forced to admit that, personally, he should like to be more generous, but that it would be "impossible" to get through any bill less selfish than the one he was reporting. As it turned out, he could not get even that bill through. Beet-sugar Senators rose to object to as much as the 50 per cent. of injustice which Lodge was urging, and the bill went over. Such embarrassments does a statesman meet when he undertakes to make cruelty a problem in proportion!

A weightily signed petition calls upon the Senate Committee on the Philippines to sit during the recess of Congress and take testimony as to the actual conditions in the islands. The names attached to this petition speak for themselves. They show a widespread belief among men of the highest standing and influence that everything is not as rosy in the Philippines as the Imperialistic imagination paints it. Most significant is the demand that Filipinos themselves be summoned to testify. Their careful exclusion thus far evidently impresses this host of college men as both unfair and unwise. Senator Lodge's committee may pay no attention to this petition, so representative of the university world, but its very presentation is a sign of the times which no real statesman could afford to neglect. Senator Hoar very properly called attention to the extraordinary significance of such a petition, so signed, as he presented it in the Senate.

The argument of the well-known writer, Mr. Henry Demarest Lloyd, cast an interesting light on the anthracite hearing on Monday week. Concerning non-union workmen who labor during a strike, he said that, while they were strictly within their legal rights, they violated "a moral law of the highest sanctity"—the law that "a man must do what he can to help along a necessary struggle for the elevation of his own class and of society at large." Failing in this duty, "obloquy" properly falls upon a workman, as it did upon Tories during the American Revolution. But this doctrine bristles with sheer assumptions and perilous implications. When capital forces all of us to work for the elevation of its class, will Mr. Lloyd tell us that it does well? The attempt to give a kind of religious sanction to social agitation leads to all manner of violent thought and action. Mr. Lloyd is a man of peace, and a believer in the power of reason. In this capacity, he should realize the relative meaning of words. When he says that "obloquy" is the proper penalty for the crime of working for one's self, the less intelligent strikers understand terrorism. If he is willing to admit any method of union propaganda except that of peaceful persuasion, he must be willing to admit all the methods by which violent and untrained minds express their obloquy. Is unionism to assert an intolerance which theology has long given over, maintaining that it holds in its hands the issues of life and of death?

President Baer's eloquent address before the Strike Commission on Thursday is a distinctly valuable contribution to the rapidly growing literature upon the relations of capital and labor. His indictment of the outrages and the tyrannical nature of the United Mine Workers' Union is unanswerable, while his offer of an increase of wages on a sliding scale will undoubtedly figure prominently in the findings of the Commission. He was on difficult ground when he spoke of the number of laborers and their employment. It is true that no one should have the right to prevent law-abiding employers from taking labor which presents itself, and is ready to accept the wages offered. But there is a great difference between the acceptance of such labor and importing thousands of foreigners into already over-manned mining districts where permanent and steady employment is almost unknown. President Baer was at his best in his denunciation of the law-

lessness and destructiveness of the Miners' Union, as evidenced in numberless instances during the strike. Furthermore, his demolition of the new doctrine of labor—namely, that "a man who works during a strike has no moral right to work if his work destroys the hopes and aspirations of his fellow-men"—was complete. A more un-American, undemocratic, and immoral doctrine was never promulgated.

Mr. Darrow, counsel for the United Mine Workers, practically admitted, in his argument before the Strike Commission on Friday, that violence and outrage are necessary accompaniments of a great strike. If the operators were in the place of the men, he said, they would not hesitate to resort to the boycott and intimidation and clubbing. Possibly not; but they would be criminals and enemies of society if they took to rioting and murdering, whether they said they were doing their class a sacred service or not. Mr. Darrow appealed to the Commission to bear in mind the "environment" of the strikers who became violent. That Pole who "struck James Winston on the head with a club" was only acting out his nature. The same might be said of any thief or cutthroat. It is the business of the police and courts to make a new "environment" for lawbreakers—namely, that of a prison cell. If we begin excusing "crimes of passion," where shall we stop? Mr. Darrow, however, deserves credit for his frankness in recognizing the fact that mob law is an essential part of the Mine Workers' programme.

Another proof of the sacred purpose of the United Mine Workers to struggle for "the elevation of their own class," as Mr. Lloyd puts it, is seen in the limitation of the advance in wages, which they have secured, purely to union workers in the bituminous field. In the Pittsburgh district, for example, there are 40,000 miners, and the United Mine Workers do not claim a membership of more than 15,000. Yet the benefit of higher wages is to be confined to the latter, so the union leader of the district coolly announces. This is probably a bit of union strategy, designed to compel the non-union miner to surrender his personal liberty; but what a light it throws upon the alleged altruism of the United Mine Workers! Could a Trust more selfishly clutch at a monopoly, more cruelly disregard the welfare of all outside it? When Mr. Lloyd says "class," he doubtless means all workingmen; but the union understands by it simply the monopoly of labor at which it aims.

The representatives of the labor unions who opposed at Albany last week the Hughes bill to protect National Guardsmen, came dangerously near going on record in favor of rioting and lawlessness. The bill has no other object than to make it possible for a union workman to serve in the militia of this State in defence of peace and order. Yet it was denounced as an "insult to organized labor," and as an attempt to legislate on behalf of non-union men. Throughout the hearing, the labor men took the position that the National Guard is run in the interest of the capitalists, and an uninformed listener might well have thought that the State troops have been employed simply to make successful strikes impossible. Were this so, union men would never dream of entering the militia, and the Hughes bill would be unnecessary. As a matter of fact, there is no case on record in this or any other State in which the State troops have taken one side or the other. If anything, they have shown their sympathy with the strikers, as in Waterbury recently. But their actions have everywhere been directed solely towards the preservation of order. If it is right to criticise the militia for this, it is right to criticise every police force. Logically carried out, the contention of the labor unions means anarchy pure and simple. Their utterances at Albany would give good grounds for the belief that, in their opinion, no industrial strike can succeed if the strikers cannot resort to intimidation and personal violence.

In his second paper in the *Outlook* on the subject of Addicks and Delaware, Mr. George Kennan makes some interesting revelations as to the systematic methods by which the corruptionist went about his work of buying a seat in the United States Senate. He employed a young attorney to make an investigation into the circumstances of each member of the Legislature. The questions which he desired to have answered were: Who is he? Where is he from? What is his age? Is he married or single? If married, how many children has he? Does he own any real estate, and if so, are there any mortgages on it? What is he thought to be worth? and, What are his habits and general reputation? The use Addicks made of this information is obvious. According to the cynical view of the bribe-giver, a poor man, with a large family and a mortgage on his farm, could safely be approached with direct offers of money, while a legislator differently circumstanced must be reached by more subtle means. Addicks made lavish contributions to the campaign expenses of legislative candidates, giving them every opportunity to misappropriate the funds placed in their hands, thus bringing them within his power. His system was to take advantage of weakness and adroitly to undermine character. That with all his money, method, and tenacity of evil purpose, year after year brought him nothing but failure, must ever be to the high honor of the State of Delaware.

The announcement that Mrs. Stanford is preparing to surrender her control of the affairs of Stanford University into the hands of a board of trustees will gratify friends of learning throughout the country. In founding a university in memory of Leland Stanford, jr., Senator and Mrs. Stanford did well; but Mrs. Stanford, though actuated by the best intentions, has not always been wise in her management. Her intolerance resulted two years ago in the dismissal of one professor and the resignation of a number of the strongest members of her faculty. The task of President David Starr Jordan has been peculiarly difficult. In his endeavor to perfect a *modus vivendi* between Mrs. Stanford and her faculty he has been compelled to carry water on both shoulders, and now and then to turn a pretty sharp corner. He will find the change an enormous relief; he will be able to give to the problems of university development the time and energy that he has hitherto been devoting to diplomacy; and he can now hope to engage and retain the services of the ablest teachers and investigators. In the hands of competent trustees Stanford University, with its splendid endowment, should in time fulfil the noblest aim of its founders.

All intelligent lovers of musical drama will rejoice in the decision of the Metropolitan directors by which Mr. Conried becomes manager of the opera for a term of five years. Mr. Conried comes to this work under the most favorable conditions. In Mr. Hertz he inherits an admirable conductor from Mr. Grau, while the prestige of the New York Opera House has so risen that the new manager will have no difficulty in securing the best singers. The choice of the Metropolitan directors is peculiarly acceptable, because it gives assurance that the opera will be managed, not for the display of a few great singers, but with an equal attention to all the details of stage management, to the minor parts, and to the chorus. Mr. Conried's attitude toward these important and often neglected matters is shown in the acting of his own excellent stock company at the Irving Place Theatre. He will carry these principles into his larger work. We may assume that he will no more put up with a chorus that, in German opera, sings two-word parts in German and two-line parts in Italian, than he would tolerate an amateur bandmaster as conductor of his orchestra. Building upon the foundation of financial prosperity laid by Mr. Grau, and falling heir to Mr. Grau's tact in selecting great singers, Mr. Conried has every prospect of renewing the glories of the old Metropolitan Opera House. His successful candidacy is a success for art.

THE REACTION TOWARDS SLAVERY

A Republican committee of a Republican Senate devoted Lincoln's birthday to the shutting of one more door of hope in the face of the slaves whom Lincoln freed. Dr. Crum has been pronounced unfit to hold Federal office—simply because he is a black man. It is agreed that his character is above reproach and his ability out of the common. He is the type of those "very intelligent" negroes upon whom Lincoln wished to confer the suffrage, long before his party was ready so to do, and upon whom he would, by necessary inference, have been glad to bestow office. Lincoln could not have failed to sympathize with Sumner's later position—namely, that a fit colored man in a proper office was a "constant testimony and argument" for equal rights. No wonder that our latter-day recreancy to the principles of Lincoln should have called from Archbishop Ireland in Chicago on Thursday the indignant words, "To announce that the citizen who is black must not aspire to a political life, must not approach the ballot-box, is to war against American institutions."

The two things go together. Disqualification for office means, for the negro, disfranchisement. The New York *Sun* is bold enough to speak out openly what many are saying privately. It would have the ballot taken from the black man. To have given it to him at all was, it says, a blunder. Senator Hoar tells us of a Republican colleague who goes further, and maintains that it was a mistake to have abolished slavery. That is logical, for the movement to deprive the negro of his political rights is really a movement towards reënslaving him. People talk glibly about preserving to him his "civil rights"—the right to life, liberty, and the pursuit of happiness—after his political rights are extinguished, but this is to fly in the face of history. Have we got to argue over again the Reconstruction debates of 1867? Must some new Sumner arise to tell us that "a righteous government cannot be founded on the exclusion of a race"?

Disabilities cannot be effectually removed except by conferring privileges. There is no half-way house between a slave and a citizen. Every attempt to stop short in the process of freedom is a confessed failure. Look at Catholic Emancipation in England. It began with the removal of positive stigma, of political pains and penalties inflicted upon Catholics as such; but for a long time the disqualification to hold office remained. Against that lingering injustice, humane lovers of liberty had to contend. To say that Catholics had all their civil rights, yet could not hold office, was felt to be an absurdity. "What have you done?" asked Wilberforce, whose sympathies for the oppressed knew no white or black. "You have let them out of prison, but you still compel them to wear prison garb."

Herein lies the portentous importance of Dr. Crum's case. In him the prejudice of caste strikes at his whole race. His rejection confirms Secretary Root's description of the mighty question that is soon to confront this republic. The South, with an alarming amount of aid and comfort from the North, is determined to drive colored men from office, and to rob them of the ballot. A member of a Republican Cabinet stands up before the veterans of the Union League Club and tells them that negro suffrage is a failure. No outcry follows, no protests are heard. No champion of the black man arises in Congress to make a flaming appeal to the fundamental principles of democracy, or to the memories of our heroic age. It is left for a Catholic prelate to tell these conspirators against the negro's political rights that they are striking at the heart of this nation.

Negro suffrage a failure? So, with as much evidence, is Irish suffrage in this country a failure, or German, or Polish, or Italian suffrage. But does any one propose to take the freeman's weapon—the ballot—from the men who have come to us from foreign lands? Municipal suffrage as a whole might be said to be a failure in this country. But for this are we going to disfranchise cities? That is not the democratic way. That is not the patriotic, the Christian, the truly enlightened way. If any class of the electorate is ignorant, it is our business to see that it is educated. If it is a prey to designing politicians, we must not throw up our hands, confess that trickery is too much for honesty, and call for the disfranchisement of voters whom corruptionists can debauch but whom we are too lazy to persuade. We get down to the fundamentals of democracy, in this business. "We must teach our masters to read," said Robert Lowe, when the extension of the suffrage in England was carried in 1867. That is the secret of democratic progress; of the cumulative amelioration of conditions. The reason why this country has been, as Goldwin Smith has said, a vast hopper into which all sorts of races have been poured and come out citizens of the republic, is that there has been this constant appeal to the intelligent classes to defend themselves against the ignorant and the degraded by educating and elevating them. Strip the black man of his political rights and you cut the nerve of negro education.

Yes, and why educate him at all if the natural fruits of education are to be denied him? Dr. Crum of Charleston is admitted to be an educated gentleman. He stands head and shoulders above the people of his own race. He represents the colored man who has risen, as the disfranchisers say they would like to see all negroes rise. But how can they be expected to want to rise when they see the ordinary recognition and reward of ability and character withheld from a man who has risen, simply on account of the color of his skin? We involve ourselves in all sorts of embarrassments and contradictions the moment we depart from the plain democratic principle of opportunity and a career open to talent irrespective of the accident of birth. If we will not let men freely rise, be they black or red, even if we do not thrust them back into bondage we create for them a limbo of contempt, injustice, and cruelty, which has all the horrid features of the slaveholding relation.

It is a tremendous issue that is forced upon us in this new oppression of the negro. It is big with the fate of parties and of the nation itself. It looms large on the horizon as the question which, in the next few months, will be a supreme test of the Republican party, and will show whether it has indeed turned its back upon its founders and martyrs.

THE SHIP-SUBSIDY QUESTION IN ENGLAND.

The full text of the report of the Select Committee of the House of Commons on Steamship Subsidies, now at hand, embraces some noteworthy features. The most important of these is the survey of the shipping subsidies paid by the various governments of the world. Among the witnesses examined, there were differences of opinion on the question whether Great Britain now pays more than a fair *quid pro quo* for any steamship service. Mr. Buxton Forman, representing the Post-office, thought that in some cases more than the postal value of the service was paid for carrying the mails. On the other hand, Sir Spencer Walpole, a former Secretary of the Post-office, was satisfied that full value was obtained in all cases. The Committee does not attempt to decide this question. It publishes a full statement of the mail payments, which amount to $3,676,690 per year, for the United Kingdom. Nearly half of this sum goes to the Peninsular and Oriental Company for its Indian, Australian, and Chinese service, being $1,603,800 per year. The company itself considers this sum very inadequate even for purely postal services, but continues to do the work and pays fair dividends to its shareholders. In addition to mail payments, there are admiralty subventions amounting to $378,171 altogether.

German state subsidies to steamship lines amount to $1,688,850, of which $1,200,800 goes to the North German Lloyd for Asian and Australian service. The Hamburg-American Line receives no state subsidy, but that company and the North German Lloyd together receive $315,900 from the German Post-office for carrying the mails from Hamburg and Bremen to America. The Committee thinks that an indirect subsidy is grant-

ed to German steamships by preferential railway rates on goods destined for East Africa and the Levant. The fact is noted that the North German Lloyd has more than doubled its tonnage in five years. How much of this gain is due to subsidies, direct and indirect, and how much to the "energy and enterprise of the recipient," the Committee does not attempt to decide. The North German Lloyd, like the Peninsular and Oriental Company, considers itself very inadequately paid for its Asian and Australian service.

France pays more for steamship subsidies than any other country, and gets less for her money. There was entered in her budget for 1901 no less than $8,686,137 for subsidies, for bounties on shipbuilding, and for premiums for voyages made. France pays bounties on foreign steamers of iron or steel employed by Frenchmen in ocean or international coasting trade. Two-fifths of the tonnage under payment is of this class, and one-fifth consists of sailing vessels. "All of these subsidies," says the report, "are quite out of proportion to the services rendered, and, speaking generally, it is certain that French trade has not advanced with the increased munificence of the subsidies, while French shipowners, and especially French sailing-ship owners, have unduly benefited at the expense of their country."

Japan has gone into subsidies rather recklessly in late years. In 1899 the total amount paid was $2,841,632. Since that time new lines have been subsidized to China, Korea, Australia, and Bombay, the payments on which amount to $781,978. The present aggregate of $3,623,610 would seem to be beyond the limits of reason and prudence, if not beyond the resources of the nation.

Holland has a flourishing mercantile marine, but she pays no subsidies either for construction or for navigation. Her payments for mail service are on the basis of value received. Norway pays $50,000 for mail service on the same basis, and $84,940 for "facilitating steamer communications." It is a curious fact that complaint has been made by British shipowners at Hull that Norwegian subsidies, and the low rate of wages paid to Norwegian sailors, are seriously damaging British trade.

The report tells us that the United States does not pay any general subsidies, but does pay for mail carriage in American-owned ships much more than the service could be obtained for. It first pays $15,000 per voyage (in the transatlantic service) without regard to the weights carried. Then it pays $1.60 per pound for letters and post cards, and 8 cents per pound for other mail matter, the rates paid to foreign ships being about 44 cents per pound for letters and post cards, and 4½ cents for other matter.

The fact is pointed out with some misgiving that Great Britain has fallen behind Germany in the matter of speed, and that the *Oceanic* has passed under American control with the White Star Line. The necessities of the British national prosperity, however, are inextricably bound up with the possession of a strong navy and a fast mercantile marine. Therefore, in the opinion of the Committee, speed should be a condition of all ocean mail contracts hereafter, and in some cases very high speed should be required, since such ships might be needed as carriers of the food supply of the United Kingdom in time of war.

Closely connected with the public safety also is the right of transfer of British ships to foreigners. The Committee is of the opinion that no mail or admiralty subsidy should be paid except on the condition that the ship shall not be transferred in whole or in part to foreigners without the consent of the Government—the penalty for violation of the agreement being forfeiture of the subsidy and the ship. It is pointed out that such an agreement exists between the North German Lloyd and the German Government in respect to the subsidized ships of that company.

Considerable space is given to the question of shipping "conferences," by which term is meant agreements of shipowners to maintain rates, or to advance them as against the public, or to lower them as against new competitors. Instances are cited showing that many of the evils of railway monopoly exist also in steamship traffic, and that a "long and short-haul clause" would not come amiss in certain cases. For example, goods have been taken from Amsterdam to Java via Liverpool at 20s. per ton, while the rate charged from Liverpool to Java is 30s. per ton. With some hesitation, the Committee recommends that the Government retain some control over the rates to be charged by ships running under subsidy, for "if a company merely aims at a fair and reasonable rate it ought to have no ground to fear the control; if it aims at something more, the control is obviously desirable."

The question whether foreign subsidies have had a damaging effect upon British trade is examined at some length. The conclusion is reached that British shipping has maintained its flourishing position and held its own in most places, despite subsidies paid to competitors. Between 1890 and 1902, British steam tonnage increased from 8,250,000 to 13,500,000 tons, while that of Germany rose only from 928,000 to 2,600,000. Germany's percentage of increase was greater than England's, however, because she began at a lower figure. "It is easier to increase from 1 to 2 than from 100 to 200." It is admitted that the disproportionate bounties paid by France to sailing vessels (1f. 70c. per gross ton per 1,000 miles sailed) have given them some advantage over British sailing-vessels, but it is not deemed expedient to offset this advantage by a resort to bounties, nor do British shipowners recommend such a policy. They are generally opposed to subsidies except as fair payment for services rendered. The Committee thinks, however, that a special case for subsidy exists in the need of direct communication with British East Africa. At present a transshipment has to be made at Aden. Germany has a direct line to her East African possessions, and has thereby increased her trade.

ARCHITECTS AND AMATEURS.

That watchdog of the Treasury, Mr. Cannon, on Wednesday week, gave his support to a bill to erect an office building for the House of Representatives, at a cost of $3,100,000, and to add an east wing to the Capitol at a cost of $2,500,000. Under the amendments introduced by him, the responsibility for these great constructions falls to Mr. Wood, Superintendent of the Capitol Building and Grounds. The next day, in a spirited debate on the appropriation for the recent improvements of the White House, Mr. Cannon, speaking of architects, exclaimed: "I have sometimes thought that I would gladly contribute to help raise a million dollars to assassinate large portions of them." From Mr. Cannon's unwonted liberality in the appropriation bill and from his murderous intentions towards the entire architectural profession, it might safely be inferred that Superintendent Wood, who is to have the charge of the spending of five million dollars, is no architect.

Such is notoriously the case. Mr. Wood, for years the chief clerk of the late Mr. Clarke, Architect of the Capitol, has had an honorable record in managing the business of the office. He has made himself acceptable to the Senators and Representatives. His appointment, however, was a subterfuge. Lacking all architectural training, he was obviously ineligible for the position of Architect of the Capitol. Accordingly, that post was abolished, and Mr. Wood was made Superintendent of the Capitol Building and Grounds, on the understanding that his duties were to be limited to keeping up the present building. He promptly showed his incapacity for even this modest function by having Statuary Hall smeared in imitation of colored marbles. He had begun a similar disfigurement of the dignified and historic room in which the Supreme Court sits, when he was restrained by one of the justices. Now, thanks to Mr. Cannon, it is proposed to put in Mr. Wood's hands a great building facing the Capitol, and to intrust to his ignorance the carrying out of Thomas U. Walter's plan for the east wing of the Capitol. Surely Mr. Cannon has shown most signally his contempt for the architect's profession.

We have no idea that the bill can pass in its present form. If the House shares Mr. Cannon's dislike of architects, the Senate will realize that no amateur must be allowed to touch the building —one of the most impressive in the world—which all Americans regard with a peculiar reverence and affection. Mr. Cannon's idiosyncracies may impose themselves upon the House, but the Senate will ask why, in the case of the most precious of the Government buildings, a plan utterly out of keeping with the present-day spirit of Washington is pursued. The Senate will see the inconsistency of spending vast sums upon the general improvement of the outlying park system of the Capital City, while its very heart is left to the mercy of a clerk exalted through personal and political influence to an architect's position.

It is curious in this connection to note that, whereas the Government requires special skill in a Fish Commisioner, an astronomer, a statistician, and the rest, it often exacts only good intentions of an architect. This is due to a deplorable lack of training in this respect on the part of our public men. In the debate last Thursday on the new White House offices, Congressmen Gaines and Fitzgerald indulged in all manner of cheap witticism at the expense of what is for its purpose a very sensible and satisfactory building. They did not seem to realize that the all-important thing was to maintain the historic White House intact, and to provide a temporary office for the President, pending the erection of a permanent building for the Executive and the Departments of State and Justice. The architect of the "Little White House" had at best an ungrateful task; any new structure on the President's grounds is something of a necessary evil. But Mr. McKim's solution of the immediate problem of making a habitable house and practicable offices for the President, has headed off at least one absurd plan for the enlargement of the White House, and its virtual destruction as a historic monument.

It was an architect of the Wood type, Col. Bingham of the United States Engineer Corps, late Superintendent of Public Buildings and Grounds, who for years tried to get his hands on the White House. He was an amiable person, popular in society, and influential with Congress. He had worked out for the enlarged White House a frosted-cake structure of his own planning, in which the old White House was to play the minor but honorable part of the cake. Fortunately, his plan was thwarted and the Executive Mansion preserved in its simple and beautiful proportions. Col. Bingham himself has just been transferred to a position of wider, but unarchitectural, usefulness at Buffalo. The ease with which Washington has lost an amateur architect in his case, leads to the wish that all amateur architects still surviving were army officers, and subject to transfer for the good of the service. This, we submit to Mr. Cannon, would be a worthier plan than that of allowing millions of public money to be spent by an incompetent person, or that of invoking fire and sword upon those whose only fault is that they have studied the profession of architecture before practising it.

WHO ARE THE DREAMERS?

The French Deputy, M. Jaurès, probably the most eloquent man in France, and certainly one who has the respect of all, made the other day a powerful plea for disarmament, in a speech in the Chamber. He is a Socialist, but his great oration was followed with rapt attention by members of all parties. At the close, the Government, with its vast military budget on its hands, felt compelled to attempt to dissipate the profound impression caused by M. Jaurès's description of the way in which the burdens of war, even in time of peace, were crushing to the earth the aspirations of the working classes. Accordingly, Minister Millevoye rose to say that it was only a beautiful dream which the orator had been recounting to the Chamber, and that his solution of the difficulty was purely "idealist," applicable only in the distant future.

This gave M. Jaurès an opportunity for a retort as effective as his original speech had been. "You say that my solution is chimerical. But what is yours? You come here year after year with a programme which, you say, will be sufficient to guard the country against war, and yet each year's programme eats up the one of the preceding twelvemonth. Does that look like the work of severely practical men? Does the charge of lack of finality lie in the mouths of those who shift their argument and change their estimates every year? You affirm that our proposal of disarmament can be realized only at a distant day. *Mon Dieu*, when will your plan of ever-swelling and competitive armaments come to fruition? It is an infinite series of enlarging budgets upon which you bid us enter. If anything is chimerical, it is that policy. If any men are dreamers, it is the men who advocate that course."

We refer to this acute exposure of a fallacy because the latter is one afloat not in France alone. If there is anything stamped all over with evasion and vagueness, it is the building programme of the navy in this country and in Germany at the present day. We might almost add in England. The English formula for a navy has long been the "two-nation" plan. That is, the English navy must be as strong as the combined navies of the two nations nearest it in power. But even this approach to definiteness is now being thrown over. The increasing size of other navies and the possibilities of international alliance have led some English public men—Mr. Asquith, for example—to maintain that Great Britain will not be safe unless she adopts a "three-nation" formula. That is a measurably precise, though a sufficiently disheartening, programme for the British taxpayer. But with us, and with the Germans, plans for naval increase are as shifting as the sands of the sea and conjectural as the flight of a bird.

Who can pin the advocates of a larger navy down to an exact statement of how large it ought to be? Have they a definite basis to go upon? Is there any end to the expense they would have us incur? What we object to in their attitude is its extreme indefiniteness, coupled with the assumption that they alone are exact and business-like, while every one else is a dreamer. The Emperor William hangs up in the ante-room of the Reichstag a chart showing the immense disparity between the number of German and of English battleships. Does that mean that he wants Germany to have as many as England? He knows he could not get them. His appeal is really all in the air. Herr Richter asks for a definite programme, but all he gets is a swelling phrase about Germany's future being on the sea. The battleship-building programme is certainly on the sea—lost there in the fog.

Probably if the Emperor were to tell the honest truth, he would admit that the only definite notion he had was to get as many cruisers and ironclads as he could wheedle or frighten the Reichstag into voting. Certainly that is the nearest approach to a maturely considered plan that can be discerned at Washington. A navy on a peace basis is capable of being defined. So many coaling stations are needed; so many cruisers to serve as an adjunct to the diplomatic service and to protect commerce. But when you launch out into the great unknown of a possible war, as we are asked to do, you are at once in wandering mazes lost. We are not arguing at this moment which policy is the true one for this nation. The only point we make is that the champions of a big navy do not agree among themselves; have no well-defined programme which they can defend; could not tell within $200,000,000 how much money it would take to carry out their ideas, or within fifty years when their plans will be completed. Under these circumstances, we submit that they are the real dreamers. They cherish plans which are in perpetual flux, and demand appropriations which progress in a series ending only in national bankruptcy. And these are the men who reproach the friends of peace with being idealists!

THE FUTURE OF THE DRAMA.

The theatrical outlook here and in England is so discouraging that the most ardent believers in the possibilities of the stage as an artistic, moral, and educational force, as well as a source of the best entertainment, might well despair of its future, if it were not for the occasional schemes suggested for its reform. These, as a rule, are far too vague and ill-considered to justify the expectation of practical results, but they reveal, at least, a growing feeling of contempt and disgust at the imbecility or indecency of most of the current exhibitions, and a desire for something better. Therefore they work together for good.

Most of the reformers clamor for a national or an endowed theatre of some sort to be run in accordance with their own peculiar theories. Several of them have been identified with experiments on this plan, which failed because they appealed only to a handful of enthusiasts. The plays may have been the best in the world—it is not necessary to discuss that point—but the public would have nothing to do with them. Plainly, a theatre conducted upon such lines, no matter how perfect the play or the performance, would be an absolutely futile establishment, as regards any permanent effect upon the general situation. Nor would a National Theatre, supposing that such a representative institution could be maintained in this country (which is exceedingly doubtful), be of much use, except as a show place for visitors, and a pleasant harbor of refuge for actors possessing the necessary political influence. Subsidized State or municipal theatres in all the principal cities might, under honest and capable direction—if that could be secured—help to create a demand for higher standards, but under present conditions the idea is too fantastic for serious consideration. As matters now stand, the subsidized theatres would be obliged either to enter into an alliance with the existing syndicates, or to declare war upon them. If they should adopt the first alternative, they would have no excuse for existence; if the second, they would soon be bankrupt. They might get plays, they would never get players. The syndicate managers know their business and control the actor market.

Is the case, then, hopeless? Is the theatre doomed to extinction, or to an inevitable degradation to the level of the music hall or the circus? Not by any means. But it cannot be restored to its pristine vigor or stimulated to higher development by any system of financial coddling or legislative enactment. Protection benefits art no more than it does trade, except under very rare and peculiar conditions, and then only for a season. What the theatre is suffering from to-day is the domination of the speculative and commercial managers, who, after building up a monopoly and practically putting an end to competition, have gone into the business of making reputations by advertisement, and substituting notoriety for merit as the standard of comparison in all matters connected with plays and players.

In this revolution they have been assisted to an incalculable extent by a careless, complacent, selfish, or unprincipled press. Probably it would not be much of an exaggeration to say that without this assistance the controlling syndicates could never have come into existence. Certainly they could not have attained so quickly such vast and mischievous power. This statement will not be disputed by any person conversant with the facts. It does not necessarily imply that there has been a great amount of direct bribery and corruption on the part of individuals. But any one interested in the question who will take the trouble to examine the files of newspapers published during the last decade or two, will be struck not only by the increase in the size of the theatrical advertisements, but by the much greater increase in the amount of space devoted, not to criticism, real or pretended, but to all manner of silly or scandalous gossip about players, most of which emanates from the various box-offices. This is one way, not to mention others, in which modern journalism has become the confederate of the speculative manager in his circus-like methods; and it may be taken as an axiom that one of the first essentials to theatrical reform upon a large scale is a determination on the part of the press to give to stage productions the same competent, conservative, and dignified consideration which it extends to other branches of art.

But reforms to be effectual must originate in the theatre itself, and, perhaps, the most alarming feature in the dramatic situation just now is the dearth not only of first-rate actors, but of second-rate. It is to this latter class that all our so-called stars belong, and even they have few visible successors. The same state of affairs prevails in England. A writer in a London weekly, referring to a series of performances in that city by a German stock company, dwells enthusiastically upon the extraordinary versatility displayed by every member of the organization, the constant appearance of the most noted players in subordinate parts, and the exquisitely truthful effect secured by this artistic co-operation. Such work would be impossible, he says, in England, except, perhaps, in one or two of the larger provincial theatres still possessing companies trained by the old stock system. He suggests that the excellence of the German companies may be due to the superiority of the middle-class education in that country, but it can be accounted for more simply by the continuous training in every variety of drama which the members received in the days of their apprenticeship. The standards of middle-class education in Italy are not remarkably high, but the Italian actors, as has been demonstrated in this city by the companies of Salvini, Ristori, and Duse, are as versatile as the Germans. The art of acting can be acquired only by long, laborious, and varied practice.

This can be provided only in stock companies. In them the novice is paid for his services, and therefore can serve a longer and more thorough course of apprenticeship than in a so-called school of acting in which he can learn nothing that he does not pay for. Without stock companies there will be no supply of good actors, and without them there can be no theatrical resurrection. There must be a reversion to first principles, and it may be nearer than superficial observers suspect. Our present managers, by their short-sighted policy, are killing the goose that has laid their golden eggs. They have filled their theatres and are building more, but they have stopped the production of actors and made play-writing either discreditable or hopeless. Sooner or later a financial crash is inevitable, and when it comes there will be a period of terrible trial for the profession. But that is what is needed. Nothing else will compel a revival of individual enterprise. To-day, the whole army of mummers are the placid slaves of a solvent oligarchy. Left to their own resources, they must combine or starve. But, with the dissolution of the Trusts, will come again the day of the really independent theatre. With the independent theatre will come the honest and honorable competition, in the face of that adversity which, throughout history, has been the rough but kindly foster-mother of art; and thus, and not otherwise, will the dramatist and the actor resume their Shaksperian function as the abstract and brief chronicles of the time.

CIVIL GOVERNMENT IN PORTO RICO.

February 9, 1903.

The appearance of a second annual report of a civil governor of Porto Rico under American sovereignty, and its utter failure to receive even the modicum of interest ordinarily accorded to an important Government document, emphasizes how completely that which was but recently an acute phase of national politics has become a neglected incident of national history. It is doubtful whether the position now occupied by Porto Rico in the consciousness of the American people is very different from what it was before the war with Spain. At any rate, if our acquaintance with and interest in the island and its people are greater now than then, they are of a quality to be described as potential rather than positive. We have given the island a workable instrument of government, we have sent there good men to

administer its affairs, we have been generous in permitting free trade relations with the United States and in granting exemption from the burdens of Federal taxation, and we stand ready, when occasion requires—be it German naval soundings, a devastating hurricane, or the extradition of a defaulting insular official—to convert a protecting ægis into something more real and tangible. But, having done these things, we dismiss the island from our further concern, and we incline to estimate the efficiency of its administration by the completeness with which this course of inattention can be pursued. An academic attractiveness attaches to particular phases of insular experience, as the currency policy and the financial reorganization, and the public mind has a certain recurrent interest as to whether the net result of American sovereignty has been for good or for evil. But in the main we have cheerfully forgotten Porto Rico, and we ask for nothing better than to be allowed to continue to do so.

And yet the work of establishing civil government in Porto Rico was a notable performance; and when a future historian of modern colonial experience shall review the course of events from the introduction of civil government in May 1, 1900, to the establishment of the island upon a self-supporting basis and the introduction of free trade relations with the United States on July 25, 1901, he will accord a large measure of praise to the devotion and ability of the first civil governor, Charles H. Allen, and the remarkable group of men whom President McKinley associated with him. Within a period of fifteen months three extraordinary results were attained. The military rule under which the island had groaned for more than four hundred years was replaced by civil government. A perfected system of economic exploitation yielded to a modern equitable system of revenue. Finally, the old insular isolation was modified by favorable educational and economic influences. During the second year of civil government there has been healthy and encouraging progress along these several lines. Old difficulties have been solved and new problems have arisen, often of increasing difficulty and complexity. The paradox of civilization, that an improving standard of life and a dawning social consciousness bring impatient aspiration and discontent with status, is realized in Porto Rico to the utmost.

With the retirement of Gov. Allen the efficient insular secretary, Mr. William H. Hunt, succeeded to the executive office. Similarly, with the return to academic duties of Dr. Hollander and Dr. Brumbaugh after the completion of the respective services for which office had been accepted, viz., the introduction of a revenue system and the organization of an educational department, Mr. W. F. Willoughby was appointed treasurer and Dr. S. M. Lindsay commissioner of education. The vacancy in the office of insular secretary was filled by the appointment of Mr. Charles Hartzell. Better appointments could not have been made, and yet the occasion therefor brings to mind one of the gravest problems that will confront the United States in the administration of its dependencies. Up to the present time it has been the peculiar attractiveness of a constructive period, the urgent appeal to patriotic sentiment and the extraordinary public prominence of our insular policies, that have secured the services of remarkably capable men in the administration of our dependencies. But these are transient conditions. Triumphant democracy will not permit the adequate remuneration of an insular service, and, after concentrated public opinion no longer holds the appointing power to a strict accountability, there is serious danger of a gradual deterioration in the character of appointments in Porto Rico as elsewhere. It is in crystallizing a public sentiment which will tolerate no other course, that each succeeding appointment of the right quality is at this time of all others important.

During the second year of civil government the keynote of insular politics in Porto Rico has continued to be the sharp opposition of the two local parties. The Republicans have been in legislative power, and the Federals have continued to denounce the organic act and to criticise and obstruct the insular administration. Gov. Hunt thinks that latterly the Federal party has undergone a change of heart, and notes that many of its members are even advocating a change of name and an abandonment of policies of obstruction. A definite test of this reformation is now being afforded. The Federals, abandoning their previous policy of political non-participation, went to the polls last November, and are represented in the insular Legislature now in session by an efficient minority.

The economic improvement of the island, as indicated by statistics of exports and imports, has been remarkable. For the fiscal year ending July 1, 1902, the export of sugar to the United States was $5,890,087, of cigars and cigarettes $1,570,938, as compared with $4,695,104 and $296,901, respectively, in the preceding year. The revival of the prostrate coffee industry is indicated in an exportation to foreign countries of $3,168,662 in 1901-1902, as compared with $1,674,460 in 1900-1901. The tremendous differential involved in free trade relations with the United States is reflected in a growth of total importations from that country to $10,719,444, as compared with $2,429,004 from foreign countries. As credit relations and consumers' tastes readjust themselves, a further movement in this direction may be anticipated. The development of internal trade has also been marked. "Merchants report business as better and sales as increased."

The public finances of the island are in no less encouraging condition than its private economies. The Hollander Law has more than realized the high expectations entertained of it, and public opinion in Porto Rico would consent with great reluctance, if at all, to any modification of its essential provisions. The financial system instituted under it has been found to be, Gov. Hunt notes, "sound in principle and flexible in application." The available balance of insular revenues increased during the fiscal year ending June 30, 1902, from $74,631.41 to $314,600.40, showing, as Auditor Garrison records in a characteristically lucid report, that, for that period at least, "the insular taxes and revenues have been well and closely collected, and the expenditures kept within reasonable and moderate bounds." But eternal vigilance is the price of sound financiering, and in the sharp relative decline of the excess of receipts over expenditures for the first half of the current fiscal year—$64,079.56, as compared with an excess of $239,968.99 in the preceding fiscal year—is to be found a clear admonition that should not be neglected. The fiscal ideal in Porto Rico for some years to come should be a public expenditure which will entail neither increase in the existing burden of taxation nor premature resort to public credit. To the Latin-American mind, spending and borrowing are peculiarly agreeable processes, and increased taxation and funded indebtedness constitute an easy administrative descent.

In educational lines the work so successfully inaugurated by Dr. Brumbaugh has been continued under the capable management of his successor. On February 21, 1902, the last date at which accurate statistics are obtainable, there were in activity throughout the island 876 schools, in which were enrolled 41,642 pupils under the direction of 934 teachers. This indicates an increase of more than 80 per cent. over the number of schools in operation under the Spanish régime, to say nothing of improvement in quality. Commissioner Lindsay declares "the work done under the Spanish school system is scarcely worthy to be called a school." Governor Hunt explains further that it is true there was a teacher for each school, but he often hired a substitute, not because better fitted for the work in hand, but that the tedium of mental exertion might be shifted from himself to another; or he sometimes appointed one of his older and brighter pupils to conduct the exercises, pretending to keep a general direction over the one or the other, although absent at times from the district for extended periods.

There has been marked progress in the other great reform connected with American sovereignty, namely, road construction. Under American control, 87½ miles of road have been completed. That is to say, within four years we have completed more than half as many miles of road as the Spaniards did in nearly four hundred years. This activity has been possible by reason of the $2,000,000 "customs refund" made by Congress for the benefit of Porto Rico, and reserved for permanent improvements of this kind. Governor Hunt expresses the hope that within three years the island will have a complete system of principal highways, and that thereafter, with better municipal conditions, local or municipal roads can be built which will be short and comparatively inexpensive.

It is interesting to note that Porto Rico affords an object-lesson of governmental ownership of a telegraph system, the insular Government having taken over the lines from the War Department in February, 1901. Commissioner Elliott gives an encouraging report as to its development. The number of offices for the transaction of business increased from ten on February 1, 1901, to thirty-two on July 1, 1902. Receipts have increased by an average of $2,101.67 per month between January and May, 1902, as against an average of $1,-895.03 for the same period in the year previous. It has been, and will probably remain, the policy of the insular Government to operate the system with a view to developing internal communication within the island rather than to make it immediately self-supporting and ultimately revenue-producing; but it is thought that, during the coming year, despite a further increase

in the number of offices, if allowance be made for the cost of public messages the operation of the system will entail no drain upon the insular Treasury.

The serious deficiency of political organization in Porto Rico still remains—the inefficiency of its local governments. The system which Spain established was designed to serve the political convenience of the central Government rather than to secure efficient service for the local bodies. American sovereignty, in neither its military nor early civil periods, introduced the radical reorganization that the situation demanded. In consequence, from this source proceed the largest number of difficulties that now confront the insular government. Some radical measures have been taken, as in the reduction of the grotesquely large number of municipal districts and in the central inspection of local finances; but, on the other hand, there has been what can be hardly considered as other than a premature resort to local borrowing, and an increasing aversion to any radical change from the essential features of the system now in vogue.

REBELL'S BALZAC, STENDHAL, AND MÉRIMÉE.—II.

PARIS, January 29, 1903.

In his 'Lettres à une Inconnue,' Mérimée writes: "Believe that you will never know either all the good or all the evil there is in me. I have spent my life in being praised for qualities which I have not, and in being calumniated for defects which are not mine." It is quite true that Mérimée remained a sort of problem even to his best friends. That he had real friends, who remained attached to him to the last, shows that he must have had some sterling qualities; but even to those friends something always remained hidden. He bragged of vices which he did not possess. He liked mystery, as is proved by his relations with the "Inconnue." He had a very broad mind; he liked the world, but hated its conventions and its limitations. He had a curiosity which was never quite satisfied and was always looking for new sensations.

The chapters which M. Hugues Rebell devotes to him and which form the second half of his volume on 'The Inspirers of Balzac, Stendhal, and Mérimée,' are interesting, as they show a relation between Mérimée's literary work and the incidents of his life. The grandfather of Mérimée was a lawyer of Normandy, and became the *intendant* of the Marshal de Broglie; his father was a painter and an art critic. His mother was a clever lady, imbued with the philosophical ideas of the eighteenth century. It was in her salon that young Mérimée made the acquaintance of Viollet-le-Duc, the architect, of Ampère, the writer, of Fauriel, of Henry Beyle, so well known later under the name of Stendhal. He was first taken as secretary by the Count d'Argout, and became during four years his *chef de cabinet*, when the Count d'Argout was successively Minister of the Navy, of Commerce and of the Interior. At the age of twenty-eight he had published already the 'Théâtre de Clara Gazul,' the 'Guzla,' the 'Jacquerie,' the 'Famille Carvajal,' the 'Chronique du Temps de Charles IX.' He saw the best society of his time, and his critical faculty found in it perpetual subjects of observation. His mind had an ironical turn, which was shown only in his correspondence. See, for instance, what he wrote to a friend about Madame Récamier:

"When her eyes had lost some of their beauty, she began to try conversation. Her method was so simple that it will appear coarse to you, but such methods are the best. She told you with a hushed voice, and for yourself alone, that you were the most extraordinary man of the century. Her manner of speaking was calculated. The first words of each phrase were pronounced with extraordinary vivacity, and seemed a sort of avowal forced by enthusiasm. The end of the phrase was spoken very slowly, and with a sort of shamefacedness which produced even greater effect upon the hearer's vanity."

Mérimée made the acquaintance of Madame Sand at the time when her famous quarrel with Alfred de Musset was making the greatest noise. His curiosity did not blind him. When he saw her, in men's clothes, such as she wore at the time, he was somewhat discouraged; he became even more so when she tried on him, ironical and skeptical as he was, her burning romantic phrases, speaking of Musset in such terms as these: "What have I done to the angels of heaven that they should inflict on me a lioness's love? In vain did Alfred get angry; he was but a lamb. . . . Alas! I lied to him, but say yourself if there exists a woman more sincere than I am at present." And she finally told Mérimée: "Passion is a severe gift, but it is divine. Prosper, you will see that my soul is not corrupt." Prosper did not wish to prolong his acquaintance with such a gushing person, especially as, with the exception of her fine, eloquent eyes, she had no womanly charms. When an allusion was afterwards made to Mérimée, Madame Sand said: "Don't speak to me of that man! He is a monster." Mérimée met Musset every week at a dinner which was given at the Palais Royal, at the Café de la Rotonde. The ordinary guests were Eugène Delacroix, the painter; Count Horace de Vieil-Castel; an English lawyer, Sutton Sharpe; Baron de Mareste, Stendhal, and his doctor, Koseff. Vieil-Castel gives curious details regarding these dinners in his memoirs, which are not easy to find.

It was in 1830, during a journey in Spain, that Mérimée made the acquaintance of Madame de Montijo, mother of the future Empress Eugénie. She was of Scotch origin, but had become thoroughly Spanish. She was very intimate with Marshal Narvaez; it was at her instigation that Mérimée composed his historical essay, 'Don Pèdre,' and wrote 'Carmen' (the subject of which has in our day inspired a musical composer). In 1830, the Countess of Montijo, who had become a widow, established herself in Paris with her two daughters, Paca and Eugenia (the latter born in Granada during an earthquake). Mérimée lived in intimacy with the family, spoiled the children, instructed them also. A letter written by him to Stendhal shows what was the exact nature of his relations with Madame de Montijo:

"I will take you on my return to an excellent woman of this country [Spain], who will please you by her wit and her simplicity. She is an admirable friend, but there has never been a question of anything but friendship between us. She is a very complete and very beautiful type of the Andalusian woman. She is the Countess of Montijo, formerly called Countess of Teba, of whom I have often spoken to you."

When Narvaez came back to power, the Countess of Montijo returned to Spain with her two children. It was after her departure that Mérimée met at the Count d'Argout's a very charming and cultivated person, Madame Cécile D——. She was married to the banker Gabriel D——, and was the daughter of the Count de L——. She became the inspirer of Mérimée, and he dedicated to her the book which may be considered as his masterpiece, 'Colomba,' a most original and dramatic account of Corsican manners, as well as the 'Vase Étrusque' and 'La Vénus d'Ille.' He entered the French Academy during the period of this new intimacy, which lasted no less than fifteen years and was suddenly interrupted by incidents which might as well have been left unrelated by M. Rebell. Mérimée had better also not have written what follows:

"Imagine the face you make when, after having admired for long years what you thought was a diamond, you discover that it was a mere piece of glass. . . . The result is, that I must lop from my life fifteen years, which not only are lost, but of which the memory is poison to me. I do not regret the time lost, but there are memories which were a superhuman world to me, a world to which I had access and which is now shut to me."

It seems as if the creative genius of Mérimée became exhausted during the years which he gave to a person, of brilliant wit and intellect, who inspired him with the only violent passion he ever felt in his life. His literary work came to an end: during the eighteen years which followed, he published only 'Lokis' and the 'Cosaques d'Autrefois'; as for the rest, there were only "articles and studies of a remarkably intelligent man, but you can no longer find in his writings the divine flame." He himself wrote:

"I am asked to do a lot of tiresome things which I dare not refuse. A friend wants a *tartine* for a book; a minister wants a memoir on the *Bibliothèque*. So I spend my time in doing useless things, but my great reason for not refusing point blank to do them is that I should otherwise do nothing at all. When I had an object, it was very different. I had then a great desire to please, and I worked hard to do so. Now, if I found at my feet the finest diamonds in the world, I would not stoop to pick them up, as I have nobody to whom I could offer them."

Mérimée held the post of Inspector of Historical Monuments. What would have been for many a sinecure, became to him an interesting occupation, and an occasion to show the great delicacy of his artistic sense. The reports which he made on his journeys from place to place in various parts of France are extremely valuable; they have become rare, as only a few copies were printed at the time, but they are much valued by bibliophiles as well as by architects. In his latter years, Mérimée found some interest in a correspondence with a Mademoiselle Jenny Dacquin, a governess of Boulogne, who amused herself by sending him a criticism of his 'Chronique de Charles IX.' Mérimée answered her, and many letters were exchanged before he saw his correspondent in London. Mademoiselle Dacquin became a friend of his, and nothing more. M. Rebell seems, however, to think that the limits of friendship and of a warmer sentiment become very uncertain; but I

believe that he is nearer the truth when he says that Mademoiselle Dacquin never was really more than an innocent *remplaçante* of what he had lost. Their correspondence is too ironical in many parts, too maternal and paternal in others, and too sensible generally to suggest the idea of a violent passion.

Mérimée had always kept up his correspondence with Madame de Montijo. The girl whom he had seen so familiarly in his youth had become Empress of the French; she offered him the post of private secretary, but he refused it, and was named Senator. "They say," writes Mérimée to the Countess of Montijo, "that the Empress kissed her husband with effusion when he reported to her what he had done. This little detail, I assure you, gives me more pleasure than the thing itself, to which I am not yet perfectly reconciled." Mérimée never took any part in politics. He gave many notes to Napoleon III. when the Emperor had the fancy to write his 'Life of Cæsar.' He was an intimate guest of the sovereign, but discussed with him only historical questions. He was at heart a skeptic in political matters; he had no belief in formulas. He knew many men and many countries, and what was good for England did not always seem to him good for France, Italy, or Spain.

His end was painful. He became very ill in the latter days of the Empire, and the war of 1870, which he had long foreseen, was a terrible blow to him. After the first defeat, he lost all hope; on the 21st of August, he wrote to his old friend Panizzi: "*Finis Galliæ.* We have brave soldiers, but no general. I see nothing but folly around me. The Chambers, which are to meet, will do nothing but help the Prussians. I expect in a week to hear the proclamation of the Republic, and in a fortnight to see the Prussians. I assure you that I envy those who have just been killed near the Rhine." After Sedan, he was a witness of the Revolution of the 4th of September; he left Paris for Cannes, where he died on the 24th of September.

Correspondence.

THE AMBUSHING OF BRADDOCK.

To the Editor of The Nation:

Sir: Noting in your issue of February 5 (p. 117, col. 3, lines 2-5) the sentence, "Occasionally there is a slip, as where the old charge that Braddock 'walked into an ambush' is given another lease of life," may I ask if this correction rests on new contemporary accounts discovered within the last fifteen years, or a fresh analysis of the old? The current view was accepted without question, after a reëxamination of the accessible evidence, both by Parkman ('Montcalm and Wolfe') and by Winsor ('Narrative and Critical History,' v., 497-8, where he repeats the word "ambush" twice); and I confess to being among the darkened with them, but more than glad to learn new truth on any subject. I am sure many other readers must be equally glad of information.

Very respectfully, F. M.

February 8, 1903.

[Parkman's words are: "Braddock has been charged with marching blindly into an ambuscade; but it was not so. There was no ambuscade; and had there been one, he would have found it. It is true that he did not reconnoitre the woods very far in advance of the head of the column; yet, with this exception, he made elaborate dispositions to prevent surprise" (*Montcalm and Wolfe*, i., 214). Winsor's only reference is as follows: "They [the French] knew from scouts that Braddock was approaching, and Beaujeu was sent out with over 600 Indians and 300 French, to ambush the adventurous Briton" (*Narr. and Crit. History*, v., 497). Winsor's account is very brief as compared with Parkman's, but gives no other support than as above to the ambush theory.—Ed. Nation.]

WILSON'S HISTORY AND ITS ILLUSTRATIONS.

To the Editor of The Nation:

Sir: I trust you will do me the honor to present this letter to the writer of the review of President Wilson's 'History of the American People,' in your issue of the 5th inst. (p. 117). It is evident that he has misunderstood my connection with the illustrations of the work, and, to an unwary reader, it might appear that the inclusion of "fancy pictures" and the use of the inscription "from an old print" should be charged to my account. This is in no wise the case. I had almost nothing to do with the selection of the illustrations, but prepared the full "Notes to the Illustrations" of Volume I., and about eighty full notes in Volume II.—nothing more.

Yours very sincerely,

Victor H. Paltsits.

Lenox Library Building, New York, February 6, 1903.

[Volume i., p. xxvi., contains this note: "For the verification of the documents and the illustrative material here, and for the notes on their sources, we are indebted to Mr. Victor H. Paltsits, . . . whose scholarly researches made possible so full a list." The language is not very clear, but was taken to mean that Mr. Paltsits had a share in the selection of the illustrations, besides being responsible for the annotations. We regret that any injustice should unintentionally have been done him.—Ed. Nation.]

CARLYLE'S FRENCH REVOLUTION.

To the Editor of The Nation:

Sir: Apropos of the admirable review of Fletcher's recent edition of Carlyle's 'French Revolution,' in the last number of the *Nation*, following as it does so closely upon a notice of the new Macmillan edition of FitzGerald's Writings, in the same number, it may not be amiss to cite the following, from FitzGerald's letter to Allen of July 25, 1840:

"I hear Spedding has written a Review of Carlyle's Revolution in the *Edinburgh*. I don't know a book more certain to evaporate away from posterity than that, except it be supported by his other works. Parts may perhaps be found two hundred years hence and translated into Erse by some inverted Macpherson."

Few literary prophecies can show more complete justification than this, sixty odd years after utterance.

Alfred L. Ripley.

Andover, Mass., February 14, 1903.

Notes.

The one-hundredth anniversary of the birth of Emerson will be celebrated by Houghton, Mifflin & Co. with a centenary edition of his Complete Works, printed from new Caslon type, with an introduction by Edward Waldo Emerson, and notes (an innovation for Emerson's publications) from the same hand. Two volumes, possibly, may be filled with unpublished material from the Emerson papers; but these will follow the reprint at a date later than May 25. There will also be a parallel autograph centenary edition, limited and numbered, and each set will contain an original sheet of Emerson's manuscript.

Baker & Taylor Co. announce "The Story of the Churches," brief volumes designed to answer the general question, "What is a Baptist?" etc.; 'Leavening the Nation: The Story of American Home Missions,' by Dr. Joseph B. Clark; 'God and Music,' by the Rev. John Harrington Edwards; 'Social Ethics,' by Prof. J. M. Coleman; and 'Reciprocity,' by Prof. J. Laurence Laughlin and H. Parker Willis.

Charles Scribner's Sons announce the early publication of 'The Principles of Money,' by Prof. J. L. Laughlin.

'Variations in Animals and Plants,' by Dr. H. M. Vernon, of Oxford, will be published this month by Henry Holt & Co.

A. S. Barnes & Co. will shortly issue 'The Real Benedict Arnold,' by Charles Burr Todd, author of 'The Real Aaron Burr.'

A very becoming Memorial of the late Archbishop Corrigan, of simple elegance in bookish attire, and free from extravagance in the biographical sketch contributed by Dr. J. A. Mooney, has been brought out by the Cathedral Library Association in this city. It comprises further an account of the obsequies, Bishop McQuaid's sermon, and the varied testimonials of the Catholic laity and the press. The impression of sweetness and integrity made by all these documents is confirmed by the numerous portraits of the lamented prelate.

Dodd, Mead & Co.'s 'New International Encyclopædia' has now advanced with its sixth volume to "Ether." In these later volumes there is undoubtedly at many points a marked improvement over those which we reviewed some time ago. This holds especially of the sub-editing and proof-reading. Though not yet immaculate in these regards, the Encyclopædia is no longer so irritating to read or such a trap for the unwary. But, with all this, much remains to be done in other directions. The illustrations are still beautiful but inefficient; the bibliographies, though better, could be greatly improved, and the assignment of space is still eccentric. The department of biography remains perhaps the poorest, unless that preëminence be disputed by the writer on characters in literature; the crudity of these is unabated. Yet it is clear that the editors must have taken

the condition of the first volumes to heart and labored at their task. In volume six the fates, too, have been good to them. An encyclopædia with such articles as it includes on Egypt and England—especially an admirable sketch of English literature—cannot be finally sneered at. Also, on natural science and art it now plainly can be consulted with general safety.

In 'Twenty-six Historic Ships' (G. P. Putnam's Sons), Mr. Frederic S. Hill, who served with distinction as volunteer lieutenant in the navy during the civil war, has given the stories of certain American men-of-war, from the *Alfred* in 1776, with John Paul Jones as her first lieutenant, to the *Oregon* in 1898. The ship's name, in each case, serves as the thread upon which are strung accounts of naval actions, histories of successive ships bearing the same name, sketches of eminent naval commanders, reflections on naval policy—anything, in short, which seemed to the writer germane to the subject under the most elastic interpretation. The book is excellently got up; the author's style is simple and pleasing; the stories themselves of perennial interest. It is in telling of the actions during the civil war that Mr. Hill is at his best, for he was a participant in several of them. Careless proof-reading is, presumably, responsible for a number of curious statements; among them, that the *Louisiana's* "bottom was twenty-two inches thick before plating with 500 tons of three-inch railroad iron." The last picture, "Naval Heroes of Santiago," by the way, is misleading, since portraits of Higginson and Chadwick, who were not in the famous battle, are given, and those of Taylor and Cook, who were in it, are omitted.

So charming a series of Egyptian pictures as Mr. R. T. Kelly has given in his 'Egypt Painted and Described' (London: Adam & Charles Black; New York: Macmillan), we have never seen before. At every point, except the process reproduction, which will not stand close inspection, they are utterly delightful. With the seventy-five, all phases of the country are covered—Cairo scenes in glows of color and costume; Nile scenes in exquisite atmosphere effects; at the cataracts and among the temples; by the pyramids; in the desert; among the fellahin in the Delta; on the sea front at Damietta. Through the land for years Mr. Kelly went, an artist at large, and gathered in the rich harvest here suggested. The people, too, he learned to know as well as the country, and, in consequence, has picked up wonderful bits of defiant realism which the ordinary Orientalist will find hard to assimilate. What, for example, are we to make of a Moslem district where the portrait of the Sheykh, just painted, is carried in triumph and hung in the mosque? The idea makes the canonist's hair stand up, but such things, evidently, can happen. And the book is full of similar scraps of strangeness. Mr. Kelly, apparently, found nothing theologically unseemly in this picture episode, and, in another place, he tells us that something is forbidden in the Koran of which the Koran never dreamed. His mind, therefore, was absolutely clear for impressions; they came to him richly, and he has booked them picturesquely and faithfully here. Yet, in curious contrast to his keenness of eye and general alertness, is a phenomenal carelessness for the representation of language. Arabic he evidently picked up colloquially and from all classes—donkey boys to desert Sheykhs—and it, as given in this book, is Arabic of the most weird, broken to unintelligibility. But that only adds another touch to the fresh realism, and a book so absolutely fresh as this on an almost threadbare subject seldom appears. Mr. Kelly must give us some more pictures and details of the *vie intime* of the Egyptians; the more *intime* the better.

The two large volumes of 'Parliament, Past and Present,' by Arnold Wright and Philip Smith (London: Hutchinson & Co.; New York: Dutton), are history of an eminently popular sort, liberally provided with anecdote and adorned by some three hundred illustrations, some colored. The pictorial record would be far more valuable if the source of the various portraits and views were always given. It is a work that will entertain for occasional reading any one interested in parliamentary history, if it does not add to his enlightenment; and for general readers whose instinct warns them against special treatises, it will be a mine of reasonably accurate information about the buildings Parliament has occupied, about the procedure of legislation and state trials, and concerning famous party whips, premiers, speakers, and debaters. All this is sufficiently diluted to serve as the daily food of political human nature of the amateur sort, and with this understanding the book may safely be commended.

Nearly twenty years ago M. Paul Bourget spent a few weeks in Oxford, and expressed some of his reveries and meditations in a publication which tells us scarcely less about M. Bourget than about the university city. A translation of 'Some Impressions of Oxford' has just appeared (London: Howard Wilford Bell), illustrated by fourteen delightful drawings by E. H. New. The chief value of the book is in these pictures. The translation is not well done. The annual subscription to the Union Society, for instance, is not a "rate" (p. 45), and the reading-rooms of that club are not used for different kinds of "lectures," in the English sense of that word.

The same publisher has issued a very much better piece of work in the form of a reprint of a paper on "University Magazines and their Makers," read by H. C. Marillier before the "Sette of Odd Volumes." It is an admirable sketch of the history of college journalism—mainly consisting of lighter verse—at Oxford and Cambridge, with sufficient quotations to whet one's appetite for a study of the "sources." Among the best-known names connected with this history are those of Thackeray (the author of a skit on Tennyson's prize-poem "Timbuctoo"), C. S. Calverley, William Morris, Sir George Trevelyan, H. R. Haweis, and, in more recent times, J. K. Stephen, A. D. Godley, A. T. Quiller-Couch, Owen Seaman, G. W. Steevens, and Barry Pain. It appears that English college wits are generally most successful in parody, of which form of literary art several brilliant instances are given in this little volume. It is a pity that Mr. Godley's delightful verses on the Rhodes scholarships came too late for inclusion. The book contains as an appendix a complete chronological list of college publications, with the names of their chief contributors.

A lecture on 'The Rise of the Experimental Method in Oxford,' by Prof. Clifford Allbutt, M.D., F.R.S. (Henry Frowde), is Oxfordy in the bad way—wordy, perfunctory, confused in the extreme, presenting nothing new in matter or form, often inaccurate, and, where right, relying on inferior authorities.

A booklet of ninety-seven pages, translated from an article in an Italian periodical, but which should not be confounded with the official Report of the Italian *Polar Star* expedition shortly to appear, has been published by Howard Wilford Bell (London). It has the not altogether happy title, invented by the English publisher, of 'Farther North than Nansen,' and is illustrated by a few rather inferior half-tones. It forms a preliminary announcement of the chief events and discoveries of the expedition of which the revised, amplified, and fully illustrated account will appear in the Report. The translation, while not idiomatic, is sufficiently accurate, and the tone of the narrative admirably modest. The expedition wintered at Teplitz Bay, where the vessel had a narrow escape from being crushed in the ice, and the party were obliged to set up tents on the shore, in which they spent the winter. In February, an attempt was made at a sledge journey northward, which proved abortive. On the 11th of March, a second party set out with the intention of sending back detachments at intervals, leaving four men under Commander Cagni for the last supreme effort northward. The difficulties proved great, as usual in attempts to traverse the pack-ice. The first detachment, composed of Lieut. Querini and two men, left the advance March 20, but nothing has ever been heard of them since, and they doubtless perished. Cardenti, with the second detachment, reached the camp in safety April 18. Cagni pressed on with great courage and energy, and on the 25th of April reached latitude 86° 33′ 49″ in about east longitude 64° 30′. After severe struggles, he and his men reached Teplitz Bay, June 23. The *Polar Star* was laboriously freed from the ice, and reached Hammerfest on the 5th of September. The geographical results of the expedition were chiefly the determination of the mythical character of some of the supposed islands north of the Franz Josef group, and the correction in detail of the existing charts. The enumeration of the scientific observations must be deferred until the publication of the final Report.

'Precious Stones: A Book of Reference for Jewellers,' by W. R. Cattelle (Philadelphia: J. B. Lippincott Co.), is designed to give all the necessary information about gems. There are chapters treating in an elementary manner the general physical properties (specific gravity, cleavage, hardness, etc.), the desirable qualities, methods of cutting, prices, modes of discrimination, history of celebrated stones, etc., with special descriptive chapters for the principal gems. The book, which is illustrated with ten plates, abounds in practical hints, and should be useful both to jewellers and to the general reader.

Prof. Henry A. Miers of Oxford, in 'Mineralogy: An Introduction to the Scientific Study of Minerals' (Macmillan), has produced a thorough text-book of the essential characters of minerals, omitting any extended mention of their mode of occur-

rence, geological distribution, origin, alteration, etc., which the author prefers to treat separately. Part I. includes the geometric properties (Crystallography), optical and physical properties (Crystal Physics), with specific chapters on the practical measurement and optical determination of crystals, and others on the general physical and chemical properties, the relations between these and the methods of description and determination. Part II. describes the more important mineral species in detail, with brief mention of well-known occurrences. Tables of the principal properties are added. The typography is excellent, and the figures of crystals sharp and clear. An unusual feature is the employment, in the descriptive portion, of shaded drawings of mineral specimens and groups which are wonderfully effective.

On June 1 will issue from the University of Chicago Press the first number of *Modern Philology*, "a quarterly journal devoted to research in the modern languages and literatures." It will appear regularly, and make a volume of about 600 pages, under the editorial conduct of Philip Schuyler Allen (manager), Frederic Ives Carpenter (English), Camillo von Klenze (German), and Thomas Atkinson Jenkins (Romance). An advisory board includes Professors Kittredge, Bright, Thomas, von Jagemann, Warren, Matzke, Hempl, and Gummere. The coöperation of all scholars in America and Europe is solicited.

Practically the entire double number, 1 and 2, of the *Zeitschrift* of the German Palestine Society (vol. xxv.) is devoted to a discussion of the climatology and meteorology of the Holy Land from the pen of Dr. H. Hilderscheid. The article, besides furnishing complete data collected for decades, not only in Jerusalem, but in other parts of the country, is also historical, and discusses fully the information to be gained from the Scriptures and the Talmud. It is accompanied by four excellent charts and one meteorological map. Of timely interest are the concluding sections, in which the author discusses the old problem as to material climatic changes in Palestine, and reaches the conclusion that there is no evidence to this effect; least of all, proofs that there ever has been a general destruction of forests which changed Palestine from a land flowing with milk and honey, supporting some six millions in the time of David and Solomon, to a comparatively dreary waste that now can scarcely sustain half a million. The best historic data go to show that there never was an abundance of forests in Palestine. Hilderscheid, accordingly, agrees with Conder and others in holding that political causes alone have produced the present deplorable conditions, and points to the success of the German Temple Society colonies as proof that the projects of the Zionists to reëstablish the Jewish nationality on the historic soil of the fathers is not a visionary dream, so far as the capacity of the country again to support a large population is concerned.

For the first time in the history of German universities a common agreement has been reached in the various states of the Empire regulating promotion to the degree of doctor of philosophy. Hitherto each school has done in this matter what seemed good in its own eyes. The Prussian Cultus Minister has now published an agreement according to which, beginning with the new academic year, the minimum requirements shall be that the candidate must be the graduate of a nine-years' secondary school, and must have been in attendance at the university for three years. Promotion is permitted only on the basis of a printed dissertation, supplemented by an oral examination. Exceptions to these rules are to be discouraged, and granted only if the authorities are satisfied with the preparation of the applicant. Only the following four grades will appear on the diplomas, viz., "rite," "cum laude," "magna cum laude," and "summa cum laude."

The "census" of Japan, heretofore taken annually from 1872 to 1900, has been rather in the nature of an enumeration. The publication of the rough results with the Résumé Statistique, annually issued since 1886, has heretofore sufficed the purpose of the Government. No enumeration has been published since 1900, and this probably because it has been recently decreed that, hereafter, a census on modern principles and with scientific thoroughness is to be taken every five years. Meanwhile the Imperial Cabinet has issued a printed document of folio size (pp. 400) in French text, with Chinese and Arabic numerals, showing the movement of the population for 1899. The statistics of birth, marriage, and divorce are elaborately tabulated, showing, for example, not only the sex of the stillborn and the normally born, but also the details, by sex and age, of the Japanese at home in the various cities, districts, and villages, and even in some foreign countries. The data in regard to marriage and divorce are very full as to sex, age, and cause. Other tables concern naturalization, loss of nationality, prolonged absence, foundlings, and some minor details.

On every New Year's Day, the daily newspapers in the large cities of Japan vie with each other not only in the bulk of their issues, comprising between ten and fifty-two pages of printed matter, but also in reproductions in color of pictures by famous artists, artistic designs, or original drawings, some of which are exquisite works of art. This year, in addition to its usual chromograph, the *Nichi-nichi Shimbun* issues a map of Tokio, covering six square feet, which most accurately represents the new features of the modern city. The boundaries of the Fu, or municipality proper, and of the various wards, the Shiro or castle enclosure, the business and residence portions, Government reservations, Buddhist and Shinto temples, Christian churches, barracks, parks, parade grounds, school property, etc., are clearly delineated. The course of the great railways entering from the south, north, and east, and of the tram or horse-cars, canals and water courses, the hills and rising ground, ponds, the great reclamations of land in the shallow bay at the mouth of the Sumida River, both proposed and accomplished, are also shown, together with the half-dozen insular curiosities out in the bay opposite Shinagawa —forts hastily thrown up at the time of Perry's visit in 1853. The execution and accuracy of the map are alike creditable, and its publication is a boon, since perhaps nothing of the sort has been issued since the publication, in 1874, by one of the American professors in the Imperial University, of the "Map of Tokio, with Notes Historical and Explanatory." It is almost startling to compare the modern and true national capital with that of Yedo, the great camp of wooden tents of a feudal suzerain, with his vassals, and the headquarters of an ecclesiastical oligarchy, exhibiting a curious union of State and Church. The maps of forty years ago show that about one-fourth of the total area was occupied by the feudal caravansaries, and fully another fourth was held as temple property, chiefly for the benefit of the priests and monks. This real estate represented the accumulation of centuries, during which Buddhism basked in the patronage of the Tokugawas. Nearly all this Buddhist property, excepting areas actually required for the sacred edifices, long since sequestrated by the Government, has served for educational and other public purposes. The map tells eloquently a grand story of progress.

—To reach the present point of progress of the new series of the Index Catalogue of the Library of the Surgeon-General's Office, U. S. A., the old series required but six volumes, whereas the volume Hernia-Inquiry, lately issued from the Government Printing Office, is numbered seven. Some idea of the reasons for this can be got from a comparison in the case of a relatively recent topic. Hypnotism in 1885 demanded but two and a half pages; now twenty-five are needed to keep up with the literature of the subject. With Immunity the growth in the same period is from a dozen lines to ten pages. But the same holds good even of the older bibliography; Hippocrates, for example, filling eighteen pages now as against ten formerly. Steadily goes forward the great task of making this library historically complete and unrivalled by the purchase of the earliest editions of medical writers. We will cite but one, Hock der Brackenau's 'Mentagra,' a tractate "de cura morbi Gallici (vulgo malafrancosz)," as the Strassburg edition of 1514 expresses it, "sive, ut Galli dicunt, Neapolitani," as the Lyons edition of 1529 insinuates—each country shifting upon another the odium of the disease. Hernia has 75 out of the 1,000 pages of this volume, and other voluminous rubrics are Hydrotherapy 15, Hydrophobia 25, Influenza 39, Infants 64, Hospitals 128, and Hygiene (by countries) 164. Homœopathy has 38 pages, against 25 in the old series, yet the difference seems, at a hasty glance, due rather to the acquisition of oldish books on the subject than to an expansion of the doctrine and the practice. However, we observe a third edition of 'L'Omopatía' in Naples in 1895. One may expect to find anything in this collection, from a report on kitchens to the House of Commons, to a Zoo in which the Hippopotamus furnishes one item, Hogs 5 pages, and Horses 14, while there is a Russian report of the commission on disinfecting cattle-plague hides. A discussion of early imprints is to be found in the note to Hugo Senensis's 'Expositio,' on page 460.

—Heilprin's 'Mont Pelée and the Tragedy of Martinique' (Lippincott) is the most thorough account of the Antillean eruptions of last year that has yet appeared. It is the work of a trained scientific observer who visited Martinique twice, and who, on his second excursion, was a close witness of some of the later violent eruptions of Pelée. The book is indeed one of the best descriptions that we possess of an active

episode in the long life of a volcano, and is freely illustrated. The most remarkable feature of the May eruption was without doubt the singularly narrow limitation of the volcanic blast of burning-hot gases by the valley that directed them toward St. Pierre, where 30,000 persons were burned to death within five minutes. The subsequent destruction of Morne Rouge in August is fully described from notes made by Professor Heilprin at the time. On the afternoon of August 29, the diameter of the eruptive column of dust and bomb-laden steam was estimated at 1500 feet as it rose over the crest of the crater; its velocity of ascent at from one and a half to two miles a minute. Its summit was lost in the great leaden umbrella cloud that overspread the sky. Bombs af lava fell near the author and his companion; one hardly smaller than a flour barrel landed within ten feet of them, spattering them with mud from head to foot. It was on the night following this close contact with the volcano that a burning hot blast, similar to the one that had destroyed St. Pierre, but now turned in another direction, devastated Morne Rouge and Ajoupa-Bouillon: houses were laid flat on the ground, trees were overturned, boards were penetrated by other boards that had been shot through them. The people were fearfully burned, and the few survivors were suffering terribly when Professor Heilprin visited the ruins of the villages the next morning. Readers of this interesting book will unite in congratulating its author on his fortunate escape from the fury of Pelée.

—Kennan's 'Tragedy of Pelée' (Outlook Co.) is a vivid personal narrative by a trained although unscientific observer. It is for the most part a straightforward account of what was seen around the volcano, or of what was learned from those who had been present at the eruption; it is entertaining in a high degree, except for certain too realistic descriptions of decaying human bodies in the ruins about St. Pierre. Several of the plates give excellent illustration of the barren ash-covered slopes of the volcano, and of the new ravines worn in ashes by the torrential rains. It seems to be well proved that the destruction of St. Pierre was not caused by flaming gases, as stated in some of the earlier accounts, but mainly by superheated steam rushing down from the mountain with overwhelming velocity. A good account is given in chapter viii. of some explosions in the valley of Rivière Blanche, when streams of water from higher up the mountain made their way down into masses of hot ashes; explosions of this kind being among the most notable secondary features of the volcano's activity.

—Of books about New York there promises in time to be a surfeit. Among the latest, the Burrows Brothers Company (Cleveland) publish Charles Wolley's 'A Two Years' Journal in New York, and Part of its Territories in America'—a reprint from the original edition of 1701, limited to 250 copies. Prof. Edward Gaylord Bourne furnishes an introduction and notes. Very little is known of the author of this brochure, but the description of the New York of 1678-80 must have been very entertaining in its time—and, indeed, is so still—from its quaint style. At this period New York was a little trading town of 3,500 people, with a commercial marine of about 1,500 tons. Trade was fostered by protection, slavery, and the practice of cheating the Indians out of their property after they had been made drunk—not an agreeable community, according to our notions. Probably the only tolerable life was among those who, like Mr. Wolley, were sent out by England to help govern it, and the higher class of merchants. Later on, as appears in the pages of 'New York: Old and New; Its Story, Streets, and Landmarks,' by Rufus Rockwell Wilson (Philadelphia: Lippincott), the practice of burning negroes at the stake was not unknown, and trade and commerce were further fostered by piracy. It is not our fault if the early annals of New York seem mainly what they seemed to Diedrich Knickerbocker—a fit subject for satire, and otherwise not an important chapter in the history of the New World. According to Mr. Wilson's "foreword," the object of his book is to bring the subject "within the reach of the busy reader of slender purse." The first of his two volumes is historical, the second descriptive; but the work is not very well written, and there is too much of it for a handbook. There are a good many illustrations.

—There is much more that is valuable in 'Social New York under the Georges, 1714-1776,' by Esther Singleton (D. Appleton & Co.). This makes us acquainted, in considerable detail, with the "Houses, Streets, and Country Homes, . . . Fashions, Furniture, China, Plate, and Manners" of the period. Of course, New York under the Georges was half-English and half-Dutch—Dutch customs lingering on down to our own time; but the American city was beginning. The author's object is to show how the prosperous class lived—"the opulent and fashionable life that revolved around Fort George." By this time luxury had made considerable progress; and this volume, with its innumerable illustrations, gives a very good view of what the author wishes to show us. The materials have been gathered from many sources—old letters and diaries, wills and inventories, newspapers, "the publications of Messrs. Zenger, Gaine, Holt, Parker, and Rivington." The volume is a provincial museum, not to be neglected by any one who cares for history, for art, or the immediate past out of which he has sprung and part of which still inheres in him. Of 'New York Sketches' (illustrated), by Jesse Lynch Williams, published by Charles Scribner's Sons, we cannot say that either text or pictures are thoroughly satisfactory. The water front, High Bridge, and Brooklyn Bridge, for instance, are not by any means brought out in full perfection, to say nothing of the Park, certain street intersections emphasized by those unique structures, the elevated stations, etc. This is rather a prettified New York. Our own "New New York" is more impressive—picturesque at one point, grotesque at another, "stagey" at a third. " 'S giebt nur a' New York."

—At a first glance Mrs. M. Sturge Henderson's 'Three Centuries in North Oxfordshire' (Oxford: B. H. Blackwell; London: Edward Arnold) might seem to be of merely local interest, but a careful reading shows it to be of considerable value to students of the history of English social life in general. The district considered in this book is small in area, but its records afford material for an investigation of a wide range of topics, including witchcraft, the Journals of George Fox and John Wesley, eighteenth-century factories, Warren Hastings at Daylesford, early ideals of women's education, mail coaches, and the revolt of agricultural laborers under Joseph Arch. Mrs. Henderson's inquiries have led her to question some of the statements commonly made by historians. She finds, for instance, sufficient evidence to disprove the theory that the growth of factories called the apprenticeship system into being, and she believes that the influence of the railways upon the migration of villagers into the towns has been much over-estimated. This tendency had gone far before the railways came, as may be inferred from the serious overcrowding in Manchester, Leeds, Liverpool, and Birmingham at the time of the Chartist risings. "Further, the rustic in search of employment does not travel by train; any and every day he is to be seen drifting up to town by the highways and hedges." Among the many curious notabilia scattered up and down the book may be mentioned the custom of ringing the congregation out of church on Sunday morning at Charlbury, which is believed to be a survival of the mid-day Angelus. Record should also be made of the comment of an aged woman at Enstone, who attributes the decay of a friendly spirit in that village to a cheapened press. "Folks were neighborly in my young days; they had need, when the papers were sixpence," and were lent from hand to hand. The writer has collected her facts by means of a diligent burrowing in the Bodleian, especially among the files of the *Oxford Journal* from 1753 onwards, by researches in parish registers, and by the use of the manuscript diary of a cottage weaver who lived at Charlbury late in the eighteenth century. She has also drawn largely from local oral tradition, which she has had reason to regard as much more trustworthy than commonly supposed.

—The fifth volume of Prof. Paul Fredericq's monumental 'Corpus Documentorum Inquisitionis Neerlandicæ,' which appears with the new year (Ghent: J. Vuylsteke), comprises only the period between September 24, 1525, and December 31, 1528, with an appendix of additions to the previous volumes. The sixth volume, now in preparation, will embrace an even shorter term—the three years, 1529 to 1531. With this wealth of material and conscientious exhaustiveness of research it is to be feared that the end of this valuable collection is still far off, and until it is completed no one can venture to write on the struggle of the Netherlands for religious liberty. There is yet to come a quarter of a century of the domination of Charles V., and then nearly half a century of Philip II., while this latest section is that in which the interest is greatest and the documentary evidence most abundant. We can only hope that life and strength may be spared to Professor Fredericq for the completion of his gigantic and most useful task.

—The first persecution which forms the subject of the present volume, was brisk enough to test the endurance of the reformers and the popular favor with which the reform was accepted. The machinery of persecution was not yet scientifically organized, and its operation was somewhat

fitful, but the results were ghastly enough. Not the least suggestive among the documents are the accounts of expenses incurred in the execution of the sentences. When wood was dear, burning was not an economical process. When Hector van Dommenne was burnt at Bruges, the cordwood and faggots cost six livres, and a hundred bundles of straw thirty-six sous, to which the porterage added twenty sous; and in addition to this were the stake and the chains and other implements. The body, we are told, took a long while to burn, and it was not until evening that it was wholly reduced to ashes. When Pierrette Pourreau was burned at Fleurus, a bargain was made with Jehan, the "maistre de la haulte œuvre," by which he was paid five gold caroluses for his services in this and in torturing her twice; and there is a charge for three pots of wine given to her after the torture, for we are told that she was greatly exhausted. The confessors who attended her were likewise paid, but they were not admitted to the dinner with which the officers of justice regaled themselves after the execution, the cost of which they conscientiously charged to the town, so that the whole expense amounted to eleven livres, eight sous and six deniers. It is well sometimes to have a glimpse at the horrors of the good old times to which some sentimental enthusiasts look back with regret. The modern scientific study of history, so conspicuously illustrated in the admirable labors of Professor Fredericq, affords ample material to dispel the illusions so long maintained by writers of the romantic school.

THE CAMBRIDGE MODERN HISTORY.

The Cambridge Modern History. Planned by the late Lord Acton, LL.D., Regius Professor of Modern History. Edited by A. W. Ward, Litt.D.; G. W. Prothero, Litt.D.; Stanley Leathes, M.A. Volume I., The Renaissance. New York: The Macmillan Co. 1902.

Few books of our time have been awaited by the learned world with more interest than the first volume of what is designed to be the most full, comprehensive and scientific history of modern times in the English language, or perhaps in any language. Its French and German competitors are neither so large in scale, nor to so great an extent the work of accomplished specialists, as this series of volumes is intended to be. The conception belongs to the most learned English-speaking man of our time; and Lord Acton was not more remarkable for his learning than for the breadth of his views and the severity of the standard of accuracy and finish which he set before himself, and held up to the contributors whom he enlisted.

The plan of the series has some elements of novelty. Each volume is to contain a number of separate chapters on particular sections or aspects of the history of the period covered by the volume. These chapters are written by different hands, and from different points of view. For instance, of the last two chapters in the present volume, that entitled "The Ancient Catholic Church" is the work of Dr. Barry, a Roman Catholic priest, while that entitled "The Eve of the Reformation" has been prepared by one of the oldest and most respected of our historical scholars, a Protestant and distinctly a Protestant, Mr. Henry C. Lea, of Philadelphia. Moreover, the chapters do not constitute a connected narrative. Sometimes they treat what is almost the same topic over and over again from different sides. Thus, the policy and careers of Pope Alexander the Sixth and Pope Julius the Second are handled thrice in three of the five chapters that are devoted, and rightly devoted, to Italy in the days of the Renaissance. Thus one may say that the book is really a series of monographs arranged on a system, a collection of essays on history rather than an historical narrative. There are some obvious drawbacks to this scheme. It may be less convenient for the purposes of reference than the conventional and familiar kind of history. It may fail to give so clear a view of the order of events. But it ought to have the great merits of securing a more thorough treatment of each particular department of study than could be expected from the labor of any one man or small group of men, and of enabling the important facts of history to be brought into their true connection, so as to illustrate leading principles or tendencies, better than can be done where the chronological succession of events is strictly followed. The very selection of subjects, the very titles of the chapters, are suggestive of the way in which history ought to be studied, and reveal the mind that framed this comprehensive scheme.

Lord Acton has, to the inconsolable regret of those who knew his attainments, not lived to see even the first volume of the treatise published. Neither is there a word of his writing in it. The Introduction which he had, it is understood, intended to prefix to it, summing up what the Europe of the Renaissance had received from the Middle Ages, was never composed. Some sort of introduction was needed, for the late Dr. Creighton's introductory note relates only to the scheme of the work, and does not launch the work itself by giving a picture of things as they stood before the action begins. This loss may be regretted, but cannot be repaired.

To review with any attempt at completeness the nineteen essays contained in this volume would be impossible within the limits of an article in these columns, so we can only indicate the general impressions which the book makes upon us. One of these impressions is that of thoroughness. The whole field of European history is covered, except that Scotland, Russia, and the Scandinavian kingdoms are not dealt with, being apparently reserved for the next volume. The treatment is careful, the methods are exact. There is no eloquence, no effort at picturesqueness. Facts and views are packed tight together in an eminently businesslike way, which is like the German way, except that the style is not dull, and that there is more compression than most German scholars achieve. We say "the style," for although these nineteen monographs are from seventeen different pens, they have in common this quality of businesslike directness and this avoidance of all ornament, so that the differences in manner and language between the various writers are not salient. The intense practicality which most of the writers show is probably due to the sense they have of the limits of space to which they must conform. Compression excludes ornament, and reduces even philosophical reflections to their minimum. The result is a book in which nothing can be skipped. In the condensation of the vast mass of matter it contains it reminds one of a dictionary. Yet it is not dry. The writing is generally vigorous and pointed.

Sir Richard Jebb, for instance, in his chapter on the Classical Renaissance, manages, together with a long catalogue of names and books, to give lively and effective characterizations of some of the great figures, such as Erasmus. Mr. Armstrong analyzes the character of Savonarola with penetration, and describes the dramatic incidents of his career with spirit. Dr. Garnett presents a clear and graceful narrative of the complicated policy and enterprises of the Popedom from the accession of Sixtus IV. to the death of Julius II., and puts as good a face as can fairly and properly be put upon the conduct of Alexander VI. Mr. E. J. Payne, who has allotted to him two enormous subjects, "The Age of Discovery" and "The New World" (A. D. 1426-A. D. 1565), presents in these chapters a summary and philosophical view of the course of exploration in East and West, and of the foundation of the Spanish dominion in America. So, too, Dr. A. W. Ward (Master of Peterhouse), who has undertaken the very tangled history of the Netherlands, gives us, in the compass of forty-five pages, a succinct narrative and a weighty estimate of the economic as well as political causes which told upon the prosperity of the Flemish towns, and created that singular divergence between the course of their fortunes and those of the northern part of the Low Countries which has lasted ever since, and which embodied itself seventy years ago in the creation of the Belgian monarchy.

Though we have selected for the sake of illustration a few only out of the nineteen monographs which the book contains, we can say, after having tested every one of the nineteen, that a remarkably high level of care is maintained through them all, and that all are pervaded by a truly scientific spirit. It remains to note some points of detail in which the execution of a plan excellent in itself is susceptible of improvement.

One of these points is the addition of a chronological table of events for the period covered by the volume. As several of the monographs do not follow a strictly chronological order, and as no dates are given in the margin, it is not always easy for the reader to fix a date or to correlate one chapter with another by noting the contemporaneity of the events recorded. The construction of such a chronological table might no doubt be attended with some difficulty, for the field covered is so wide that a good many parallel columns dealing with the different countries would be required. Still, the attempt ought to be made, for even a table less than perfect would be a help to the ordinary reader, if not so often needed by the professional student. Another omission, that of footnotes, is expressly stated to be a feature of the plan, and may doubtless be defended by strong arguments. Yet the persistent adherence to it has some disadvantages, one of which is that when some remarkable passage in an author is quoted or referred to, we do not know where in that author's works to look for the passage, which it may be nec-

essary to examine in its *ipsissima verba* or with the context. The reference to some striking dicta of Francis Bacon's on pages 62-66 is an instance in point. There is, to be sure, at the end of the volume a very full and very carefully prepared bibliography for each monograph. It is a welcome addition to the volume, and compensates for the absence of constant references to the authorities on which the text of the several chapters is based. But it does not meet the particular difficulty to which we have referred. A third improvement, and one which might easily be introduced in the subsequent volumes, would be the amplification of the index to each volume, at present rather scanty. We are promised a full index to the whole work, but for that we shall have still some years to wait. Lastly, it would be a convenience—the point is small, yet worth a mention—to have in the corner, at the top of each page, the name of the writer of the particular chapter. The book is as much one for reference as for reading straight through, and it is rather troublesome to turn back to find in what particular author's hands one is at the moment.

Taken as a whole, this volume raises high hopes of the value to English historical literature which the work will have when completed. It brings together within a convenient compass a mass of carefully sifted and lucidly presented knowledge, such as one would otherwise have to extract from a large number of treatises, some, perhaps, not easy to procure. And it secures, better than most of us had ventured to hope, a certain unity of character and purpose. It makes the reader feel the similarity of conditions and influences which were at work in the chief countries of Europe, and it makes him also feel, though perhaps less clearly and fully, the differences in the circumstances of those countries which were destined to make the emancipation and stimulation of thought by the New Learning bear such different political and religious fruits in Spain and Italy, as compared with Germany and England. We rise from the book with a livelier sense of the skill with which its illustrious designer planned it, and with a sense also of the diligence and judgment shown by him and by the three eminent scholars who have succeeded to his work.

THE PHŒNICIANS AND THE ODYSSEY.

Les Phéniciens et l'Odyssée. Par Victor Bérard. Tome I. Paris: Armand Colin. 1902. Pp. 592, with 98 maps, plans, and cuts.

The Ancient Histories of a hundred years ago are as useless for scholars as a chemical treatise of the same year to a man of science. Hundreds of thousands of inscriptions have been found, bearing contemporary evidence to events in ancient Greece and Rome, Egypt, Babylonia, and Assyria, and clear light shines on many periods and lands which were shrouded in mist during the boyhood of scholars now living. The Hittites, whom many counted fabulous, have been rehabilitated as subjects of a widely extended empire. We are no longer obliged to scrutinize and weigh the evidence for the three accounts of the capture of Babylon as given by Herodotus, Xenophon, and the author of the Book of Daniel, since we have a contemporary report in the Annals of Nabonedus. But we know little more of the Phœnicians now than was known a century ago. The nation to which all western peoples indirectly owe their alphabets seems to have made little use of the art of writing to record its life and achievements in any of its trading-posts, which extended from the eastern end of the Mediterranean Sea to the Atlantic Ocean. As a trading people the Phœnicians may have cared little for literature in the modern sense, but we should expect to find at least some copies of private or public contracts, inscriptions containing details of privileges granted and conditions demanded, as evidence of their sojourn in Greece or Sicily in the early ages when they were the chief mariners of the world, and when the Phœnician "ships of Tarshish" corresponded to the British East Indiamen of half a century ago. But in fact we have no such monumental evidence of Phœnician settlements in any Greek lands, and are obliged to trust to old traditions, the indications of names, and traces of religious influence. The Greeks believed that Cadmus, the Phœnician, founded Bœotian Thebes; and many other memories of Phœnician settlements, with strange religious rites which seem to have been borrowed from the same people, were retained in various parts of Greece. The Hellenes thought of the Phœnicians as bold sailors at a time when the Greeks themselves shrank from any voyage which would take them out of sight of land. But, curiously enough, the Greek nautical terms seem to have been uninfluenced by those of the Phœnicians. This is the more curious since the English borrowed many such terms from the Dutch, and the French in turn have borrowed many from the English. We cannot, then, suppose the Greeks to have been the pupils of the Phœnicians in the art of navigation. In a rather long list of words of common life which Bérard believes the Greeks to have borrowed from the Phœnicians, is found no nautical term Influenced by similar observations, the historian Beloch goes so far as to say that "nothing proves the presence of the Phœnicians in the primitive Aegean." The book before us is intended to furnish such proof.

According to his publisher's announcement, Bérard aims to do for Homeric geography what Schliemann and Evans have done for Homeric history, and in particular to show that the Homeric accounts of places are not drawn from the imagination, even in what has been considered fairyland. He believes that the grotto of Calypso, the river of Nausicaa, the meadow of the Sirens, and the cave of Polyphemus may still be identified, and he accepts for the most part the old traditions as to the sites: Corfu is the land of the Phæacians, and Charybdis is the strait between Italy and Sicily. Like Strabo and Schliemann, he has full faith in the literal accuracy, the inerrancy, of the Homeric poems. His two main theses are, first, that a Phœnician thalassocracy in the Mediterranean either preceded or was contemporaneous with the composition of the Odyssey, about 850 B. C.; and, second, that the poet had before him the original or a translation of a Phœnician *periplus*, or itinerary, of a coasting voyage about the Mediterranean. The poet, on his theory, had not seen with his own eyes the sites of which he gives an account, but, on the other hand, he does not trust to "sailors' yarns." "The Homeric poems presuppose not only the use of writing, but also the study of written material." The poet was a native of Asia Minor, and had never been in Peloponnesus; the stories with regard to sandy Pylus were handed down in the royal family of Miletus, which claimed descent from old Nestor. To Bérard the wanderings of Odysseus appear a Phœnician (whether Sidonian or Carthaginian) *periplus*, put into Greek verse and poetic legends, with "anthropomorphizing of objects, humanizing of the forces of nature, and Hellenizing of the subject-matter." In names, routes, customs, conceptions, and theories, the Odyssey seems to our author to be not Greek. Even certain expressions (as "I have the honor to be," εὔχομαι εἶναι) seem to him Phœnician rather than Hellenic, and at least once the poet is suspected to have mistranslated an ambiguous Phœnician word. In short, Bérard accepts most heartily the doctrine that the Phœnicians were the masters of Homer. The distinguished Germanist Müllenhoff of Berlin suggested a similar theory thirty years ago, but did not advance detailed arguments in support of his position.

The Homeric material for a study of the Phœnicians is limited. They are mentioned in but six passages of the poems, twice in the Iliad, and four times in the Odyssey, and none of these passages gives detailed information. The poet tells us of Phœnicians in relations with Egypt, Crete, Libya, Elis, Lemnos, and Syrie (wherever this may be). They are characterized as sailors and traders, as skilful weavers and silversmiths, as tricky rogues who are ready to kidnap children or men and sell them into slavery. This is all that Homer has to say of them, and it seems a small basis for a work of which the first volume has 592 large pages.

Bérard was a member of the French School at Athens for three years, 1887-90, and had charge of the French excavations at Mantinea and Tegea, but he does not call himself an archæologist—rather he distrusts the conclusions of archæology. This distrust may be explained in part by the fact that archæology has little to say in favor of his theories. The references at the foot of the pages in the work before us are almost entirely to the accounts of ancient and modern travellers, and above all to the French Government's *Instructions Nautiques*. The greater part of the volume has been published in substance previously, mostly in the *Revue Archéologique;* but in the spring of 1901 the author followed in the track of Odysseus, accompanied by Mme. Bérard, who carried her photographic camera and furnished more than fifty views for this volume. The author has not been content with the study of maps and documents, but his eyes have seen land and sea from the point of view of the old mariners. He furnishes the reader, however, with many excellent maps, chiefly from the charts of the French Admiralty.

The author's main reliance for the establishment of his theses is on "topology and toponymy." Topology he would have re-

lated to topography as geology to geography. The *-logies* penetrate beneath the surface to the law and reason of things. Topology shows under what circumstances and in what relations, with what ambitions and in what degree of culture, a definite site would be chosen as a centre of trade or of political life. If the circumstances are known, topology points confidently to the site; if the site is known, topology indicates the circumstances which led to its choice. Traders who come from the East are likely to seek different harbors from those chosen by traders from the West. Thus, in Sicily, Greek commerce brought wealth to Syracuse, Carthaginian to Agrigentum, and Roman to Palermo, and Bérard claims that the earliest cities of the Greek archipelago were built with reference to Phœnicia and Egypt. A trading-post held by foreigners will have a different situation from one controlled by the people of the country. Chalcedon, opposite Byzantium, and Byzantium itself are taken as types of the two forms of harbor desired by the earlier and the later commerce. Chalcedon was fitted not to control the land but to be independent of it, and this was a characteristic of the Phœnician settlements, in contrast with those of the Greeks, who came to remain and desired to extend their control over the territory. Bérard has made a careful study of the conditions of navigation on the Mediterranean in the second millennium B. C., with constant comparison of modern experiences, and large quotations from the *Instructions Nautiques*, showing what was natural and practicable and what was impossible for the early mariners with open boats. No one before him has applied modern knowledge of the Mediterranean and Aegean seas, their harbors, their currents, and their winds, to the interpretation of ancient Greek literature. Side by side with the Homeric story are placed extracts from modern authorities which illustrate the poet's familiarity with winds and currents.

Our author's consideration of the Greek trade routes by land is interesting, too. Athens had two harbors, the Piræus or Phalerum on the Saronic Gulf, and Oropus on the Eubœan Strait. Thebes had three harbors—one on the Corinthian Gulf, Megara on the Saronic Gulf, and Chalcis at the Euripus. In Argolis, Mycenæ, strongly and magnificently built in the uttermost recess of the plain, about a day's journey from the coast, on the flank of a mountain and fortified by cliffs and ravines, is the key to the passage between the Gulfs of Nauplia and of Corinth, and its masters took tribute from the passing caravans. The neighboring fields alone could never have made Mycenæ "rich in gold." According to Bérard, a great trade route in very early times crossed Arcadia, starting at Gythium, and ending at Triphylian Pylus, a little south of the mouth of the Alpheus, with stations at Sparta, Lycosura, and Aliphera. He makes the best argument which has been offered for Triphylian Pylus as the seat of old Nestor, and identifies the site with Samikon, a little south of Olympia, where, at a height of about 900 feet, are walls which Lolling in Baedeker's Guide calls "perhaps the finest extant specimen of the ancient Greek polygonal building style."

In treating of toponymy, the author is conscious that he is on dangerous ground. He lays no stress on the Phœnician derivation of isolated names, but seeks a series of names, or still better a doublet, where the Phœnician and the Greek names exist side by side—as, Thera (said to mean *Beautiful* in Phœnician) is equivalent to *Kalliste*. A group of Phœnician names is found about Megara. Salamis, of course, is the Port of Peace; compare Melchizedek "King of *Salem*," which is King of Peace, and *Solomon*, who was a man of peace as compared with his father, and the modern *salaam*, which implies a wish for peace. Megara itself is interpreted as meaning *cavern;* Caria, its acropolis, means *city* (compare *Car*thage, 'Newtown'); its King Nisus is a *Hawk*, and Nisæa, the promontory of its harbor, is *Hawk's Point;* Minoa, the island off its harbor, is the *Island of Rest* (compare Manoah, father of Samson); Abroté, the wife of Nisus, is *Flying Thing;* their daughter Scylla is *Rock*. Cadmus, of course, is Kedem, the *Man from the East*, and Europa is the *One from the West;* but why the Greeks should have used Phœnician words for these designations the author does not tell. All these etymologies must be judged by specialists in Semitic philology; and clearly, if they stand, we must assume an important Phœnician settlement, much more than a mere trading-post, at Megara, and a well-established trade route through Bœotia under the control of the same people. Why the Phœnicians withdrew from a land where they had such a footing, our author does not consider. No Greek tradition mentions a conflict of races, an anti-Semitic war, which might have led to their expulsion.

The Homeric Syrie is identified with the modern Syra, which was the chief seaport of the Aegean Sea during a large part of the last century. This was of no importance in Hellenic times, and is hardly mentioned by Greek authors; all the ancient inscriptions found on the island are of the Roman period. Bérard tries to show that it was, however, a natural centre of trade for Phœnician corsairs, and had just such a port as they liked, with adjoining islet. The name Syrie he believes to be a mere repetition of Tyre, *Rock*, and the same as Syria east of the Mediterranean. Another instance of this root he finds in Syracuse, which he considers a Phœnician name for *Rock of the Halcyon*. Another identification is that of the island of Calypso with a Parsley Island (Isla de Perejil) at the foot of Apes Hill, just outside of the Strait of Gibraltar, though this has no springs, no trees, and no vines. The Phœnician name of this island Bérard believes to have been I-Spania, equivalent to *la Cachette, Calypso*, and he thinks it to have had such prominence in itineraries that it became attached to the neighboring region on the north, when the island itself was superseded by Tarshish, and that thence we have received our name for Spain.

The last ninety pages of the volume are devoted to an argument to prove that the city of the Phæacians was on a promontory of the west coast of the island of Corfu, just across the island from the main harbor. The Homeric land and city of the Phæacians have distinct characteristics, but such as are found in other parts of the Mediterranean. The land had high mountains, cliffs by the sea, and reefs; at a little distance from the rocks, a river flowing into the sea, with sloping pebbly banks, where women came from the city to lave their linen; a city surrounded by a high wall, on a peninsula with a harbor on either side; a sacred grove, with a place of assembly; and copious springs which irrigated the king's garden by the palace, and supplied the town with water. The promontory chosen by Bérard seems not more than 1,000 feet long or broad, and at least 250 feet high. The sides are precipitous, and the slope toward the open sea is at an angle of about forty-five degrees. The site never was surrounded by a wall, and has no spring upon it; no remains of ancient buildings have been found. The river to which Nausicaa and her maidens resorted for laundry purposes is found so far away that the author spent an hour and a half in driving from it to the promontory over a macadamized road; and the photographs show it to be no broad stream such as that up which Odysseus swam—in fact, no one could swim in it at all—and the shipwrecked hero might better have made his way upon the shore on either side of the stream. One who interprets Homer so literally as Bérard, ought also to appreciate the force of this objection to Corfu as the land of the Phæacians: from Calypso's island, which, as we have seen, he thinks to be at the Strait of Gibraltar, Odysseus sails for seventeen days and nights "with the Great Bear which men call also the Wain on his left hand," *i. e.*, due east. Then he is shipwrecked, and driven by a strong north wind for two days and nights before he reaches the land of the Phæacians. If he was north of Corfu at the time of his shipwreck, he had sailed directly past his home on Ithaca, which nothing indicates. But if, as the Homeric story would show, he was due east of Gibraltar when the storm struck him, the north wind would have carried him to Africa and not up the Adriatic. Thus we cannot accept this proof for the identification of the site. In company with several distinguished scholars, who have laid stress on the good seamanship of the two peoples, Bérard believes the Phæacians to be Phœnicians. But these scholars have failed to notice that while the Phœnicians are eminently traders, the bitterest insult which a young Phæacian noble can devise for Odysseus is the word that he "does not seem like an athlete, but like one who goes as commander of seamen or as a supercargo, to be mindful of wares and gains." Odysseus himself and the rest accept this as an insult, and the young noble is compelled to make an humble apology; but no Homeric Phœnician could have felt or shown such disdain for trade.

In his second volume, Bérard proposes to identify the cave of Polyphemus, the home of Circe, and the other places visited by Odysseus. The exact relations of these places he believes to have been perfectly distinct to the minds of the Carthaginians, who invented the dreadful stories about them in order to frighten the Greeks away from their trading-posts. They desired to retain their monopoly in the west.

The work is well printed and beautifully illustrated. The author's style is pleasant and idiomatic, and the reader is annoyed by few minor errors in interpretation. We trust a good index will accompany the second volume, for a large amount of interesting matter is introduced where an ordinary reader might not expect it.

SULLY'S ESSAY ON LAUGHTER.

An Essay on Laughter: Its Forms, its Causes, its Development, and its Value. By James Sully, M.A., LL.D. Longmans, Green & Co. 1902. 441 pp.

That pleasure and pain tread on each other's heels, that veiled Melancholy sits "in the very temple of Delight," is now the commonplace of every minor poet. Like so many other truths, this was detected by the fine palate of Plato, and in his 'Philebus' makes a first appearance in philosophical literature. Aristotle and Burton pursued the discussion of mirth as the complement of melancholy, and, in poetry, from Andromache's tearful smile in the Iliad to Keats and Swinburne, "Pleasure with pain for leaven" has been sung as the portion of man. Aristotle's lost essay on Comedy was written as a companion-piece to his theory of Tragedy. But for a thorough and independent treatment of laughter, the world has had to wait for the inspiration of modern psychology.

Prof. Sully, who is well known as the author of 'The Human Mind' and 'Studies of Childhood,' has now given us a serious inquiry into the laws that control laughter, and a determined attempt to define the characteristics and the limits of the objective region of the laughable. So far the psychologist. But Professor Sully is a philosopher, which is more than can be said for many modern psychologists. He goes on to test the value of laughter in human relations, and to give it a purpose in the scheme of human life. To quote his own summary (p. 392):

"In looking for the germ of laughter, we found ourselves in the wide and misty plains of biological speculation. In tracing its development, we took a dip into the pleasant vales of child-psychology and anthropology, and then tried to climb the winding paths of social evolution. Having reached in this way the heights of modern civilization, we made a special investigation into the social organization of laughter, as represented in the art of comedy, and into the gradual appearance of a new type of laughter, essentially individual and independent of the social standard, to which is given the name of humor. Throughout this voyage of discovery we have kept in view the function of the laughing spirit in the life of the individual and of the community."

Professor Sully, in reviewing previous theories, dismisses as too remote for the conceptions of the ordinary man the Hegelian notion that "the comic is a moment in the dialectic process which the æsthetic Idea has to pass through," and dwells chiefly on the theories of Kant and Schopenhauer. Two ways of envisaging the laughable stand out conspicuously in the history of the subject. The moral theory, or theory of degradation, dates from Aristotle, who said that comedy is "an imitation of characters of a lower type—not, however, in the full sense of the word bad." Hobbes amplified this theory of the ludicrous, and defined laughter as a "sudden glory" at the realization of the inferiority of others to one's self. "All the world is queer," said the Quaker, "except thee and me; and even thee is a little queer." When we laugh at this, our mirth is due to the "sudden glory" that follows on our immediate recognition of our superiority to the complacent Quaker. Bain enlarges Hobbes's principle, and improves on it by adding that, in addition to the emotion of power or glory, the spectacle of degradation brings with it the feeling of release from constraint.

The second main theory is that of incongruity. This is intellectual rather than moral, and goes back to Schopenhauer. It is an interesting point that the German theories of laughter tend to be intellectual, like their theories of ethics, while the British philosophers dwell on the moral aspects of laughter as of ethics. Schopenhauer's theory of incongruity is important, but the illustration that he selects is worthy of a German metaphysician. It is "the amusing look of the angle formed by the meeting of the tangent and the curve of the circle; which look is due to the reflection that an angle implies the meeting of two lines which, when prolonged, intersect, whereas the straight line of the tangent and the curve of the circle are able merely to graze at one point, where, strictly speaking, they are parallel." The illustration is unconvincing, but an element of incongruity must stand in a comprehensive theory of laughter. Kant's theory placed the cause of laughter in "the sudden transformation of a tense expectation into nothing." One objection to such one-sided theories is that, as Lotze said of Kant's explanation, they do not show us why we should *laugh* rather than cough or sigh at a moment, say, of dissolved expectation. Professor Sully easily shows that such hypotheses will not bear the strain put upon them. Loss of dignity and incongruity will account for many occasions of laughter, and they often coöperate. Herbert Spencer's phrase, a "descending incongruity," obviously combines them, but the realm of the ludicrous is wider than the theorists have implied.

Professor Sully's inquiry into the occasions and causes of laughter dwells at length on forms that are due to a sense stimulus, where the intellect is subordinate, *e. g.*, the laughter due to tickling. In drawing up twelve categories of the laughable, he points out that the things we laugh at have usually more than one "distinguishably amusing facet." It is not always easy to say where the fun begins or which kind of fun it is. One chapter is devoted to the origin of laughter in the inevitable cradle of the race, and discusses the supposed rudiments of mirth in animals. That the laugh followed the smile is a theory supported by the study of the modern infant, whose babble is a prelude to laughter as to speech. Professor Sully goes on to trace in some detail the development of laughter during the first three years of the life of certain babies who lived, as it were, under the microscope, who never smiled unseen, who were tickled for the purposes of statistics, whose every passing emotion was recorded with a date as a contribution to Child-Study.

The eighth chapter, on the "Laughter of Savages," appeared as an essay in the *International Monthly*, and one may note in passing that every one of Professor Sully's chapters would stand alone as a separate essay. The social uses of laughter, the influence of the mirthful spirit on social changes and the refining effects of culture on hilarity are discussed in detail. Professor Sully finds in several varieties of laughter a relief from strain; this would account for the explosive vigor which is one element in a laugh. "Perhaps the first great laugh was produced by man, or by his proximate progenitor, when relief came after fear or the strain of battle." The nervous titter of a congregation at an incident in church that seems unbefitting the solemnity of the occasion should, he thinks, be classed rather as a case of this relief from nervous tension than as a case of "degradation." Another element in laughter that has been practically ignored in German theories is the play-mood. "To be glad with the gaiety of laughter, to throw off the stiff and wearing attitude of seriousness, . . . is in truth to begin to play" (p. 145). Professor Sully therefore makes the principle of play fundamental in his theory of laughter.

The distinction between choral laughter, which is declining, and humor, which is individual laughter and probably on the increase, leads to a charming chapter on "Humour," the laugh of the mind. One remembers the regret expressed by Flaubert that, as he grew older, his sympathy for men and things became disproportionately keen and destroyed his sense of humor. Professor Sully tells us that, though sympathy is essential to humor, it must not be allowed to overbalance one's humorous appreciation. Humor, "nourished by sympathy, tends, when something of philosophic width of contemplation is reached, to combine the social and the individual mode of projection by taking up the self into the spectacle of the whole." Satire, on the other hand, projects society, turning it into derision; while comedy projects the eccentric individual or group of individuals as a laughable show. In the realm of art, comedy plays the most important rôle in stimulating the laughter of mankind. Professor Sully's analysis of comedy, to which he devotes one of his longest chapters, is about as long as Mr. Meredith's fascinating essay; if not so brilliant, it is more profound and not less humorous. It might well be reprinted separately as a contribution to literature for the sake of those whom the present work might not reach.

In his last chapter, on the "Value and Limitations of Laughter," Professor Sully does not forget the claims of the "agelast"—to use Mr. Meredith's word. Laughter is not for those who have a great mission in life and live in the shadow of a cause.

"If Rousseau had been a great laugher, we should certainly never have had his picturesque and instructive attack on civilization and all that flowed from it. Would Dante and Milton and the other builders of the vast and sombre architecture of verse have achieved their task if the laughing imp had been pulling vigorously at their coat tails? How many of our valuable social institutions would have been built up if the beginners had been keenly alive to the absurd aspects of the bunglings which are wont to characterize first attempts?" (p. 425).

Professor Sully's forecast of the future of laughter is cautious as befits a humorist. But he points out certain tendencies which bear on the question. This is not an age of mirth or optimism. We no longer talk, like our grandfathers, of the perfectibility of man. Our enthusiasm for the future is mainly devoted to the perfectibility of machinery.

"It is as though men had no time to laugh. Even at a social entertainment you will find men and women who meet your playful challenge only with a niggardly giggle, which they instantly suppress; poor

distracted souls, unable for a moment to free themselves from the chaos of social claims which haunts them."

Even the deep-chested, hearty laugh of the savage is being replaced by the "mission giggle." We know of communities that do very well without laughter of any kind. But Professor Sully hopes for the maintenance and increase of the humorous spirit; laughter saturated with reflection may survive and preserve the capacity for a happier age. Professor Sully is himself a worthy successor of that "laughing philosopher" of Greece whose epithet seems to indicate the rarity of the type in those days of truer choral laughter. His present work will appeal, as did his essay on "Pessimism," to the student of literature no less than to the psychologist and the philosopher.

Wayfarers in Italy. By Katharine Hooker. Charles Scribner's Sons. 1903. Pp. 309.

A lady traveller who goes to Brescia under the impression that it is an unknown city, and still says nothing about the masterpieces of early Renaissance architecture that are its glory, nothing about the number and beauty of the altarpieces of Moretto there (though painting is what she has specially come to Italy to see), and nothing about the statue of the Winged Victory, should compensate us in some way for these remarkable omissions. She does, indeed, note the number of fountains, in which Brescia is second only to Rome among the cities of Italy. For the rest, she found the pillow of her bed unpleasantly hard and knobby, and indulges thereanent in a disquisition on bedclothes in out-of-the-way places. She followed the counsel of some wiseacre, and, instead of breakfasting comfortably at the hotel, went out to a café, where she deservedly got bad coffee and worse butter (but good rolls), which she consumed in an atmosphere of cigarette smoke. She records the liking she has for the fussy circumstance of getting rarely visited picture galleries opened for her, as well as for "browsing" alone among the treasures inside. She pays her tribute to the charm of Italian politeness as exemplified in a lady of whom she asked her way, and with whom she made a bit of conversation by telling that she was from America. She makes it quite clear that Brescia was altogether to her mind, and—that is all. No, she took a lovely drive to Paitone to see a picture by Moretto, told the coachman before getting there that she had come all the way from America to see it, and then spent so much time in missing the right chapel that at last she had only a twilight vision—glorified, it is true—of the beautiful Madonna. As an account of Brescia the chapter is to the last degree insufficient, but there is something to be said for it as a record of personal impressions and experience.

This lady belongs to a class of travellers of which America furnishes a larger contingent than any other country. We hasten to say that as a class it is a very good sort. We have often admired its union of energy in seeing all there is to be seen, with enjoyment of everything that is beautiful, or grotesque, or human; its happy philosophy over the petty miseries of travel, and its unfailing kindness to all with whom it has to do. It is never grudging in the matter of fees, though it has its notion of thrift; it may be indignant at impositions, but is never soured by them, and we do not fear the reproach of a bull when we say that it waters its path with the milk of human kindness. If sometimes sentimental, it is, on the whole, more just to apply to its members the term *genial;* they restore its ancient respectability to a word that in our day has been sadly abused. It is quite a matter of course that they, almost without exception, come from families in which good breeding and a certain culture are hereditary. If they are neither profound scholars nor connoisseurs, they at least inform themselves from good books, and they prefer good works of art to bad. The author under consideration shows a particularly nice taste in paintings, and a knowledge of contemporary Italian poetry that is far from common.

A word, however, as to the feelings for art of this and of many other writers. A lady, who did not exactly belong to the class of which we have been speaking, was the wife of the American consul in a large city which boasts one of the most magnificent galleries of pictures in the world. She confided, however, to the consul of a European Power that she did not care much for the old masters in the museum: "There was nothing in them that spoke to a mother's heart." This consul, inspired, no doubt, by motives that were not of the noblest, lost no time before repeating, with a touch of malice, to colleagues and friends, the worthy lady's opinion; and yet he must have known that of those who unfeignedly admire those same pictures, the greater part resemble the American lady in that the art of them is not what they appreciate, and that they seek in them the gratification of some sentiment that is not æsthetic. They differ from her in that they find what they seek, while she did not. In the book under examination the somewhat rare mention of pictures seems to indicate that the ruling interest in them is human, and yet they reveal refined perceptions and familiarity with what is best in art, which is as much as we have a right to ask of them. They are quite in harmony with the predominant characteristics of the book, which are those of an intelligent woman with keen and varied sympathies and of infinite kindliness.

And it is this last quality that overtops all the others: the railway porters, the waiters, the *vetturini*, the custodians who serve her (and, as a matter of course, her gondolier), the very children who follow her, all come in for such immortality as she can bestow upon them. She is continually getting interested in people in the streets, in shops, wherever she goes, in fact, and in telling of them she forgets to describe the churches, galleries, palaces, that are what she thought she came for. And every once in a while she manages to invade some interior, humble or palatial, and then a great cementing of the universal brotherhood takes place. She is always delighted with the spontaneous, sunny character of Italian politeness, and it bespeaks an answering quality in the genial traveller that she so frequently elicits and so heartily responds to its charm. If "kind hearts are more than coronets," we may assume that a record of Italo-American civilities is worth any amount of amateur description of well-known monuments, and may even be accepted in place of art criticism. It is certain that such a work does not encroach upon the province of the guide-book. When she will, however, our author can interest her readers in things as well as persons; the chapter on Avezzano and the results obtained by Prince Torlonia from the draining of Lake Fucino, by way of example, is there to prove the contrary. Her muse is homely, and in general chooses to tell about things not too bright and good for human nature's daily food; but we shall have given an erroneous idea of our opinion if we have not made it plain that we have enjoyed reading 'Wayfarers in Italy,' of which it is no disparagement to say that, of all the pleasant things in it, the pleasantest is the evidence it furnishes as to the character of the writer, one of the best and most charming examples of the class to which we have assigned her.

From blunders in statement or in the use of Italian words, and other common blemishes of a tourist's book, this one is commendably free. We may say, however, that *panetone* (always under the same name) is a specialty of most of the cities of north Italy, and not of Venice alone. We are puzzled, too, at being told that Fiesole is to the *south* of Florence, that the Anglo-American hotel in that city is "a little too far up the river," and that driving westward from Brescia the mountains are to your left. It is still more to be regretted that, in telling of the Poldi-Pezzoli museum at Milan, the things that our writer thought alone worthy of anything approaching description, are the only serious lapses from taste in that charming collection.

The volume is a fair one to look upon, well printed on good paper, and illustrated with photographs taken by one of the author's company, which never repeat the things that Alinari and Brogi and Naya and Anderson have made familiar to all the world, and are sometimes good. There is a sufficient index.

Modern Spiritualism: A History and a Criticism. By Frank Podmore. London: Methuen; New York: Scribners. 1902. 2 vols., xviii., 307; xii., 374.

Mr. Podmore is the most sceptical of psychical researchers; so sceptical, indeed, that his readers must sometimes wonder why he should have thought it worth his while to persist in his researchings into a subject which he seems to consider as mostly, if not entirely, compounded of varying proportions of fraud and delusion. At the same time, he is one of the very few of the writers on such topics who has really studied them, and possesses an extensive and first-hand acquaintance with the evidence. He is thus well equipped for a critical history of Spiritualism, and has, moreover, extended his researches into the obscurest depths of an almost inaccessible and forgotten literature. And as he selects judiciously, writes well, and has provided a good index, the resulting book is not only interesting, but likely to become the standard work on the subject. The only drawback is the bias; for Mr. Podmore seems to assume that there is something intrinsically absurd and incredible about the spiritualistic interpretation of the anomalous phenomena connected with trance, antomatism, hypnotism, and mediumship. But as Mr. Podmore makes no attempt to conceal his bias, and

not infrequently allows it to provoke him to entertainingly satirical remarks, and as, moreover, a similar bias is very widely prevalent among cultivated persons, it is not likely to be a serious obstacle to the success of his work. Mr. Podmore's danger is rather that he may seem to his readers to have been too successful in explaining everything away, and may thereby destroy the interest in his study. In this way his very ingenuity and plausibility, acting on a public which is either wildly credulous or unjustifiably indifferent, may operate as a real hindrance to the further exploration which his subject seems manifestly to require.

And so it seems not inappropriate to point out that Mr. Podmore's rationalistic explanations are by no means always completely satisfactory. In dealing, *e. g.*, with the extraordinary testimony for D. D. Home's miracles, Mr. Podmore is driven to a number of rather violent hypotheses, which culminate in the attribution to Home (ii., p. 269) of "a faculty of inducing false perceptions in his clients." And even his scepticism, which appears to be largely temperamental, is clearly distinguishable from the scepticism either of vulgar ignorance or of scientific conservatism, and has, moreover, to make a number of concessions to the facts. He admits, for instance, that the long-continued denial of the facts of hypnotism by medical orthodoxy was highly discreditable. He concedes in the main the genuineness of the various automatisms, trances, impersonations, inspirational speaking and writing, etc., even though he explains them by psychological principles which could hardly have been devised but for the interest in these phenomena. He makes a point of accepting the telepathic experiments of the Society for Psychical Research, although he doubts whether the thought-transference they seem to imply involves more than an obscure action of brain upon brain. He needs, indeed, to assume telepathy in order to explain the evidence derived from Mrs. Piper's trances, which produces (ii., p. 345) "the almost complete conviction that Mrs. Piper is possessed of some faculty beyond the normal—a faculty at the lowest of tapping the thoughts of her interviewers."

But beyond this Mr. Podmore will not go: to communications from the dead he will only say "not proven." To that, perhaps, a judicious man, viewing the present state of the evidence and the imperfections of all but the most recent records, would be inclined to agree; but there would also seem to him to be occasion enough for further inquiry in the matter, and glimpses enough of stupendous possibilities to demand from him the preservation of a perfectly open-minded suspense of judgment. This position Mr. Podmore would not, apparently, grant him; for he attributes to nature, what certainly seems true of human nature—an abhorrence of a mugwump (i., p. xviii.). But perhaps there are cases, in science as in politics, when the attitude of a mugwump is more intrinsically reasonable than that either of a partisan or of a Gallio.

Ancient and Modern Engineering and the Isthmian Canal. By William H. Burr, C.E. John Wiley & Sons.

This book, as stated in the preface or introduction, consists of six parts, each part representing a lecture delivered at the Cooper Union in New York, in the early months of 1902. The first four lectures, which cover the subjects of Ancient and Modern Engineering, have been extended into several chapters of very unequal lengths. The last two lectures, one of which describes the Nicaragua Canal and the other the Panama Canal, and which are practically condensations of the report of the Isthmian Canal Commission, of which Mr. Burr was a member, are apparently printed about as they were delivered. Ancient Engineering is covered by the first part, consisting of five chapters, which contain descriptions of hydraulic and structural works from the early Egyptian period to the Roman. Modern Engineering is divided into three parts, Bridges, Waterworks, and Railroads, a division which the author can hardly have intended to be exhaustive, and which excludes the principal branches of mechanical and electrical engineering, as well as the development of water powers, one of the most important branches of civil engineering. It would, of course, be impossible to cover all these subjects in six lectures in any satisfactory way, but it might have been wiser to adopt a title limited to the subjects treated.

In general, the book is of a popular character, easily understood by the average reader. The second part, however, is an exception, as six of its eight chapters are largely mathematical. The book is well illustrated, and is a very fair presentation of the specific subjects which it covers. Two or three errors may be pointed out. In the early portion granite is spoken of as the prominent material in the Egyptian pyramids, which are almost entirely limestone, granite being used only in a few trimmings. Another unfortunate error appears on page 326, where the gauge of 4 feet 8½ inches on the New York Central Railroad and 4 feet 9 inches on the Pennsylvania Railroad is shown between centres of rails instead of the clear distance between heads—an error so obvious that it would not trouble an engineer, but might impart erroneous ideas to a layman. In the historical section devoted to bridges, one is tempted to ask why, in the list of wooden trusses now superseded, the MacCallum truss, which was for a time one of the most prominent, is omitted.

A book of this kind, which is largely a compilation, loses much of its value from lack of an index. The author's belief that the table of contents supplies the information ordinarily given by a comprehensive index, is one with which persons accustomed to use an index are very loath to agree.

AGNOSTICISM

By ROBERT FLINT, D.D., LL.D., F.R.S.E.

Corresponding Member of the Institute of France; Professor of Divinity in the University of Edinburgh; author of "Anti-Theistic Theories," "The Philosophy of History in Europe," "Theism," etc.

The Outlook says:

"Dr. Flint's eminence among representative writers upon Theism commands attention to his treatment of Agnosticism. No writer that we are aware of has treated it so amply and thoroughly as here. Its history, erroneous views of it, its distinguished representatives, its various forms, its relations to various subjects, are successively discussed, both critically and constructively, so as to illuminate the validity of theistic belief."

CONTENTS: I. The Nature of Agnosticism. II. Erroneous Views of Agnosticism. III. History of Agnosticism. IV. Agnosticism of Hume and Kent. V. Complete or Absolute Agnosticism. VI. On Mitigated and Partial Agnosticism and Their Forms. VII. Partial or Limited Agnosticism as to Ultimate Objects of Knowledge. VIII. Agnosticism as to God. IX. Agnosticism as to Religious Belief. X. Agnosticism as to Knowledge of God.

8vo, $2.00 *net* (postage 20 cents)

By the Author of "Art for Art's Sake"

THE MEANING OF PICTURES

By JOHN C. VAN DYKE

PROFESSOR VAN DYKE'S new volume relates to the substance of pictorial art, as his "Art for Art's Sake" did to its technic. It is an explanation of, and a plea for, the beholder's point of view, which he deems as legitimate as that of the artist. He discusses the personal and the decorative elements in a work of art with great fulness and penetration, and he brings out the true significance of painting as he has heretofore explained its modes of expression. Taken together the two works form an original and concise exposition of the philosophy of painting.

Freely illustrated, $1.25 *net* (postage 10 cents)

CONTENTS

Truth in Painting
Individuality, or the Personal Element
Imagination of the Artist
Pictorial Poetry
The Decorative Quality
Subject in Painting

Also this Romance of the French Revolution

CALVERT OF STRATHORE

By CARTER GOODLOE

A VERY original and mature piece of work from an entirely new point of view, recreating the life of the American Legation at Paris during the French Revolution.

With Christy Frontispiece in colors, $1.50

The great Americans, Jefferson and Gouverneur Morris, move through this dark and adventurous period, illuminating it with their clear intelligence.

SPRING ANNOUNCEMENT

THE WARD OF KING CANUTE

A ROMANCE OF THE DANISH CONQUEST

By Ottilie A. Liljencrantz, author of "The Thrall of Leif the Lucky"

With 6 full-page illustrations in color and other decorations by the Kinneys

Few young writers have been so exceptionally successful as Miss Liljencrantz in obtaining the elusive quality called "atmosphere." It is the one absolute essential in a romantic novel, and it was the presence of this quality that made her first book, "The Thrall of Leif the Lucky," so successful. This new book is a romance of the Danish Conquest of England, with pictures by the artists who made the famous illustrations for "The Thrall." ($1.50.)

FELICITAS

By Felix Dahn, author of "A Captive of the Roman Eagles." Translated by Mary J. Safford

The second volume in the great German author's trio of historical romances, based on the early struggles between Germany and Rome. The third volume is in preparation. ($1.50.)

A SELECTION FROM THE BEST ENGLISH ESSAYS

WITH AN HISTORICAL AND CRITICAL STUDY OF ENGLISH PROSE STYLE

By Sherwin Cody

Uniform with Mr. Cody's "A Selection from the World's Greatest Short Stories."

What Mr. Cody did so successfully for the short story in his earlier book he aims to do in this volume for the masterpieces of English style. "The Greatest Short Stories" has now been adopted by twelve large universities and over twenty smaller institutions. ($1.00 *net.*)

THE SOULS OF BLACK FOLK

By William Burghardt DuBois

An extraordinarily vital and interesting book by an able advocate of his race's spiritual rights. Mr. DuBois is a graduate of Harvard University and a professor in the University of Atlanta, and himself a man of great culture, he has always contended for the spiritual uplifting of the negro as opposed to Mr. Booker Washington's practical and material theories. He is for right and justice to his people: Mr. Washington for policy and expediency. Altogether the book is a human document quite unlike anything that has appeared in years. ($1.20 *net.*)

REFLECTIONS OF A LONELY MAN

By "A. C. M."

A delightfully entertaining and original little volume, in which humor and philosophy are judiciously mingled, and distinguished by an unusual lightness of touch. ($1.00 *net.*)

CARTOONS BY McCUTCHEON

With an Introduction by George Ade

When Prince Henry was covering this country, the *Chicago Record-Herald* followed his movements with a series of cartoons that would have made the artist famous had he not been so already. The originals now hang in the Prince's palace at Kiel, but their reproductions, and seventy-five or eighty others, political, humorous, and always delightful, will be found in this portfolio. ($1.20 *net.*)

THE LAW OF MENTAL MEDICINE

By Thomson J. Hudson, LL.D., author of "The Law of Psychic Phenomena," etc.

Nearly sixty thousand copies of Dr. Hudson's previous book have now been sold, and his new book, which deals in a bold and original way with a subject which is attracting universal attention, will prove an even greater success. ($1.20 *net.*)

AN INDEX TO POETRY AND RECITATIONS

BEING A PRACTICAL REFERENCE MANUAL FOR THE LIBRARIAN, TEACHER, BOOKSELLER, ELOCUTIONIST, ETC.

Edited by Edith Granger, A. B.

This will undoubtedly prove to be one of the most useful reference books ever published. Over 300 standard and popular collections have been indexed, comprising nearly thirty thousand titles, arranged alphabetically under three heads—titles, authors, and first lines. ($5.00 *net*)

EUROPE 8TH SUMMER. Few vacancies in select and small party organized and personally conducted by Prof. C. THURWANGER, New England Conservatory of Music, Boston.

AN EDUCATIONAL DIRECTORY

I.—The NATION stands alone in its field. It has a larger circulation than any politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in the NATION has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States alphabetically, unless especially ordered displayed.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The NATION is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

THE NATION, 206 to 210 Broadway, N. Y.

NEW BOOKS RECENTLY ISSUED

A FEW OF HAMILTON'S LETTERS

By GERTRUDE ATHERTON
Cloth, $1.50 net.

Mrs. ATHERTON's aim in collecting the letters of Hamilton has been to enable Hamilton's admirers to form a much more close estimate of his character than is possible from almost any other source. He wrote so freely and intimately that his letters afford many personal revelations of the man, and his lovable human nature. It is, as it were, a companion volume to "The Conqueror," the novel in which Mrs. ATHERTON drew her masterly portrait of her hero.

HEREDITY AND SOCIAL PROGRESS

By SIMON N. PATTEN
University of Pennsylvania.

By the author of "The Theory of Prosperity," etc. The issues of the book are clearly presented in the following questions: How is the social surplus of an epoch transformed into permanent conditions and mental traits? Does progress start from a deficit or a surplus? Does education improve natural or acquired characters? Does progress come by strengthening the strong or by helping the weak?
Published this week. $1.25 net.

A HISTORY OF AMERICAN POLITICAL THEORIES

By C. EDWARD MERRIAM
University of Chicago.

This volume traces the historical development of American political theories from the colonial days down to the present time. Throughout the discussion the various types of political theory are considered in connection with the facts of American history and the intimate relation between the ideas and the environment is strongly emphasized.
Published this week.

A WOMAN'S HARDY GARDEN

By HELENA RUTHERFURD ELY

Describes a small garden prepared and planted with bulbs at small expense so that one may have flowers in blossom continually from mid-April until well into November. Charmingly simple and serviceable, the book is illustrated with many photographs of the author's garden.
Cloth, 12mo, $1.75 net (postage 13c.).

PURE SOCIOLOGY:

By LESTER F. WARD
Author of "Outlines of Sociology." *$4.00 net.*

A TREATISE ON THE ORIGIN AND SPONTANEOUS DEVELOPMENT OF SOCIETY

Its thesis is that the "subject matter of sociology is human achievement," and of the conditions and results of human achievement it treats with characteristic originality and boldness.

THE SOCIAL UNREST STUDIES IN LABOR AND SOCIALIST MOVEMENTS

By JOHN GRAHAM BROOKS

"It is the only volume before the American reading public to-day in which the views of both sides to the great social problem are set down in full fairness and candor."—*Chicago Daily News.*
Cloth, 12mo, $1.50 net (postage 13c.).

HAPPINESS ESSAYS ON THE MEANING OF LIFE

By CARL HILTY
Translated by Professor
F. G. PEABODY
Harvard University.

"That which draws readers to the Bern professor appears to be his capacity to maintain in the midst of a life of scientific activity and of important duties of public service an unusual detachment of desire and an interior quietness of mind."—*New York Times Saturday Review.*
Cloth, 16mo, $1.25 net (postage 7c.).

THE CAMBRIDGE MODERN HISTORY Vol. I. THE RENAISSANCE

Planned by the late LORD ACTON; *written by nineteen of the most eminent of English historians.*

"There can be no question about the great value of the work—in fact, it is invaluable to every historical student."—*The Public Ledger*, Phila.
Vol. I. Cloth, 8vo. 927 pp, $3.75 net (postage 29c.).

DEMOCRACY AND THE ORGANIZATION OF POLITICAL PARTIES

With a Preface by JAMES BRYCE

By M. OSTROGORSKI
Translated from the French by FREDERICK CLARKE.

"In the fullness, accuracy, and painstaking care with which it was prepared it takes rank with Mr. Bryce's 'American Commonwealth.'"—*Philadelphia Press.*

The Nation.

NEW YORK, THURSDAY, FEBRUARY 26, 1903.

The Week.

The Supreme Court's decision in the lottery cases was handed down on Monday—regrettably, by a closely divided court—and marks a new affirmation and exaltation of the power of Congress over commerce of all kinds between the States. Those who have asked whether the power of Congress in that particular has been exhausted, are now answered definitely that it is not. Under this decision, it extends absolutely to all forms of commerce to which the people, acting through Congress, will that it be extended. That is the gist of the prevailing opinion. It goes frankly to the length of asserting that the power to "regulate" interstate commerce is the power to prohibit it altogether. "May not Congress," asked Judge Harlan, in the majority opinion, "for the protection of the people of all of the States, and under the power to regulate interstate commerce, devise such means within the scope of the Constitution and not prohibited by it as will drive the traffic out of commerce between the States?" His answer was decidedly in the affirmative; and the finding of the Court was that,

"under its power to regulate commerce among the several States, Congress—subject to the limitations imposed by the Constitution upon the exercise of the powers granted—has plenary authority over such commerce, and may prohibit the carriage of such tickets from State to State; and that legislation to that end and of that character is not inconsistent with any limitation or restriction imposed upon the exercise of the powers granted to Congress."

But if individuals may be penalized for sending lottery tickets across State lines, and express companies punished for carrying them, corporations may be penalized for engaging in any other form of interstate commerce which Congress may deem to be pernicious, and railways may be fined and otherwise punished for acting as their carriers. In other words, we have in this decision of the Supreme Court an explicit answer to the question which Attorney-General Knox asked in his speech about Trusts in Pittsburgh on the 14th of last October. This was whether Congress might not so extend the Interstate Commerce law as to destroy monopolies by prohibiting the distribution of their products. Mr. Knox openly put the query whether, in such a case, the Supreme Court would not hold that the power to regulate implied the power to prohibit. The decision in the lottery cases gives him his answer. If Congress chooses to pass an act excluding any class of goods from interstate commerce, the Supreme Court will not declare it unconstitutional.

Judge Grosscup's decision in the so-called Beef Trust case amounts to a bare statement that the acts of the combination of butchers and packers, the defendants in the case, fall within the terms and prohibitions of the Sherman anti-Trust act. This is the act of July 2, 1890, "to protect trade and commerce against unlawful restraints and monopolies," the penalty for violating which is a fine not exceeding $5,000, or imprisonment not exceeding one year, or both, in the discretion of the court. The acts of which the defendants have been guilty, as the court finds, consist in an agreement to refrain from bidding against each other in the purchase of cattle; in bidding up the price artificially to induce large shipments, and then ceasing from bids in order to depress the price; in agreeing upon the prices and quantities of meats to be shipped, and generally in suppressing competition in the meat trade. These acts are certainly prohibited by the Sherman law in all cases where they relate to commerce between the States. Moreover, the Sherman act itself has been passed upon by the Supreme Court, and held to be Constitutional in terms broad enough to embrace the questions at issue before Judge Grosscup. Although grounds for an appeal may be found, there is little doubt that the present decision will stand, and that the defendants will be liable to fine and imprisonment if they repeat the acts which are now enjoined by the court.

To infer that an act which is prohibited by law and enjoined by the courts will not be performed, would be contrary to experience. In this case, there were large profits to be obtained by a combination of the butchers and packers to put an end to competition in the buying of cattle and in the selling of meats. The men in the combination do not consider it wrong to make such an agreement. They see dozens of other combinations operating on the same principle, some of which are more extensive than their own. They are prompted by the prospect of gain to find ways to circumvent the law, and they are not restrained therefrom by any moral consideration. The Interstate Commerce act forbids the making of secret rates and the giving of rebates by railway companies, yet the law has been systematically and continuously violated from the day of its enactment till a very recent date, and is probably violated in some parts of the country now. One of the complaints against the beef men was that they were receiving secret rebates from railways. Are we warranted, then, in supposing that the beef combination will be broken up, or that the acts complained of will cease, merely because a Federal judge has issued an injunction against them? It would be contrary to all that we know of similar combines to suppose so. What form the beef combination will next take we cannot foresee, but it may be a combination like the Sugar Trust or the Steel Trust. The amount of money at stake is too large to be surrendered at the end of the first engagement.

If the Senate of the United States likes being taken publicly by the throat, as it is now in the sight of the whole country by Quay and Morgan, we do not see that any one need waste pity on the way it is being brought into contempt. It is an old story for Quay. At least twice before he has plucked the venerable Senate by the beard and forced it to surrender. Once it was in order to prevent some constituents of his from having to take a contract for ship-armor at a lower rate than they desired. The other occasion when he played highwayman and compelled the Senate to throw up its hands was at the time of the passage of the tariff bill of 1894. With the rules wide open for such unscrupulous abuse, what is to be expected when the unscrupulous man comes along to take advantage of them? Some way out of this particular crisis may be found. Senators hate an extra session as schoolboys hate being kept after hours; and they will move heaven and earth to avoid it. But the opportunity to strangle public business in the interest of private scheming will remain as long as the Senate refuses to adopt rational rules of procedure. By whatever door you go in, there you always come out. In the public interest, as well as for the sake of its own self-respect, the Senate should conform to the usage of deliberative bodies in all civilized countries, and not remain at the mercy of any obdurate or piratical member, or of a tireless *vox et præterea nihil.*

The ice gorge in the Senate becomes tighter and more perplexing every day. Included in the mass are three financial measures of importance—the Aldrich bill for the deposit of public money in banks, the Philippine currency bill, and the Fowler bill. The first is the one of most importance at this juncture, and the most likely to pass without delay if reached. It is a measure to enable this Government to do what all other governments do—to put the unused portion of its daily collections in places where it will be at the service of the business community. If all the railroads in the country should adopt the practice of putting their gross receipts in a cavern, paying out only the amounts needed for

operating expenses and lending their surplus only on United States bonds as collateral security, the situation would be substantially what we now have, and everybody would pronounce it idiotic. Now that a bill for a more rational system has been reported by competent authority, people are wondering why we have not amended it long ago, and why we ever endured the cavern system at all. The answer to the latter question is that there was a quarrel in Washington three-quarters of a century ago which resulted in the Sub-Treasury system—a political quarrel, not a financial one—and that although every vestige of the old quarrel has disappeared, the Sub-Treasury system has never been changed. This fact attests our conservatism rather than our common sense. The Aldrich bill will pass if the ice gorge in the Senate breaks, or if it can be extricated from the mass, since nobody is really opposed to it. The Philippine currency bill is not in so good a position. Here the two houses are in conflict with each other, and, in addition to the original causes of variance, a new one has been added in the form of a plan for a new international silver conference, which the Senate has added as an amendment, but which the House Committee has rejected. If the Philippine bill fails completely, its loss will be due to this amendment.

There is point in Senator Burton's sarcasm about the need of having a "committee on publication" in connection with the secret sessions of the Senate. The profound secrets of the Senate's executive sessions leak out as promptly and regularly as those of a gossiping village tea-table. They are as constantly telegraphed, and with as much accuracy, as the ordinary proceedings of open sessions. Senators are, of course, on their honor not to "divulge," but they really blab everything like so many school girls. Moreover, there is a continual controversy over what is executive business of the Senate and what is not. The habit is growing upon the more irresponsible members of blurting out their views on all subjects, supposedly covered with a veil of secrecy or not. When they themselves thus treat the secrecy of the Senate as an absurd survival, why should the public preserve any respect for it? The truth is that it is necessarily outgrown with the growth of the Senate. The form may be maintained, but the substance is gone. You might as well expect a town-meeting to be really secret as the Senate.

Whatever else may be said of President Roosevelt's negro appointments, it is obviously beside the mark to say of them that they are made in order to win votes in the next Republican Convention. We had supposed it to be so plain that votes would be lost, rather than won, that we were surprised to find a speaker at the Maryland Society dinner on Friday night accusing the President of delegate-hunting in the South. He must be wholly unaware of the revived Hanna propaganda and its rationale. That the Ohio Senator will have nearly all the Southern delegations at his disposal is the understood thing in Washington. He never affronted Southern sentiment, and angered the Republican machine in the South, by naming educated and independent negroes for office. Mr. Hanna gave them his political riff-raff, black and white, and the South took that as a matter of course. What has inflamed race prejudice anew is not negro appointments *per se*, but high-class negro appointments. When Mr. Roosevelt singles out a few colored men who have made themselves intellectual and moral leaders, and bids negroes take them as models, the spirit of caste is mightily stirred up. The brutish, unaspiring black man it does not mind, but the recognition of the negro who has risen fills it with unreasoning fear.

A circular requesting Southern negroes to contribute to a fund to promote Senator Hanna's bill for pensioning ex-slaves bears as its only evidence of good faith its rhetoric, which is unmistakably African, and not that of the Republican headquarters. This appeal is issued from "the Supreme Headquarters of the Ex-Slave Mutual Relief Association," etc. It is signed, among others, by a "supreme national deputy promoter." It asserts that Mark Hanna is "a man of might and power," and (the single lapse into the common political style) that "victory is perched on our banner." All that is needed to make this perch a permanent roost is the slight contribution by all persons of color of a dollar, to be used "in the agitation of our causes." Agreeing with the circular that Senator Hanna is a man of "might and power," we assume that he will use every effort to expose and expel this fraud which is perched on his pension bill.

Mr. James Breck Perkins, Representative in Congress from the Monroe district of this State, and a supporter of tariff reform, is not without honor in his own city and party. He is a Republican of the stalwart kind, but he does not advocate duties on articles which need no protection. He does not make the tariff a fetish. He has introduced in Congress a bill to place lumber, coal, beef, and hides on the free list, and in doing so he made an appropriate speech which has received the cordial endorsement of the Eighteenth Ward Republican Club of Rochester, who have given him a vote of thanks and an invitation to a public reception at some date to be fixed by himself, soon after the expiration of his present term of office. Mr. Perkins is the best type of the scholar in politics. He did not find it necesary to lay aside any part of his manhood when he accepted a renomination, or any part of his convictions after he was elected. It is encouraging to perceive that his constituents stand by him. Mr. Perkins will be a member of the next Congress also.

Gen Grosvenor's latest attempt to serve the Shipping Trust has brought him and it only fresh disappointment. His own Committee would have none of him, or of his unblushing scheme to help the Shipping Trust pay for the English ships which it bought at three times their value. Subsidies have always a suspicious air, but when it comes to voting doles to a gigantic combination of which foreign governments stand in awe, we touch the very sublimity of shameless greed. That the dose was too much for some of Grosvenor's Republican associates is matter of congratulation. They have killed the bill, not only for this session, but, as we believe, for all time. The Shipping Trust will have to sail on its own bottom.

The preponderance of evidence leads us to believe that the trade of the country has actually outrun its means of transportation, and that the shortage is not merely of cars and locomotives, but of trackage as well. New calls are constantly made upon the money market for means to enlarge the facilities of existing railways. The most significant of these is the recent announcement by the Pennsylvania Railway Company of its purpose to double its capital. The freight blockade on this railway has been so severe and protracted that the company has been obliged to discontinue its fastest train to Chicago. Surely nothing but dire necessity could have dictated that curtailment of its passenger traffic. With the approach of spring the abnormal demand for coal will cease, and we shall then be better able to judge whether the freight blockade is temporary or permanent. If it turns out to be persistent, it will supply the advocates of canal enlargement in this State with an argument far more weighty than any which they have yet employed. Heretofore they have urged the necessity of an enlarged waterway in order to regulate the rates. If it shall appear that the facilities of existing railways are not sufficient for the prompt movement of the freight offered to them—in short, that the demand for transportation exceeds the supply—then the public demand for an enlarged canal will be more imperative than before. We incline to the opinion given by Professor Sumner of Yale that the present prosperity of the country, of which the freight blockade is the most striking symptom, is likely to go on unchecked

for some time to come because it results from the development of natural resources.

In several States besides Vermont, local-option sentiment is making headway. A thousand citizens of New Hampshire, many of them former advocates of prohibition, appeared before the House Committee on Liquor Laws at Concord a fortnight ago to urge the repeal of prohibitory laws. In Tennessee, another State where the liquor question has been a very live issue, the situation is somewhat peculiar. A general local-option law, which had passed the House, was rejected by the Senate, but both houses concurred in a law which is, in effect, an extension of the local-option principle. Under its provisions any town of more than 2,000 population can become "dry" if it gives up its charter and reincorporates. A number of cities, including Gallatin, Union City, and Trenton, have at once taken steps to avail themselves of this privilege. Still farther South, in Mississippi, Bishop Galloway's declaration for local control of the liquor traffic has caused wide discussion, for the Bishop in former years was the head and front of the prohibition cause in the State. "There are those who assert that the distinguished churchman has sounded the death-knell of statutory prohibition in Mississippi," says the Jackson *Clarion-Ledger*. "There are many others who hope and trust that it is true."

Close upon the sensational debt-collecting expedition of England and Germany, follows an award of $700,000 to American claimants, made by the highest Venezuelan court. The decision was highly honorable to the judges, for the case was that of a concession granted by a previous government and subsequently revoked in part. A verdict for the claimant, under these circumstances, seems to show that foreigners may count upon receiving justice in Venezuela. The English and German Governments, which have acted upon the contrary theory, would doubtless hold that recent events have expedited the course of Venezuelan justice. But diplomacy is bound to consider not motives, but facts; and the present fact bears out the reply of the Venezuelan Foreign Minister to the British ultimatum of December 9. Dwelling upon the financial difficulties arising from the state of civil war, the representative of Venezuela said:

> "When peace is declared, which will be soon, there will be no need to remind the Government of the republic to fulfil its financial engagements, because it is well aware of its duty in this respect, without any necessity for pressure or coercion which are contrary, as your Excellency will understand, to the laws of mutual respect and healthy cordiality."

"Smooth words," a cynical observer might object; but which is the inferior nation?

There is a delightful and mathematical simplicity in President Castro's method of meeting his payments under the protocol. His creditors are to take 30 per cent. of the customs receipts. *Caramba!* he raises all the duties 30 per cent., claps on an export duty, and stands pat—all this by decree. Certainly President Castro needs the aid of Mr. Carnegie or any other Teutonic financier as little as he craves the praise of the German poets. Tariffs, however, refuse to be governed by axioms, and it is perfectly possible that he will find that 30 per cent. of his new whole is less than 30 per cent. of his old part. But pay he must somehow, and doubtless will cheerfully, for he has made a stir out of all proportion to his own importance or that of the nation upon which he has imposed his rule.

In the British Parliament on Friday it was brought to Mr. Balfour's attention that thirty-three of his Cabinet Ministers held sixty-eight company directorships. He brushed aside the insinuation with rather more than his usual jauntiness. "Why not?" he said. "I have absolute confidence in my colleagues' devotion to the public service. Only on the basis of absolute confidence in Ministers can the business of the country proceed." Mr. Balfour cannot have meant that a Minister should retain any business position which might tend to influence his official action. He would undoubtedly find an impropriety in the appointment, for example, of Mr. John D. Rockefeller to be Secretary of our new Department of Commerce, or of Mr. C. H. Cramp to be Secretary of the Navy, while he would probably defend Secretary Root's five directorships in various trust companies, etc., on the ground, first, that the companies with which he is connected have no interest in the administration of the War Department, and, second, that there was no question of Mr. Root's complete devotion to the public service. One might accept this view in the individual instance and still dissent vigorously from the argument that it is proper for any Cabinet Minister to retain an active connection with any business that is likely to be the recipient of special favors from Government. Mr. Balfour's demand for plenary confidence does not meet the case. One may freely admit, say, that the American Surety Company, in which Mr. Root is a director, might some day serve the Government as J. P. Morgan & Co. did in connection with the public loan of 1898, and yet no suspicion of any sort attach to Mr. Root, without admitting that a Minister ought to be put in such a position. And even Mr. Balfour would hardly contend that such an affair as the Kynochs scandal of last March (in which it appeared that Mr. Chamberlain's enterprising kinsmen had traded in his prestige as well as in lyddite at an extortionate price) is wholly consistent with any theory of confidence in the Ministerial character.

No Cabinet Minister will go far wrong who follows the example set by Bismarck. The Machiavellian Chancellor, Mr. Sidney Whitman writes in his recent 'Personal Reminiscences,' once found himself during critical negotiations with Russia a large holder of Russian bonds. These he promptly sold, although a firm believer in their value, at a considerable loss. His explanation of the act was the simplest: "I did not think it consonant with the etiquette of my position as German Chancellor to be personally interested in Russian stocks at such a critical juncture." *A fortiori*, he would hardly have connected himself with the management of a public service corporation at any juncture.

In his characteristic way of taking all knowledge for his province, the Emperor William has been enlightening his anxious subjects in the matter of Christian theology. For a man of whom it might be said that knowledge is his forte and omniscience his foible, it must be said that his deliverance does not seem very impressive at this distance. It reminds one too vividly of Pascal's pleasantry, "Je suis devenu grand théologien en peu de temps, et vous en allez voir des marques." The Kaiser merely echoes the ordinary utterance of the higher critics of the Old Testament. They assert, as stoutly if not as dogmatically as he, that modern investigation does not touch the essentials of religious faith. Very likely not, in their minds or in his; but it cuts at the root of popular theology, beyond any question, and that is what the row is all about.

Many times before the present the Porte has accepted European demands for reform, and reform has gone no further than acceptance. Accordingly, the rumored acquiescence in the Austro-Russian stipulations has changed the situation only to this extent, that the Sultan has shown that he does not desire war. The programme of reform—the appointment of an "inspector" over the Macedonian and Albanian provinces, the re-officering of the local troops with European nominees, and the recruiting of the soldiery from the Christian as well as the Muslim population—would do much to relieve the situation, it it were honestly put into effect. But who believes that the Sultan will actually place the troops on his northern frontier under Christian officers, or dilute his Turkish forces with Grecian and Bulgarian recruits?

REPUBLICAN CONSISTENCY.

Thackeray once took off his hat in the Reform Club, and bowed low to John Bright, who was passing. When asked why he did it, he said that he wished to express his reverence for "the most consistent statesman whom I know." Could he, or any other independent moralist, salute the Republican party today for a like reason? In the fundamental policy which gave it birth, and which it still professes to advocate—equal rights for all, white or black—has it to-day that clear and consistent attitude which alone can nerve its arm and make its moral port impressive?

We are moved to ask these questions in view of current discussions of the negro question in this country. In one way and another it has come rapidly to the front in the past few weeks. At public meetings of various kinds, in many pulpits on Washington's Birthday, the issue of the negro's political rights has been made the theme of debate. We shall certainly hear much more of it. Politically, the subject of negro disfranchisement in the South is bound to have great prominence in the next Congress. In many Republican quarters we hear again the old clear note of human liberty. The President's attitude, with that of the Senate, in the case of the few select negroes whom he has named for Federal office, has aroused thought and provoked an agitation which bids fair to go to the root of things. It almost seems as if the old moral fervor of the Republican party, in all that relates to human rights and equal opportunity, might be rekindled.

Just as the flame begins to leap up, however, a wet blanket is cast upon it. It is thrown by the Southern challenge of Republican sincerity. At the very moment when Northern speakers and preachers, taking courage from the President's bold stand for fair play for the negro, are beginning to reassert the old doctrine that all men are equal in the sight of God, and should be made equal before human law, an overwhelming retort comes from the South. It was put into words at the dinner of the New York Southern Society on Saturday night. One of the speakers, Mr. Braxton of Virginia, denied that the white men of the North really believe in the Fifteenth Amendment. The moment, he said, it was proposed to apply that doctrine of the political and legal rights of an inferior race—to apply it logically and all around—the "loudest advocates of it in the North stood aghast and retreated." They shrank from enforcing it, the speaker said, in "our new insular possessions." There they frankly accepted what the majority of white men in the South accept—namely, the right of a superior race to do as it will with an inferior race. With what face, then, can the Republican party reproach the South, or go to work to penalize it in the matter of representation in Congress, for doing just what a Republican Administration has been doing as a matter of course in another part of American territory?

There is more involved than mere political consistency. That may be explained away, or ignored, or got over. But human rights cannot vary, under the same flag and the same Constitution, with degrees of either latitude or longitude. If we are going to breathe again the aspirations of a Gov. Andrew, or a Sumner, or a Lincoln in behalf of the black man, we cannot omit to do it for the brown man. If we mean to insist that the negro be allowed to rise, we cannot put fetters upon the Filipino who has risen. Unless our skirts are clear in Manila, we cannot assume moral indignation towards Charleston. This is a truth which the Republican leaders cannot for a moment afford to forget. They cannot enter upon a struggle for equal rights at home, and the suffrage and an opportunity for the poorest negro, without being ready to concede in the Philippines what they demand in the South. There are subtle affinities and deep-lying unities in all this great matter which we should hope have not escaped the attention of President Roosevelt. Where has he had his warmest support in upholding the cause of the negro, as a man for a' that? Precisely from those men and newspapers that have steadily opposed the new policy of conquest and enslavement in the Orient. It is the Imperialist Republicans, the exploiters and dominators, who ask impatiently why Mr. Roosevelt wanted to go and make such a row about a few negroes in office. They would be quite content, and consistently enough, to have the inferior race in the South robbed of its political rights as coolly as the Filipinos have been, and to say that anybody who objects is a marplot, and a fomenter of "trouble between the races."

What do serious men mean when they speak of superior and inferior races? They surely cannot mean the accident of color. A colored man himself, Mr. Booker Washington, gave on his namesake's birthday a definition that puts all such unreal distinctions to shame. The superior race, he said, is that which has "learned to exhibit the greatest patience, the greatest self-control, the greatest forbearance, the greatest interest in the poor and unfortunate, and has been able to live in a high and pure atmosphere and dwell above hatred and acts of cruelty." That must be always the measure, not the mere chance superiority of position or power. Those who now boast themselves of belonging to a race which is superior *per se*, would do well to look to the pit whence they were digged. They should re-read what Tacitus said of their ancestors in the swamps of Germany, and recall the truthful words of Pitt: "We Britons were once as obscure among the nations of the earth, as savage in our manners, as debased in our morals, as degraded in our understandings, as those unhappy Africans are at present." Such considerations show what the argument of race evolution amounts to. Superiority is nothing but superior achievement, and achievement depends upon opportunity and liberty. They, however, mean the same thing in the Philippines that they do in the Southern States, and cannot be secured to the negro if they are denied to the Tagal.

"UNANIMOUS CONSENT" IN THE SENATE.

In the course of the sharp interchange of epithets in the House last week, when the conference report on the Army Bill was under debate, Congressman and Speaker-to-be Cannon made a remark about the Senate's methods of transacting business. The Senate, he said, "passes all bills by unanimous consent; and gentlemen know what that means." At the very moment, Senators were themselves struggling, at the other end of the Capitol, with the question of their own parliamentary rules. Ought they to adopt the closure, or ought they not? Should their presiding officer be clothed with the powers which are inherent in the office of every other presiding officer known to man—the power to make debaters discuss the question before the house and speak to the point—or should the present system be continued, and the public business be put at the mercy of every leather-lunged Senator who takes and holds the floor for a week or a month, as he pleases?

The existing plight of the Senate would certainly seem to call for some heroic remedy. Old traditions have received blow after blow. The snug little privy council has grown to a body of ninety members, and some of them delight to trample upon the ancient amenities. The "courtesy of the Senate"—what a sarcasm lurks in the phrase, with Quay and Morgan just now posing as chief pinks of politeness! The Pennsylvania Senator is as courteous as any gentleman burglar that ever flashed a dark-lantern in the face of his victim, but he is also as audacious and relentless. He keeps his grip upon the throat of Senate business, in defiance of the leaders of his party and of the weightiest judgment of the Senate. Apparently nothing can shake him loose. And Senator Morgan blithely sets out to deliver large sections of the history of the world, under the guise of a speech against the Panama Canal Treaty, with the frankly avowed object of talking to death a measure which an overwhelm-

ing majority of his colleagues are eager to vote for at once.

One would say that the situation must seem intolerable to the men who suffer from it. But no—they like it! Their discussion of the question of a change in the rules made it clear that no change can yet be made. Unlimited debate would surely ensue upon any proposal to limit debate. Much was gravely said about the sacred duty of preserving in this wicked world one "forum of open debate." If it were really debate, we might say amen. But not even the courtesy of the Senate can call that debate which is plainly obstruction, or pretend that the country is any more interested than the empty seats in the Senate chamber are in the prosing of a Depew inventing history as he goes along, or in the continual dropping of a Morgan through nine times the space that mortal men call day. An English Chancellor, once, observing a tedious Lord yawning in the midst of his own speech, remarked in an aside, "Really, the fellow begins to show some taste. But he ought to leave that to us." Certain it is that the Senate and the public have long yawned portentously at the time-destroying and patience-exhausting methods tolerated by the Senate rules. Why, then, do the powerful leaders of the Senate cling to them so tenaciously?

The real reason is that they know that their control of the public business, and so the consolidation of their own power, depends upon a continuance of the present system. Senator Lodge came pretty near confessing the truth when he said that, complain as you will, the fact remains that the majority of the Senate always has its way—or, rather, he added, "a majority of the majority." He put this in to forestall the retort of Senator Quay, who has an apparent majority of the Senate at his back, but not a majority of the majority party. Tested by the history of bills in the Senate, Lodge's statement is quite wide of the fact. Many laws have been passed, or have failed to pass, in spite of the wish of the majority of the dominant party—the repeal of the silver-purchase act, in 1893, for example. But the Massachusetts Senator was, after all, close upon a revelation of the truth. His words pointed to the rule of an oligarchy, and precisely such a rule it is to which the Senate is now subject. In the hands of a half-dozen Senators, more or less, lies the shaping of the great measures of legislation, the decision which shall pass and which shall die, with a command over even the minor bills which very few on the outside suspect.

Now, what is it that gives to this handful of men such enormous power? Is it their superior judgment, their ability in debate, their weight of moral character? The answer is clearly in the negative when we say that Senator Aldrich is the most powerful of these all-powerful leaders. What they grow great upon is seniority in service and the consequent favored committee positions; and the very chaos of Senate procedure they rely upon to give them their great advantage of control. This is what Mr. Cannon meant when he said that business in the Senate was transacted by unanimous consent. Everybody has first to be "squared." When Senator Aldrich politely rises to express the hope that there will be no objection to his bill to rearrange the finances, or what not, "gentlemen know," as Congressman Cannon said, what lies in the background. There lies a perfected system of *do ut des*. The "steering committee" has bought off all objectors. It has flung them this public-building bill or that private-pension claim. In that way the leaders arrange the affair and complete their control. Hence we see why they wish no efficient rules of debate. The greater the confusion, the more prolonged the delay, the more extreme the crush of business, the more imminent the failure of bills necessary to carry on the Government, the finer their opportunity. They ride the whirlwind and direct the storm—all in the secrecy of their committee rooms—and do it by apportioning to each Senator his meat in due season, not forgetting a generous share for themselves, since they, having to work harder than their fellows, naturally have more voracious appetites. That is the real meaning of "unanimous consent" in the Senate. Unlimited debate places unlimited power in the hands of an oligarchy. That is the ultimate fact which must be taken into account in all discussions of the Senate's absurd rules.

M. QUAY, REFORMER.

At last reform has triumphed in Pennsylvania. The delay has been long and disheartening. We confess that there have been times during the last ten years when we seriously wondered whether the spirit of independence could ever be awakened in that State. Political crimes which would have aroused the people of almost any other commonwealth to frenzied activities, have brought forth but languid protests in Pennsylvania. When, a couple of years ago, the Common Council of Philadelphia, acting under temporary authority granted for the purpose by the Legislature, voted away, for nothing, franchises for which a single citizen offered to pay two million and a half of dollars, we did think that some semblance of public spirit might be awakened. A number of Philadelphia newspapers spoke out quite boldly, after that grab, and a Citizens' League began to organize a movement which was at least hopeful. But it came to nothing. Too many men of light and leading held stock in the ring speculations. The usual machine victories were recorded. The reform forces disintegrated. Men shook their heads and said it was impossible to defeat the Republican gang. There was no leadership, they said.

But all this is changed now. Reform in Pennsylvania has a leader. He is experienced, he is resourceful, he knows a "useful" man when he sees one, he is not unknown to fame, and his name is Quay. He has been in the reform business now more than a year. It began with the Governorship. A former Quay henchman aspired to this high office, and brought as his credentials a long list of services duly rendered. But Quay would not hear of it. Some said that he feared the growing power of the Harrisburg ring, but we now know that Quay had determined that only good men should hold high office. The former henchman became defiant, but this only intensified Quay's devotion to his new ideals. Judge Pennypacker was nominated for Governor, and all the anti-Quay Republicans rushed to his support. It was a famous victory. During the campaign Mr. Pennypacker announced his opinion that Quay was a greater man than Webster or Clay, and in his inaugural address he administered a stern rebuke to those who heedlessly criticise great men, Senators and the like. Thus was Quay early rewarded for donning the garments of virtue.

And, finding them becoming, he continues to wear them. There was talk of a Citizens' candidate for Mayor in Philadelphia this winter. Mayor Ashbridge's administration had exhausted the patience even of those Philadelphia patriots who annually, by electing thugs to office, "uphold the hands" of McKinley or Roosevelt, or whoever it happens to be. Durham, the Quay leader in Philadelphia, might not have minded such a movement, for he is resourceful in the lower wards, but he did not know his Quay. When it was announced that District Attorney Weaver would be nominated for Mayor, it was seen that all need of a Citizens' movement was thus avoided. The Municipal League indorsed him. He was elected on Tuesday week by the splendid plurality of 136,000, and it is estimated that in many wards far more votes were cast for him than there are voters.

So also in Pittsburgh. Quay, the Boss, had long been troubled by political conditions in that city. In fact, he had been quite unable to prevent the success there of Republican leaders hostile to himself. But Quay, the Reformer, has no such difficulty. Mr. Hays, the Citizens' candidate, was triumphantly elected Mayor there last week. Nothing disturbs the complete satisfaction which all good Americans must feel in this result, except some proofs, inconveniently made public, that several of the local news-

papers were bribed by Quay's friends to support Hays.

One of the best things about a reformer like Quay is that he is industrious and practical. We all know the stuff the average reformer is made of. His head is in the clouds, and he does not attend to details. He gets a bill introduced in the Legislature, and forgets to appear in favor of it before the committee at the hearing. He has absurd scruples against adopting time-honored methods. Quay is hampered by none of these defects. The returns of February 17 show no weakening in the Philadelphia wards which increased their Republican vote from less than 2,000 in 1900 to more than 5,000 in 1902. The increases since 1902 have perhaps not been quite in proportion, but the standard has been maintained. In no case has the vote been permitted to sink back into any relation whatever to the population. Everything seems to have been thought of and attended to. In short, Quay has demonstrated that he is efficient. This is the highest praise for a reformer. Of course, under present circumstances, Pennsylvania's good citizens will consent to give up one plan which formerly interested them: they used to talk of a personal registration law as a means of fighting Quay. Now that Quay is one of them, the whole thing seems unnecessary. This opinion, we understand, is shared by no less an authority than Quay himself.

THE PLIGHT OF ST. LOUIS.

All students of politics and lovers of good government should read an article by Mr. Lincoln Steffens, in *McClure's Magazine* for March, which is rather startlingly entitled "The Shamelessness of St. Louis." Why St. Louis should be considered shameless above other cities that have let themselves be governed by scoundrels, will appear when it is noted that in St. Louis alone has the cycle of political corruption swung full, producing upon the machine and the quiet body of honest citizens alike its inevitable disintegrating result. In no other instance, on a large scale, has the machine been allowed to run its entire mortal course unhindered. New York cut down her Tweed in his heyday, and made it too hot for Mr. Croker before his dominion over the machine had fairly been shaken. Minneapolis has routed her boodlers, and is now dragging back ex-Mayor Ames to trial and apparently to certain punishment. In Philadelphia, perhaps, the powers of corruption have fortified themselves against internal dissension. But in St. Louis we have a complete and probably a unique example of ring government in its dotage and public opinion in its decrepitude.

How such demoralization has afflicted a proud city may be learned in Mr. Steffens's scornful pages. The "boodle" ring was like any other ring. Col. E. R. Butler and his associated "good fellows," during and after the year 1898, got control of the city government, and began a careful sale of illegal privileges. Gradually becoming stronger, they began to charge a tariff for all the services that the city was bound to render to the citizen. If a railroad wanted a switch, a financial house a franchise, a householder a permit to dig in front of his dwelling or for his block to be lighted—any of these ordinary rights had to be paid for handsomely. The holding up of corporations became a business, with its rules of procedure and etiquette. If there was a certain brutality in keeping the city dark for weeks until the bidders for the lighting contract had "come up" with $175,000, there was delicacy in the action of Councilman Uthoff, who, holding the boss's retaining fee of $25,000 to fight a traction contract, refused indignantly $50,000 from the contractor, finally accepted $100,000, and the next day returned the $25,000 to Boss Butler, because he "had not earned it."

This transaction is typical, and pointed to the dissolution of the Butler ring, which was already in a bad way with fatty degeneration before Circuit Attorney Folk took a hand. Col. Butler's gains were inordinate, and at the very time when he was making a mockery of party government by naming both Republican and Democratic candidates, his own fellows, weary of dividing a tithe against the boss's nine-tenths, began boodling on their own account. Butler was powerless to stop the mutiny; apparently he hardly cared to stop it; for when the sale of franchises and other city assets was running up to $50,000,000 worth, there was boodle enough for all. Great plans were on foot—the sale of certain markets and the transfer of the city water works to private hands. The rival "honest brokers" of franchises began to expose each other, and even to take legal proceedings that revealed wholesale bribery. A great mass of evidence against the ring was becoming accessible, but nobody cared to use it. The Republicans and Democrats, honest citizens generally, went on stolidly "voting the regular ticket," as the boodlers themselves uncovered the corruption of both parties. And this is the really appalling feature of the situation, as Mr. Steffens depicts it, that just as the machine was rickety from its own riotous living, the capacity for moral indignation which might have shattered it once for all was departed from the city.

One man did care, as everybody knows. Single-handed, Circuit Attorney Folk hammered at the ring, if he could not destroy it. Nobody knew much about him when the politicians nominated him. Certainly nobody suspected that he would fight the boodlers. It occurred to neither Col. Butler and his gang nor to the honest citizens of St. Louis that the boodlers could be fought. The sheer accident that a courageous man, who believed in the law he administered, was elected by the piratical fraternity, alone could have led to the exposures that now are a household tale. This mishap might easily have been prevented had it been anticipated, and to-day, while Col. Butler lies under conviction for bribery, his candidates are returned by the city of St. Louis, his creatures, frequently under conviction for crime, are kept by the law's delays in the City Council and State Legislature, and in Mr. Steffens's opinion the activities of the ring are merely suspended—for from this temporary discomfiture it may learn valuable lessons in the matter of making the power of public plunder genuinely cohesive.

New York certainly has little right to assume airs of superior righteousness, but has much to learn from St. Louis. There was, two or three years ago, every probability that the more astute members of Tammany Hall would improve upon the old Platt-Croker alliance and control both the Republican and the Democratic organization. This process, of which there were only indications in New York, was actually accomplished by the St. Louis boodlers. Furthermore, there have been signs that both the inner Tammany ring and the police "system" have been going stale. The disproportionate gains of Croker and Devery were undoubtedly causing jealousy, and might have produced revolt. The inner rottenness of Tammany Hall was likely to impair its strength, just as the shamelessness of the franchise-jobbers of St. Louis made them vulnerable to Mr. Folk's attack. But the case of St. Louis shows that there could be no worse policy than to let political corruption perish of its own exceeding wantonness; for the cost of such a cure is the complete deadening of the sense of public decency. We see the city of St. Louis to-day where New York would be if its municipal salvation depended upon the single-handed efforts of Mr. Jerome. Upon him, by the way, it does depend, not beyond his deserts, but beyond all propriety. Nobody knows so well as those men who have dealt at first hand with the viler sort of corruptionist, that the only way to fight our vicious rulers is to fight them with steel, and not supinely to comfort ourselves because they are mortal and may die without issue.

THE ISLE OF PINES.

In the Senate the other day a resolution was adopted asking the President to define the status of the Isle of Pines; and last week in the House, Mr. Richardson, with that fine sense of property rights which he displayed in the affair of 'Messages and Speeches of the Presidents,' introduced a resolution declaring that this Cuban territory is lawfully

ours. But let us see about that. Under what title do we claim? What is the property, and why should there be just now this sudden eagerness to covet and acquire something that is our neighbor's?

Historically, the Isle of Pines has always been considered as much a part of Cuba as Nantucket is of the United States. Both islands lie at about the same distance from the mainland. The Cuban island, to be sure, is larger, having an area only slightly less than that of the State of Rhode Island; but it has always been held and governed as a part of Cuba. It is, in fact, a district of the province of Havana, both administratively and judicially. What possible shadow of a claim to this island, then, can the United States be supposed to have?

A tricky and indefensible claim has been set up under the Treaty of Paris. It has been maintained that the Isle of Pines was referred to in Article II. of that instrument, which recites that "Spain cedes to the United States the island of Porto Rico and *other islands* now under Spanish sovereignty in the West Indies." It would seem perfectly clear, and such we believe was the undoubted intent of the Commissioners, that this refers purely to the few small islands belonging to Porto Rico. "*The* others" is the Spanish phrase—"la isla de Puerto Rico y las demás." Moreover, the usual Spanish way of referring to Cuba is as among the Antilles, not the West Indies ("Indias Occidentales"). Language could hardly be chosen to make it plainer that Article II. contemplated exclusively the cession of Porto Rico and its adjoining islets.

But if not, and if this article of the Treaty really covered all "other islands" under Spanish sovereignty, what would follow? Apparently, that Cuba itself was ceded! Oh, but Article I. dealt with Cuba proper, providing for its "relinquishment," not cession, and Cuba's sovereignty we therefore religiously respect. Cuba was the one specified exception to the "other islands." But what a transparently shabby plea is this! If we are going to dissect out Cuba from an island that has always been considered an integral part of her territory, why should we stop with the Isle of Pines? There are more than 1,300 other islands situate off the Cuban coast; why not claim all of them? Our title to them is just as valid as it possibly can be to the Isle of Pines. They are no more a part of Cuban territory than it is; and if the latter is lawfully ours, so are the former. But this necessary consequence of the strained interpretation of the Treaty of Paris, even the predatory Richardson shrinks from facing.

Much stress is laid in addition, however, upon the Platt amendment to the army bill of 1901. The sixth section of that measure stipulated that "the Isle of Pines shall be omitted from the proposed constitutional boundaries of Cuba, the title thereto being left to future adjustment by treaty." But what, we ask, is the legal effect of that? If the Isle of Pines is ours by treaty of cession, it is sheer impudence in an army bill to propose to "adjust" its ownership. Since when did it become the fashion to cede territory of the United States, or to contemplate the possibility of its cession, in an appropriation bill? If the claim under the Treaty of Paris is valid, the Platt amendment is the most obvious *brutum fulmen* that ever issued. If not, it is only a mean and underhanded attempt to cozen Cuba out of property which is fairly her own. In any case, the Platt amendment is not of the slightest present force in the premises, since it went on to provide that its stipulations should be embodied by Cuba in "a permanent treaty with the United States." That has not been done.

The whole thing has a most ungracious look. Its being urged forward now has almost an appearance of spite. Cuba has got on in her independent life better than the wiseacres of our army believed to be at all possible. All their dire prophecies have gone unfulfilled. The island has been at peace throughout all its borders. It has a government which shows every sign of stability. The system of public schools and of sanitation which Americans introduced has been maintained; withal, by economy of administration, the Cuban Government has saved about $1,500,000 of the annual expenditure under Gen. Wood. All this ought to be highly gratifying to us. But we seize the moment to put forward a vexing and unfounded claim, as if to provoke Cuba into some act or attitude of unfriendliness. It is not a generous thing to do. We hope to see the President, with his instinct of fair play, frown upon the whole ill-timed and ill-looking movement, which we believe to be without warrant of law and are certain is without warrant in morals.

THE IRISH LAND CONFERENCE.

DUBLIN, February 1, 1903.

Public interest is at present concentrated on the report made by a Conference held between four landlords, Lords Dunraven and Mayo, Messrs. Poë and Everard, Mr. T. W. Russell, and three National members of Parliament, John Redmond, William O'Brien, and T. Harrington, with the object of proposing some means by which the land question might be settled once and for ever. The conferrers could not be called representatives, for the landlord organization repudiated beforehand the landlords who took part in the Conference; and the National members were not directly selected by the tenant farmers to represent or treat for them. A unanimous report was received with surprise, and at first with approval from both sides to the quarrel; but subsequent examination and criticism have somewhat dulled that hastily given approbation.

One of the hardest-headed landlords at once pronounced the report of the Conference "bombastic, dangerous, and empty." Public opinion is coming round to that conclusion, although the conferrers and their supporters suggest that it is treason even to criticise their proposals. Divested of its plausible bombast, the scheme appears impracticable, foolish, and unjust. Without going into details, the proposal is, shortly, that the landlords are to be secured in the receipt of their present incomes by a State payment of a capital sum producing the same income at 3 per cent. The landlords' income is defined as "second-term" rents, less 10 per cent. for the cost of collection. Second-term rents are rents which have been fixed by the land courts once after 1881, and again after 1896; and where such rents have not been fixed, the proposal is that their "equivalents" shall be the basis of compensation. But there is no explanation of how this equivalent is to be ascertained. Besides the State thus securing their income to the landlords, it is to pay them all arrears of rent up to the date of the conversion of their rental into an income from stock, to pay all the costs of proving title to their estates, and to lend them money on the security of their mansions and demesnes. The terms are highly satisfactory to Irish land owners; they exceed their wildest expectations, and, wisely, there is very little criticism from their side.

For the tenants, the terms are not quite so satisfactory, but would, no doubt, be accepted by many as an immediate and final settlement. Every tenant is to become owner of his farm by payment to the State of a terminable annuity, which shall be less than his second-term rent or its "equivalent" by from 15 to 25 per cent. This terminable annuity is to be subject to a reduction every ten years, and the occupiers of land "are to be started on their new career as owners on a fair and favorable basis." All investigations into the title of owners to sell, of occupants to buy, and the expenses of the administrative and executive machinery, are to be paid by the State.

Putting this into figures, the owner of a £10 rent, variable every fifteen years under the present law, is to be given a security guaranteed by the State which will produce £9 a year at 3 per cent.—*i. e.*, he is to get £300. The tenant, in place of being subject to the rent of £10, which, though variable in amount, is payable forever, is to become owner subject to a terminable annuity of £8, which shall be subject to periodical reductions. As the tenants' annuity will not pay the income to be secured to the landlord, nor provide a sinking fund for the gradual redemption of the stock, the Conference report suggests that "some assistance" might be given by the State. The upholders of the Conference report have been busy in the press, in speeches, in resolutions showing how this can be done without cost to any one, or what a small amount of assistance will be needed; and the discussion has in substance been as to how a quart can be got out of a pint pot. William O'Brien and T. W. Russell have explained in letters and speeches that their scheme will put no one to a penny of expense, but "no one" doesn't appear to include the general body of taxpayers.

The net rental to be dealt with under the Conference scheme is certainly not less

than 6 millions sterling. If the British Government undertook to pay the landlords in cash, it would have to raise 200,000,000 in round figures, and certainly could not get the money at less than 3 per cent. The tenants' annuities would, on the scheme's hypothesis, be about 4.75 millions, leaving a deficiency in interest of 1.25 millions, and no provision for redemption of the stock issued to raise the required funds. At 3 per cent., 2 millions a year would be required as a sinking fund to redeem the stock in forty-eight or fifty years, so that the whole charge to the taxpayers of the United Kingdom would be not less than 3.25 millions sterling a year. The report of the Conference seems based on the childish assumption that the State has unlimited amounts of money at its disposal without taking it from the taxpayers.

It is suggested that economies in the admittedly extravagant administration in Ireland might be applied to the purpose of ending the land war. But here the taxpayers' representative intervenes, asking why the money unnecessarily spent and now to be saved is to go into the pockets of the landlord class alone. Six years ago they were given £750,000 a year, or a capital sum of 25 millions, by being relieved of all their local taxation, which is now paid out of the Imperial exchequer. There are other claimants for the produce of economies in administration—education, public-health requirements, old-age pensions, the housing of the working and artisan classes, and the like. Why are the landlords to be given thirty years' purchase for agricultural rents which neither in England nor in Ireland will sell in the market for more than eighteen years' purchase? If a charge of 3¼ millions is put on the public for the benefit of the Irish landlords, who will pay it? Mainly the laboring artisan and industrial classes. Within the last five years taxes imposed on flour, corn, sugar, and coal have sensibly increased the cost of subsistence to the poorest classes. Can they and will they endure another squeeze, and will the Government venture to propose it for such a purpose? In short, as between Irish landlords and their tenants, it is proposed that for their present precarious, unpunctually paid, and diminishing incomes, the landlords shall receive an equal income from a gilt-edged stock, and that the tenants, in place of perpetual though variable rents, shall pay terminable annuities from 15 to 25 per cent. less than their present rents.

The conferrers airily say they "do not offer further recommendations upon the subject of finance, which must necessarily be regulated by the approval of the Government to the principles of their proposals." But in finance lies the whole crux. It is an easy solution of the question to propose that it shall be settled at the expense of those who have nothing directly to do with it. Michael Davitt has christened the Conference report "the Dunraven Treaty." Lords Dunraven and Mayo appear to have flattered and seduced the fiery Nationalist William O'Brien, who is now hard set to explain that he did not mean, in agreeing to the Conference report, what he appears to mean and to have said. William O'Brien and T. W. Russell have been the leaders of the movement for compulsory purchase during the last two years. Hundreds of man have been or are now in prison for echoing their words and acting up to the principles expounded by them. T. W. Russell boasted that he should be liable to prosecution in Connaught for what he has said in Scotland and in Ulster. Yet these two have given away the whole case they have been making for the last two years, by agreeing that the landlords are entitled to compensation at the rate of thirty-three years' purchase of their rental, that they have suffered heavily by the operations of the Land Acts, and that the sacrifice of sentiment involved in selling their estates should be the subject of compensation.

The political curve that O'Brien is executing may prove to be a circle, and end where he was two years ago, for he announces that, unless the forthcoming Land Bill give the tenant what he claims, he will take up arms again. Meantime his former colleagues, now his victims, are in prison: they would not be human if they did not feel betrayed, as they certainly have been forsaken, for this momentous Conference made no reference to their fate. Political prosecutions continue, and, though O'Brien has laid down his arms for the present, the Government has not laid down its arms. At best, and even on his own showing, O'Brien agreed to report in favor of more than the landlords' maximum demands, while he contented himself with asking for the minimum the tenants could expect.

To-day the Irish *Daily Independent*, a paper which has peculiar opportunities of knowing the intentions of the Government, announces that, as might have been expected, there is not the smallest intention of covering the hiatus between what the Conference report proposed the landlords should receive and the tenants should give, by a grant from the Imperial Exchequer. The Government are pledged to bring in a sweeping Land Purchase Bill; but if they offer a bonus to landlords as an inducement to sell, it will be a small one, and provided out of economies in Irish administration. Beyond the fact that William O'Brien and Lord Dunraven conferred in friendly council and agreed that the Irish land question might be settled by a grant of from fifty to one hundred millions sterling from the British Treasury, it is to be hoped that the doings of the Conference may be forgotten. O'Brien's hysterical pity for the landlords, "deprived of the incomes they are justly entitled to, suffering heavily by the operations of the Land Acts, ready for the public good to accept compensation for the sacrifice of sentiment involved in parting with their estates," for prices as far beyond the landlords' wildest hopes as beyond the market value of what they have to sell, will, so far as remembered, place him outside the ranks of consistent, practical, and trustworthy politicians.

AN IRISHMAN.

THE NEW OIL COLORS.

LONDON, February, 1903.

I do not know if the interest in M. Raffaëlli's Solid Oil Colors has been as great and as general in New York as in London, but here few matters of such purely technical importance have been as much talked about. The new colors were announced months ago. Reports of what had been done with them in Paris were spread. Certain English dealers advertised that they held the monopoly for England; but when artists flocked to buy, there were still no colors to sell, and expectation grew all the keener. A show of work to prove their practical worth was promised for the beginning of January; it was postponed until the end of the month. Altogether, the patent-pill man or soap manufacturer might envy M. Raffaëlli the advertisement he has enjoyed, partly by chance, partly owing to the eagerness of artists to put his invention to the test. However, his exhibition has at last opened in one of the smaller London galleries—the Holland, in Grafton Street—and there is an opportunity to judge from the most eloquent sort of evidence just what can be done with his colors.

By this time, I fancy, every one concerned knows that what M. Raffaëlli has invented is a preparation of oil colors in solid form, like pastels. He has taken some two hundred pure or mixed tints, and compressed them with a waxy medium into sticks. These are soft internally, but, applied to canvas, paper, or any other surface, they dry like ordinary oil colors in about the same time. The skin that forms over them, a protection really, can be rubbed off in the working, and without trouble even, it is asserted, if the colors have been laid aside for some time. These sticks can be used like colored chalks or like pastels; and they can be put on the canvas more or less solidly, worked over and into each other with a brush by means of any of the usual mediums, and, when dry, gone over again with the point of the brush. In fact, almost anything can be done with them. M. Raffaëlli's theory is that the accepted method of painting in oils with a brush is a barbarism; between the artist and the expression of his ideas, or rather of the beauty which he sees and wishes to express, there is ever a difficult technical process, sometimes so all-engrossing as to demand his entire attention. And then there is the palette to be prepared, and, afterwards, brushes to be cleaned, and work is involved with useless mechanical details, tedious and distracting. The less that comes between the artist and his picture, the more rapidly and directly he can say what he has to say, the greater freshness and spontaneity will he retain in the record of his impressions.

M. Raffaëlli's theory has been absurdly misinterpreted in London already. As every one knows, he has a tendency himself to use the brush charged with color as if it were pastel. Therefore, it has been objected that while his invention is, of course, eminently adapted to his own need, all it will do for other painters is to force them to borrow his technical mannerisms, and, by increasing their facility of production, help them to turn out twice as much work as they do now—an evil greatly to be deplored. The example of the conscientious man who gives years to perfecting one little picture is held up as a warning and a moral. The overproduction of rubbish, it is true, has grown to be a serious enough evil without the assistance of M. Raffaëlli. But the power to work rapidly and to accomplish a great deal has never yet been held a crime when there was question of the masters, or else Dürer, Rembrandt, Titian, Tintoretto, and how

many others must long since have been proved guilty and condemned. This objection can be dismissed without further thought. Besides, to do M. Raffaëlli justice, all he has argued in favor of his colors is that the increased facility they bring means increased freedom in the artist's powers of expression, and it is towards this freedom that the development of art has ever tended. He seems to think he has but accomplished that which was dimly foreseen in Leonardo's question, "Why should we not paint with colors held in our fingers?" As to the other point, the effect the substitution of a stick of color for a brush charged with color will have in modifying or changing the style of the artist, it is settled very conclusively by the show just opened.

M. Raffaëlli has succeeded in obtaining pictures painted in his colors from many artists of many nationalities. From France came Besnard, Carrier-Belleuse, Steinlen, and himself; from Holland, Mesdag and Cassiers; from Scandinavia, Fritz Thaulow. The English artists are more numerous, though hardly as distinguished. The Academy is represented by Herkomer and Alfred East, and, of the men outside the Academy, Grosvenor Thomas is much the most accomplished. Several contributors, it must be admitted, have not gone to great pains to produce masterpieces. Of the greater number, that is—were the quality of the work alone considered—far better examples have been seen in other exhibitions. But there is hardly one who does not, in his own way, help to prove the wide range of the new medium; and this, after all, for the moment, is the great thing. It is only natural that M. Raffaëlli should have taken more trouble than the others to make a good showing. There are landscapes by him, characteristic streets, flowers—in fact, only his portraits are missing. And it is as natural that in these pictures he should have aimed at demonstrating all the possibilities of his colors. In one or two landscapes he has used them just as if they were pastels, and drawn with the point on paper, getting all the delightful qualities of pastel without the drawbacks of that fragile, friable medium. In other pictures he has worked with them as with a brush on canvas—it may be some final touches were put on with a brush—and the result is precisely that of an oil painting done in the ordinary way. Surface and texture are the same, nor does his color lose any of its delicacy in the gray harmonies he loves, nor any of its richness in the stronger effects he sometimes seeks, as in his flowers. If one did not know that there was a special reason for the exhibition, nothing in his work would suggest it. Nor would anything in the contributions of M. Besnard, who, however, seems to have gone out of his way to exhaust all the resources of the new colors within the limits of one small frame. He has a little nude against thick foliage, in which the figure looks as if it were washed in with water-color, while the trees, one would say, were pastel on a groundwork of oils. It is an admirable piece of work for M. Raffaëlli's purpose, but one wonders what the Morellian of the future will make of it, arguing that, because such a chaotic technique is not characteristic of Besnard at any period, therefore the painting cannot be his! No one else has been quite as adventurous. But the pictures that make up the rest of the collection, among them, provide as much variety as even M. Raffaëlli could wish in proof of the value of his invention. M. Carrier-Belleuse sends a drawing of a ballet girl that would not be refused a place with the pastels at the Salon, and M. Thaulow pictures that would surely hang with the paintings. One man gets his effect with line, another with juxtaposed dots of colors in the manner of the Pointillists.

To sum up, each artist here exhibiting does just what he wants with the solid colors, using them in the fashion that suits him best, and he loses nothing of his individuality in the process. M. Raffaëlli, indeed, contends that, on the contrary, the artist, working with the new colors, "improves on himself and in his own peculiar vein." But allowance must be made for the enthusiasm of the inventor. A painter's individuality expresses itself despite his medium, not because of it. Improvement in technical processes never yet created the genius, however much it may have lightened his labors. But, anyway, the advantages of the solid colors are many enough, even if one does not go quite to the same lengths in their praise as M. Raffaëlli. Their great merit is, that they make for simplicity. Whether artists adopt them or not will be, I think, wholly a matter of personal liking—a question of preferring a stick to a brush; but those who do will find them of immense convenience, for they simplify all the mechanical part of painting. For sketching out of doors especially will the difference be felt when a piece of paper and a selection of the little sticks take the place of the old elaborate paraphernalia. The question still to be settled is whether the colors are permanent. There has not been time as yet to see. If they are, then I should say, and I know many painters agree with me, that M. Raffaëlli has contributed a genuine service to art and artists.

Correspondence.

WHITMAN AND OREGON.

To the Editor of The Nation:

Sir: Your correspondent in the *Nation* of February 5 deprecated the reprinting of Senate Document 37 as ill-advised. I do not know what influences have been brought to bear to secure its reprinting, but I am sure that no inconsiderable number of those who are not averse to being classed as the "friends of Whitman" here in Oregon can only regret that any one has thought that the reprinting of this document was called for.

Permit me to say, however, in this connection that some of us here in Oregon, not "descendants of the missionaries," are not quite ready to accept without qualification your correspondent's estimate of the "utter obliteration of the [Whitman] legend by Prof. E. G. Bourne." If this obliteration mean a denial to Whitman of a large influence contributing to a solution of the Oregon question favorably to the United States, an influence beginning with his first coming to Oregon in 1836 and culminating with his part in the events of 1843, then we may be permitted to hold that "utter obliteration" is quite too strong a term.

In particular, one important piece of testimony to Whitman's influence in this matter has been left unaffected by Professor Bourne's criticism, except so far as it has been really strengthened by his reference of it to its probable source. On page 21 of 'Essays in Historical Criticism,' Professor Bourne says:

"The only evidence that has been advanced to show that the 'saving of Oregon' was attributed to Marcus Whitman before Spalding published his articles, is an extract from a book by a French traveller, De Saint-Amant, published in 1854; and this evidence is secured by the use of deceptive phrases in translating the passage. This writer is said to have 'published to his countrymen that Whitman, the missionary, was largely instrumental in saving Oregon to the United States.'"

The words quoted are from a memorial address by the present writer, which was published in the Whitman College *Quarterly*, December, 1897, and which, so far as I am aware, was the first use made of the testimony of Saint-Amant in this controversy. As to the use of deceptive phrases charged by Professor Bourne, I may say that the words of the original French were in my mind at the time this sentence was written, and with the full understanding of them as given in Professor Bourne's translation, on page 106. I am quite willing to rest my justification of the use I have made of the original in a simple appeal to Professor Bourne's own translation.

As to the probable source of Saint-Amant's information, I agree in the main with Professor Bourne. Saint-Amant was in Walla Walla in October, 1851, less than four years after the Whitman massacre. While there, he doubtless saw and conversed with the Catholic missionaries of that region, as he did with the Catholic missionaries elsewhere in Oregon. There is no reasonable doubt that here was the main source of his information. But this, in my judgment, makes his testimony the more important, for it makes it practically the testimony of these missionaries, than whom there were at that time nowhere keener, closer, or better qualified observers of the influences that were determining the ultimate event in which they, in common with Whitman, were deeply interested.

A peculiar interest is given this testimony by a letter, now in the files of the Indian Bureau at Washington, written by Charles Serrugs to J. C. Spencer, Secretary of War, under date of Georgetown College, D. C., March 4, 1843, and enclosing a letter from the Rev. P. J. de Smet of Oregon, setting forth the "origin, progress, and prosperity of a settlement made among the Indian tribes in the Oregon Territory." This letter is important in this connection as showing that the Catholic authorities in Georgetown were in close communication with the Catholic missionaries in Oregon. The missionaries at Walla Walla were in a position, therefore, to know not only what was going on in their own neighborhood, but what was going on at Washington as well. Add to this, that in 1843 a body of Catholic missionaries from St. Louis travelled the route a little in advance of the immigration of that year, and that, on one occasion at least, Whitman carried back from these missionaries to the Oregon immigrants valuable information as to the route, and we get further insight into the opportunities these men had to observe the influences that were shaping events.

The important fact, then, still remains that the men who of all men on the field at the time were best qualified, by education and training, by interest in the event, and by their opportunities of observation, to weigh the forces of history, have left, through this publication of Saint-Amant's, this early testimony that "Whitman the missionary was largely instrumental in saving Oregon to the United States," or, if Professor Bourne's rhetorically stronger translation be preferred, "contributed in no small degree to promote annexation."

J. R. WILSON.

PORTLAND, OREGON, February 16, 1903.

CULTURE AND "COMMONNESS."

TO THE EDITOR OF THE NATION:

SIR: The interesting "Observations in a Big University," by your correspondent "Agatha," raise anew the question as to the compatibility of Culture with universal education. Matthew Arnold, in the preface to his essay on 'Culture and Anarchy,' quotes from Renan as follows:

"The countries which, like the United States, have created a considerable popular instruction without any serious higher instruction, will long have to expiate this fault by their intellectual mediocrity, their vulgarity of manners, their superficial spirit, their lack of general intelligence."

This extract is followed by Mr. Arnold's own acceptable definition of Culture as "the disinterested pursuit of perfection."

Now unless it is possible for us to contradict M. Renan by demonstrating that we have in this country a class of people engaged in the disinterested pursuit of perfection, and that this class is increasing in proportion to the increase of college graduates, then "Agatha's" observations on the hordes of imperfectly qualified students who are flocking to the prominent universities of the West and threatening, like the barbarians of old, to overrun the inner defences of enlightenment, would seem to sustain M. Renan's prognostication, and to justify her alarm lest Culture is not holding its own as against "Commonness," in this section of the country at least.

If there is a remedy for so lamentable a condition, it must be found either in the universities themselves, or in the students to whom they award degrees. But in the prominent universities of the West the standards of admission and the requirements for a degree are about identical with those of the prominent universities of other sections. Their professors are, as a rule, able men, thoroughly equipped, finely accomplished, often strikingly original, and devoted to the dissemination of knowledge. If, therefore, in any large Western university the dissemination of knowledge is not accompanied by the spread of Culture, this cannot be due to failure on the part of the university to maintain a standard equal to the best American standards, or to any failure on the part of the professors to fulfil their duties in an adequate way. Is it, then, the student body who are responsible for the triumph of "Commonness" over Culture?

It may be that, tried by the highest standards, the average student of the universities of the Far West is somewhat uncouth in manner, rather unenlightened, and sometimes mistaken as to his or her true vocation. But they are far from dull or negligent. They have set out to obtain an education—in true American fashion—regardless of obstacles, and their earnestness is often carried to the point of heroism. They are unflagging in attendance at lectures, anxiously attentive to their duties. Indeed, they frequently evince a nervous apprehension of "being flunked out of college," in striking contrast to the easy assurance of the Eastern undergraduate who pays a tuition fee.

Now if we cannot impugn the standards of the prominent universities of the Far West—and, as a matter of fact, their requirements for admission and for a degree are constantly increasing—nor the character of the teaching within them, and if of the student body we can say no worse than that "their reach exceeds their grasp," why is it that Culture—and even the outward and visible signs of Culture—are so little in evidence in a region where there is at least one college student or college graduate in almost every home? Can it be that M. Renan is right, and that our experiment in universal education is still in such a probationary stage that we are not yet in sight of the conditions where Culture shall neutralize "Commonness"?

Yours truly, FANNY PURDY PALMER.

PALO ALTO, CALIFORNIA, February 14, 1903.

INDEX MIRABILIS.

TO THE EDITOR OF THE NATION:

SIR: Having occasion to consult the index to Alderson's 'Andrew Carnegie' (Doubleday, Page & Co., 1902), I am surprised to find that it apparently bears no relation to the text of the book. In no case have I been able to find anything bearing on a subject on the page to which reference is made in the index, neither do I find index entries to correspond to prominent subjects in the text. For example, the index contains "Skibo Castle, 203-206, 208-209." These pages in the text are made up of quotations from Mr. Carnegie's writings, with no reference to the castle. An index entry is "Libraries, free, 85, 164, 175-178, 184," but there is nothing about libraries upon any of these pages, although I find much unindexed matter relating to libraries in other parts of the book. On page 156 I find the story of Col. Anderson's kindness in lending books to the boy Carnegie, but the index reference is to page 175, where there is no mention of the colonel. I am unable to find any clue to the principle upon which the index is made. The only suggestion that comes to me is that the references are to the pages of the typewritten "copy." The publisher's explanation would be of interest. At any rate, they owe their customers an apology for selling them a book with an index which is not an index.—Yours very truly,

GARDNER M. JONES.

SALEM, MASS., February 21, 1903.

Notes.

Our recent review of Fletcher's critical edition of Carlyle's 'French Revolution' was based upon the London issue of Methuen & Co., as duly acknowledged. We now receive the work in three handy volumes from Messrs. Putnam, who are its publishers for this country. They will likewise coöperate with Mr. Murray in the forthcoming 'Life and Times of Georg Joachim Goschen, Publisher and Printer of Leipzig,' by Viscount Goschen.

The author of 'Chimmie Fadden,' Edward W. Townsend, is to publish through Henry Holt & Co. 'A Summer in New York.'

'Stories of Old New Haven,' by Ernest H. Baldwin, lecturer in history at Yale University, will issue from the Abbey Press of this city.

Houghton, Mifflin & Co.'s spring announcements include 'Texas,' in the American Commonwealths Series, by Prof. George P. Garrison of the University of Texas; 'William Ellery Channing,' by the Rev. John W. Chadwick; 'Phillips Brooks,' by William Lawrence, Bishop of Massachusetts; 'A Young People's History of Holland,' by the Rev. W. E. Griffis; 'Aids to the Study of Dante,' edited by Charles A. Dinsmore; 'The Enjoyment of Art,' by Carleton Noyes; 'The Flower Beautiful,' by Clarence M. Weed; an anthology of 'The Poets of Transcendentalism,' by George Willis Cooke; 'True Bird Stories from My Note-Books,' by Olive Thorne Miller; the Complete Poems of Alexander Pope, in the Cambridge Series; and 'His Daughter First,' a story by Arthur Sherburne Hardy.

Harper & Bros. have in press 'The Emperor's Speeches,' translated from the German of Emperor William by Wolf von Schierbrand.

D. Appleton & Co. have nearly ready 'Horace Greeley,' by William A. Linn; 'Millionaire Households and their Domestic Economy, with Hints upon Fine Living,' by Miss Mary Elizabeth Carter; and 'Trust Finance,' by Dr. E. S. Meade, of the Wharton School of Finance.

'Trees, Vines and Shrubs of the Northeastern United States,' by H. E. Parkhurst, and 'The Story of Oratorio,' by Annie E. Patterson, are announced by Charles Scribner's Sons.

The second volume of Professor Wiener's 'Anthology of Russian Literature' is in the press of Messrs. Putnam, along with 'The Gates of Silence, and Interludes of Song,' by Robert Loveman. Their forthcoming "Little French Masterpieces Series," edited by Alexander Jessup, will lead off with specimens of fiction, translated by George Burnham Ives, in six volumes, beginning with Mérimée. Each author will have an introduction—as, Balzac from Brunetière. Soon to appear is 'Penal Servitude,' an account of the prison experiences of Lord William Nevill, who served a reduced term of four years for fraud.

'Women Authors of Our Day in their Homes,' by Francis T. Halsey, will be brought out in March by James Pott & Co.

Macmillan will shortly have ready 'First Lessons in United States History,' by Prof. Edward Channing of Harvard.

'The Child Housekeeper,' by Miss Elizabeth Colson and Anna G. Chittenden, is a novel product of "actual experience in teaching small girls to do intelligent work in their homes." It will bear A. S. Barnes & Co.'s imprint.

Frederick A. Stokes Co. announce 'The Fern Collector's Guide,' by Willard Nelson Clute, and 'The Book of Old China,' by Mrs. N. Hudson Moore.

Brentano's will publish in April an unabridged translation of Sénancour's 'Obermann.'

Joseph Elkinton, of Philadelphia Yearly

Meeting, will publish, through Ferris & Leach of that city, an illustrated book on 'The Doukhobors.'

The Rev. Dr. Mills, formerly of New York, who has entered upon his second quinquennium as professor of Zend (Avesta) Philology at Oxford, having been recently reappointed for five years, will soon be publishing the first issue of a treatise on the rest of the Yasna upon the same lines as those followed in the book on the Gâthas, that is, with the four texts, three of them translated, and with the variants of the Pahlavi. He is delaying his special dictionary, now half published, for a general one by another writer which is about to appear. His book on Zoroaster, Philo, and Israel is about half printed, and the first part will be published in a few months.

Fifteen years ago, if we can imagine history slightly anticipated *ad hoc*, Pierre Loti's 'The Last Days of Pekin' (Boston: Little, Brown & Co.) would have made a great hit. It is well translated by Myrta L. Jones, and illustrated from photographs and drawings by Jessie B. Jones. The author's account of China first appeared in letters written to the *Figaro*, at the time when he was serving in Chinese waters on one of the French warships. He saw China and Pekin in the hands of the Allies, he penetrated the arcana of the Forbidden City, and the sacred precincts which enshrine the remains of the present race of emperors. The book was worth writing and is worth reading, is full of the author, and hence "personal," and it relates to recent events of extraordinary and lasting interest. If it does not impress the reading public as some of its predecessors did, this must be partly because fashion in books changes nowadays so fast. An author's popularity is now said to have a "life" of only ten years, and Loti must, with others, submit to the common fate.

In the new (third) volume of the 'Jewish Encyclopædia' — Bencemero - Chazanuth— (Funk & Wagnalls) the different articles under Bible—canon, editions, exegesis, translations, etc.—extending in all to fifty pages, are undoubtedly the most important single element. They are generally very well done, much better, part by part, than the corresponding sections in the 'New International Encyclopædia'; the facsimiles especially are excellent. More novel is an elaborate article on cantillation, where the differing musical values of the "accents" are carefully worked out. This article has real significance, and supplements even Wickes's treatise on the accents. Those on blood-accusation and on the effects of the Black Death in causing persecutions of the Jews stand out equally with a melancholy and still modern value. Of mingled tears and laughter is a ten-page article on censorship. The history of this mournful absurdity is minutely traced, and specimens of expurgated pages are given, with, finally, a page from this very encyclopædia, as censored in Russia. This whole article, it is probable, will be able to enter that country only by letter post. Of pure, if unintended, humor is the attention paid to various Jewish pugilists. Apparently the editors are at pains to prove that Jewish strenuousness has not been spiritual only. Equally light in parts is a most serious article on blasphemy. In it one authority is driven to the decision, "He who hears blasphemy nowadays is not obliged to rend his garments, because otherwise his garments would be nothing but tatters." Worthy of mention as a thorough, if somewhat heavy, monograph is the twenty-three-page article on Cabala. It is highly condensed, and has a bibliography of nearly a column. Noteworthy, too, are the articles on Calendar and Charities, and an admirably reproduced Catalan "portulano" of 1375 by Cresquez the Jew. Such facsimiles are evidently to be an outstanding feature of the work, and they go far to heighten its mediæval flavor. But its main stock and substance, apart from sentiment or picturesqueness, remains in the biographies.

'Erromanga,' by the Rev. H. A. Robertson (A. C. Armstrong & Son), is a simple but touching account of thirty years' mission work on one of the New Hebrides group in the Southern Pacific. Here John Williams, the "apostle of Polynesia," was murdered some sixty years ago, and several of his successors, so that it is now known as the "martyr isle." The author, before describing his own experiences, gives a sketch of these men and what they accomplished. He has other chapters upon the habits, industries, and distinguishing characteristics of the islanders; and in the story of his daily life and experiences among them are graphic and attractive pictures of individual natives. An occasional dash of humor lightens up the narrative, which has many pathetic episodes. A great hindrance to the prosperity of the island and the development of its rich natural resources is the Australian labor traffic, which takes away large numbers of its best men, many of whom never return. One of the difficulties encountered in teaching the islanders is indicated in an appendix containing the Lord's Prayer in eighteen different languages spoken by the people of the group. The work is edited by John Fraser, and has maps and illustrations.

The little book entitled 'Faith Built on Reason: A Survey of Free and Universal Religion in the Form of Question and Answer,' by Miss F. L. Abbot of Cambridge (Boston: J. H. West), is rendered most interesting and of really remarkable character by the absolute clearness and simplicity with which the daughter of a highly cultivated man reproduces her father's work, and translates it with unvarying fidelity into the common tongue. Dr. Francis Ellingwood Abbot's thought is here followed out to the last degree, and made intelligible in its foundations, which end in natural religion, based, as its author claims, on absolutely plain and coherent grounds. When the author comes to what many, even among radicals, would consider the weak point, namely, the complete exclusion of what is commonly called the intuitional method, its question is faced in the same perfectly simple and unflinching way which marks all the rest. "Intuition," the author says, "is a purely personal experience and is capable of no universal proof. One man's intuition has no decisive value for another man who does not have the same intuition. Only those answers to these questions will have any universal value which are based on something greater than individual experience and are demonstrable to the whole human race. Such answers can be given by science alone." This is absolutely frank and honest, but to poetic idealists and those who hold consistently to the Inward Light, it would, of course, be wholly inadequate. Whittier could no more accept it than could John Calvin. Yet so few statements on any opinion are made in a perfectly logical spirit and are thus altogether consistent, that it is pleasant to see any such successful effort made, and especially when it comes from the feminine side of the house.

Mr. Andrew J. George's 'Select Poems of Samuel Taylor Coleridge' (Boston: D. C. Heath & Co.) is a thoroughgoing performance, well adapted for private or school use. The poems are arranged chronologically, dated, and accompanied in a separate section by the poet's biography for the period, with such light as can be thrown upon the circumstances of their production. The notes are mainly historical, and there is more borrowed than original criticism, in which the editor hardly shines. His introduction, too, is an essay beyond his grasp. He has, however, given the best of Coleridge and examples of every vein, but the humorous should have been reinforced by the autobiographical "A Character," which is indeed referred to and explained in the notes (p. 396). The poet's text is remarkably free from error. We have noticed only two: on page 262, line 15, "this" is a corruption for "an," and "a" is omitted before "sick" in line 15 of page 42. On the other hand, the editorial matter is greatly disfigured by carelessness in quotations: witness those from Burns and Cowper on pages xxxviii., xxxix., xli., and the last line but one of the Coleridge variorum on page 304. The Greek of page 342 and the German of pages 355, 370 have suffered a sea change. And, on page 385, is there any authority for this lection in Wordsworth's Clarkson sonnet—

"The blood-stained *enemy* is forever torn"?

"Bloody writing" is an accepted lection. With these reserves, Dr. George is to be commended for redirecting students to an author of whom Swinburne has said, with his customary extravagance, but with much truth, "Of Coleridge's best verses I venture to affirm that the world has nothing like them, and can never have; that they are of the highest type, and their own."

'Sally Wister's Journal' (Philadelphia: Ferris & Leach) is a short and sprightly record of the experiences of a Quaker girl of sixteen, who, with her family, took refuge in a farmhouse on the Wissahickon during the brief occupation of Philadelphia by the English in 1777-8. The farmhouse, which still stands, became the headquarters of General Smallwood, and there was a constant going and coming of officers and men, with demure passages between the writer of the journal and certain youthful Virginian captains and majors. The editor, Mr. Albert Cook Myers, has dignified a slight school-girl diary into an historical document, with copious biographical notes and numerous illustrations. The glimpse of Sally Wister herself, with her quotations from Pope, and her most un-Quakerish interest in pretty clothes, is entertaining enough. Quaker maidens, in those days, read Fielding's 'Joseph Andrews' and Pope's 'Iliad' with uncritical enjoyment. Sally Wister's apparent laxity in the choice of fiction was atoned for by a habit of rising at four in order to spend the morning in ironing, and by an extraordinary devotion to knitting. No pains have been

spared to make the book attractive, though the journal itself can hardly possess an intrinsic interest except for members of the Wister family.

Another book on astronomy by Prof. Simon Newcomb—'Astronomy for Everybody' (McClure, Phillips & Co.)—attests the good appetite of the public as well as the productivity of a distinguished scientist. The book is written in a simple style, without technical or mathematical language, and therefore treats hardly more than the outlines of its subject, yet the outlines include a sketch of the four methods of measuring the sun's distance, and something about the repulsion of comets' tails by the pressure exerted by sunlight. Modern methods are illustrated in the application of photography to the search for asteroids, and modern results in the account of Eros, the most curious of all the minor planets. Spectroscopic observations by Belopolsky are accepted as proving a rapid rotation for Venus, in contradiction to the results gained by Schiaparelli and Lowell. The moon is credited with a total lack of atmosphere. The explanation of its action in causing tides on the earth may leave the reader less satisfied than he is likely to be with the other pages of this concise book.

We should have completed our notice, a fortnight ago, of the complete and abridged Muret-Sanders German-English Dictionaries by mention of the still further condensed Pocket Dictionary in the Langenscheidt series—a new edition (New York: Lemcke & Buechner). This does not belie its name, as to compactness and convenient form, and it has had the advantage not only of the greater work, but of the Oxford Dictionary in its present stage. This, say the publishers, has enabled the compiler to discard all the deadwood (*den ganzen Ballast*) of antiquated expressions, always the stumbling-block in bilingual dictionaries. So far does Dr. Murray's candle throw its salutary beams. In this little companion of the tourist or the reader, the familiar signs of the Muret-Sanders scheme pleasantly dot the pages (as, a locomotive for the class "transportation," a comet to denote "rare," etc.). Pronunciation is indicated in the English portion; and it is noticeable that Shakespeare, Lincoln, and Washington are admitted to the general vocabulary, along with Mabel, Madge, Dorothy, etc., and a select group of geographical names, for all which separate lists are commonly provided in dictionaries.

Parts 5 and 6 of the 'Catalogo Generale della Libreria Italiana, 1847-1899' (Milan; New York: Lemcke & Buechner), stride from Grimaldi to Levinstein, thanks to two letters, H and K, which perforce include only foreign authors. Guides, Instructions, Laws, and Letters are noticeably full rubrics of from four to seven pages. Among classic Italian writers, Guicciardini shows a reprint of his History of Italy as late as 1876. Leopardi continues much in vogue. In the foreign list, Guizot has been practically relegated to the reference shelves since the forties; Victor Hugo's revivals seem mainly confined to his 'Notre Dame de Paris,' 'Les Misérables,' 'Dernier Jour d'un Condamné,' and 'L'Homme qui rit'; Paul de Kock is uninterruptedly reproduced, while Lamartine barely gives signs of vitality. Heine survives bravely. Humboldt has had no edition since 1865, and is about in the case of Hippocrates. Paul Heyse and Ibsen are in active request. Landor's Italian sojourn did not prompt a single translation from his writings. Washington Irving was thus honored as late as 1893. Richard Hildreth's 'Archy Moore (The White Slave),' profiting by the furore excited by 'Uncle Tom's Cabin,' in 1853 went into one French and at least two Italian versions (four imprints). Judge O. W. Holmes's 'The Common Law' was translated in 1888-9, while his father never gained a footing on the peninsula in its vernacular. Mrs. Mary Catherwood is entered here under her maiden name of Hartwell, as Liszt's pious correspondent, the Countess Sayn Wittgenstein, is entered under Ivanoska.

The fifth volume of the Quarterly of the Texas State Historical Association, just come to hand, is composed of articles strictly confined to the State and its eminent citizens, with a range from "The Connection of Peñalosa with the La Salle Expedition" to a "Genealogical and Historical Register of the First General Officers of the Daughters of the Republic of Texas Elected in 1891." While the editors properly disclaim responsibility for the views advanced by the authors of the several papers, they might hold these to some accountability in respect of the historic temper, the absence of which is too conspicuous in the paper on "The Annexation of Texas and the Mexican War."

The fifth volume of the now classically housed Buffalo Historical Society is a substantial one of some 500 pages, containing much valuable original matter pertaining to the war of 1812, which is to Buffalo what the war with Mexico is, for perennial interest, to Texas; much other, from the pen of Judge Samuel Wilkeson, regarding Buffalo's beginnings as a port and as an international thoroughfare; and a history of the Buffalo Free Library movement. La Salle has a place here, too, for the Society erected last May a boulder monument to the explorer, with a tablet showing that "hereabout, in May, 1679," he built his *Griffon*, the first vessel to sail the upper lakes. The Secretary, Mr. F. H. Severance, contributes a very valuable Bibliography of the Upper Canada Rebellion of 1837-8, with sundry facsimile title-pages.

A most interesting account of the battle of Sackett's Harbor is printed among the Historical Manuscripts in the February Bulletin of the Boston Public Library, in a letter from Gen. Jacob Brown, commanding the American forces, to Gov. Tompkins of New York, written the second day after the battle. When the British made their attack he was with the militia, and, "as I was attentively watching thier movements & the happy effects of our fire to my utter astonishment my men rose from thier cover, broke & before I could realize the disgracefull scene there was scarcely a man within several Rods of where I stood." He exonerates Lieut. Chancey from all blame for burning the storehouses on the supposition that the day was lost. "He was decieved by the materials on whom he relied & nothing short of Divinity can guard against such occurrences." Brown assures the Governor that he does not "bear hard upon the militia. I do them justice Sir. . . . The noble men both officers & Soldiers of the Regular Army & some few, precious few Citizen Soldiers who nobly resisted the Shock of the Foe men the Foe of Basswood Cantonment are the men who merrit the honor of this Victory & Sir they must have it." Senator S. R. Bradley of Vermont, in a letter dated January 27, 1810, to Judge Royall Tyler, says that he is tired of his seat in the Senate, and makes this suggestion, "that I shall take Govr G.'s place—that you shall take the place I now hold—that Judge Robinson shall take the place you hold, and that D. Chase shall be placed on the Supreme Court *vice* Judge H. who may probably wish to retire to preach the gospel to the Baptists." The plan miscarried, as Gov. Galusha remained in office till 1813, at which time Bradley also retired, to be succeeded by Chase.

The first of the "Reports of the Princeton University Expeditions to Patagonia, 1896-1899," issued by the J. Pierpont Morgan publication fund, gives a narrative of the expeditions and a general sketch of the geography of Southern Patagonia (Princeton). The narrative contains much material of interest to the general naturalist: the habits of the condor, the great tides of the eastern coast, the extraordinary fossils collected from the bluffs along the shore as well as far inland, the natives of the interior, the glaciers of the Andes. So little is known of much of the region, and it appears to be so rich in specimens of many kinds, that many explorers should be attracted to it. The geographical chapters treat of the plains, with special accounts of the great shingle formation and of the valleys that it cloaks, the mountains and their longitudinal valleys, the rivers, the lakes, and the coast. The Tehuelche tribes are described with some detail, and, here as elsewhere, heliotypes from photographs make excellent illustrations. The reader must certainly hope that the enthusiastic explorer may be spared the pain of being "forced to abandon all hope of ever again visiting" the plains of Patagonia.

From the office of the weekly journal *South Africa*, published at No. 39 Old Broad Street, London, E. C., we receive a timely folding map of South Africa, mounted on cloth and sold for two and a half shillings. It is primarily a railway map, extending from Cape Agulhas to the southern extremity of Lake Tanganyika, embracing the whole of Lake Nyassa and its outlet the Shire, with the coast line from the mouth of Orange River to the Zambesi delta. A small map exhibits the whole of Africa and the Cape-to-Cairo route; the Natal railway system is shown on a larger scale, as are also Cape Town's suburban lines; and there are plans of eight seaports. For every line there is a table of stations, distances, and gradients.

—No one who followed the literary career of John Fiske will be surprised to see that his works fill twenty-four volumes in the edition which has just been issued by Houghton, Mifflin & Co. His subjects were not only numerous, but of the widest scope—history, science, religion and philosophy; and his love of writing was equal to the breadth of his information. Indeed, it may be surmised that twenty-four volumes fail to contain the full product of his maturity, though they doubtless contain his more permanent credentials to

fame. Reckoned by bulk alone, the historical works are equal to the miscellaneous writings combined, and this fact will account for an arrangement of contents whereby they occupy the first twelve volumes of the set. Regarding the miscellaneous writings, we shall at present say nothing, and we also feel that we need say little regarding the histories. Were we seeking an excuse to criticise Mr. Fiske as an historian, the occasion now offered would be most welcome, but since this is not the case, we shall be content to describe the edition before us in a brief bibliographical note. As every one knows, Mr. Fiske's series of books on American history begins with 'The Discovery of America' and closes with 'The Critical Period of American History.' At the time of the author's death in June, 1901, there was a conspicuous break in the sequence of volumes; but the lacuna has been partly filled by the posthumous publication of 'New France and New England.' Thus the set reviews the main aspects of American progress from the period of discovery to the date of Washington's first inauguration. Had Mr. Fiske lived a little longer, he certainly would not have issued 'New France and New England' in its present form; but on the whole its publication as part of a series cannot be condemned, though the unwary reader must be cautioned against judging the author by it alone.

—The mechanical features of this edition are good; paper and type deserving special praise. The photogravures are hardly of the first quality, but cannot be called inferior. If the tone is sometimes too dark, it must be remembered that the volumes are issued at a moderate cost. We should add that the maps and plans, of which there are many, offer slight ground for adverse remark. The portrait of Père Marquette, however, should not have been included without the warning which is conveyed by "reputed" or "alleged." Our own verdict against its authenticity has already been expressed in another connection. Comment upon a set of twelve volumes must take the form either of a short note or a long article. While we refrain of set purpose from embarking upon a criticism of Mr. Fiske's qualities as an historian, we must at least refer to one fact which is emphasized by the sight of his collected works. He was a popular writer, not merely because he possessed a clear and agreeable style, but because he had a faculty for selecting subjects of the broadest interest; and this faculty in its turn must be associated not with a clever eclecticism, but with an unusual strength of intellectual and social sympathies.

—'Germany's Claims upon German-Americans in Germany,' by Edward W. S. Tingle (Philadelphia: T. and J. W. Johnson & Co.), is the title of a valuable little handbook containing a discussion of "German military and other laws which may affect German-Americans temporarily in Germany, together with some comment upon existing treaties." Mr. Tingle was formerly United States Consul at Brunswick. It is stated in the introduction that the volume was offered by the author to the State Department for publication by it, for the use of the consular service, and was formally accepted by Secretary Sherman for that purpose. "Though in use in the Department in manuscript, its publication was delayed for various reasons, and the writer given the option of offering it to a publishing house." The text has been revised and brought up to date. The author's work has also, it seems, received the approval (the importance of which can hardly be overestimated) of Prof. von Bar, professor of international law at Göttingen, Herr Justizrath Ritter of the legal department of the German army, and Consul-General Mason at Berlin. Besides a discussion of the legal status of the German-American in Germany, the book contains many practical hints as to his behavior on his return to his native from his adopted country. Not only must he remember that, if he has run away to escape military service, he had better not return to Germany at all; but while in Germany he must suppress for the time the habits of free criticism of public officials so soon learned in this country, and remember that he is a German subject for the time being, though still an American citizen. For instance, he may subject himself to punishment for lese-majesty if he speaks disrespectfully of the Emperor, and for insult to the Government (*Beleidigung der Regierung*) if he is too free about the courts, the army, the navy, or any other department of the Government. Still further, if he is involved in a discussion with a railroad, a post-office, or a police official, he must be careful not to treat him contumeliously. Of course, most, if not all, of this applies not merely to German-Americans, but to all foreigners temporarily in Germany. They must be respectful to superiors. This is one of the most galling things in the world, but has to be borne in mind. There is on record the case of an American who, to his own utter amazement, got into serious trouble because a Prussian official resented being told that the traveller "would give him hell" if he did not look out.

—A 'Manual of French Law and Commercial Information,' by H. Cleveland Cox (New York: Brentano's), while, according to the preface, "principally for laymen," "may be of some interest and utility to the profession." It is a compendium of the "salient points" in the law of France, together with "special articles by experts." A number of forms are added, and the whole is alphabetically arranged—in other words, it is a handbook arranged in the form of a dictionary. A few of the catch-titles, taken at random, give an idea of the scope of this book. Under "Accaparement" we are referred to "Corners," and under the latter head we find some information about the legal penalties attached to the offence of buying up supplies of food, etc., with the object of fixing an artificial price. Under "Accidents to Workingmen" half a page is given to an account of the provisions for the indemnification of workmen by their employers under the law of 1898. Under "Address (change of)" some very practical advice is offered to travellers. Of "Aliéné" we are told that the word must not be confounded with "aliénation," as, in law, *aliéné* has only one signification, viz., lunatic, while the abstract term means primarily "transfer," "and in addition to that it means 'madness.'" Under "Animals (cruelty to)" some information is given as to the Loi Grammont. "Bankruptcy" is dealt with in nine pages, "Bicycles" in one, "Bills of Exchange" in nine, six pages are devoted to "Chamber of Commerce (American)" and "Chamber of Commerce (British)," but only twelve lines to "Charitable Bequests." Mr. Kasson's unratified Franco-American commercial treaty is printed in full (five pages). On the whole, while the book contains a good deal of useful and sometimes entertaining information, it is half manual and half hodge-podge.

—If a college series of Latin classics is to exist at all, it must, of course, have its Odes and Epodes of Horace, regardless of the number and excellence of editions already in the field. With Smith, Shorey, and Bennett to choose from, not to go further back, no teacher can feel at a loss for a workable class-room Horace; and yet the latest claimant, that of Prof. Clifford H. Moore, in the Morris and Morgan series (American Book Co.), is likely to meet with a very cordial reception. It has not the wealth of illustrative quotations from other poets that forms the chief distinction of Professor Shorey's edition, though the Greeks whom Horace followed, and the later Latin poets who learned, or tried to learn, from him are drawn upon not infrequently. The introduction and commentary show in general a fine appreciation of the poet and his work; but there is an occasional flaw, as when Horace is censured for lack of tact, in the fine ode to the ship which was to bear Virgil to Greece (i. 3), in reverting to "the old philosophical and theological notions of the sinfulness of human enterprise, without observing how out of place such ideas were here, when Virgil was just about to show such enterprise by undertaking this voyage." Professor Moore has done no brilliant experimenting with the text, nor marred his work by constant endeavor to set aside generally accepted interpretations. One notes an occasional oversight, as when a general assertion is made concerning a group of five examples (p. 30), to only two of which it will strictly apply. The introductions to the individual poems are especially full and helpful. Is it not about time that American editors of Greek and Latin texts should drop the stereotyped disclaimer of having consulted any American edition? If any of these editions are worth consulting, they should be consulted; if not, it is hardly necessary that the fact should be so frequently advertised in new members of the class. We have a good supply of school editions; when will some American scholar give us a Horace for the classically educated gentleman's drawing-room table, nicely illustrated, briefly annotated, fitly printed and bound, and with no trace either of the grind of the class-room or the pedantry of the philologist?

—Miss Agnes Grace Weld's 'Glimpses of Tennyson and of Some of his Relations and Friends' (Scribners) adds little to our previous knowledge of Tennyson, and confirms the impression that the margin of personal interest extending beyond that coextensive with the poet was extremely narrow: the poet was to a remarkable degree exhaustive of the man. The writer is a daughter of Anne Sellwood, the second of those Sellwood sisters two of whom married the brothers Alfred and Charles Turner Tennyson. Some

pride of relationship mingles with her reverence for the poet, and her book is motived as much by her desire to celebrate her nearness to Tennyson and his regard for her as by admiration of his genius and his qualities. Her manner of writing is effusive, and the excess of words tends to make the more valuable details seem even less significant than they actually are. Where a little light is expected on the difficulties attending Tennyson's courtship of Emily Sellwood, there is not a spark. There are pleasant glimpses of Charles Tennyson ("Charles Turner"), the pleasantest his objection to a curate's exorcism of flowers before using them for church decoration. The curate knew his 'Directorium Anglicanum,' but the rector insisted that if the flowers had spirits in them, they must be angels, and not devils. Miss Weld, herself, is wise in all things ecclesiastical, and would fain have us believe that Lord Tennyson was quite correct in his notions of Anglican belief and ritual, the "real presence" in the eucharist with the rest. At this point we get a different impression from that heretofore received, and are obliged to suspect the bias of Miss Weld's own devout Anglicanism. The "Talks with Tennyson" are singularly "barren of new pride." The account of his Isle of Wight friends is much better, especially the part relating to Mrs. Cameron, of amateur photographic fame. The trying of her skill seems to have worked Tennyson's patience hard, but the climax of his misery was when she brought a carriage-load of portraits for his autograph.

LANG'S HISTORY OF SCOTLAND.

A History of Scotland from the Roman Occupation. By Andrew Lang. In three volumes. London: Blackwoods; New York: Dodd, Mead & Co. 1902. Vol. II.

Mr. Andrew Lang has many qualifications for writing a great history of Scotland, and no European country more needs to have her history adequately written. He has a patriotic interest in the subject. He has a vast mass of miscellaneous knowledge, archæological and literary, bearing on the subject. He is a practised as well as a naturally acute critic. He is the master of a lively and vigorous style. And he has—no one who reads this volume can for a moment doubt it—the most conscientious and unwearied industry in examining both the original sources and the writings of his predecessors. Accordingly, we come with high expectations as well as with keen curiosity to this second volume of his history, covering a period for which the materials are far more abundant than they were for the days of the first four or five of the Stuart kings, and a period which presents problems of unsurpassed interest and difficulty.

In many respects these expectations are not disappointed. Mr. Lang investigates the problems with minute and scrupulous care. He scrutinizes all the data. He shows great ingenuity in constructing solutions. He gives us the impression of having exhausted all the available materials; and whether or not we agree with his conclusions, he inspires our confidence, for we feel that the materials have been honestly placed at our disposal. In discussing questions which have been for centuries the subject of heated controversy, he does his best to be impartial. As between the two chief contending parties, the Protestants and the Roman Catholics, the enemies and the supporters of Queen Mary, he succeeds pretty well, and succeeds by the natural course of condemning the violence and perfidy of both parties alike. But where he has to deal with individuals, he sometimes declines from the attitude of calm detachment which befits a writer reviewing these remote times. Towards John Knox in particular he shows a kind of spite rather below the dignity of history. Any one who treats of the Scottish Reformation is doubtless entitled to have a bad opinion of Knox, to expose his inconsistencies, or his suppressions, or his ferocities. There is in Knox's career something for his friends to regret, abundance for his enemies to descant upon. But it is scarcely worthy of Mr. Lang to keep up a running fire of sneers against Knox and others like him. It jars upon one's sense of literary taste to have this sort of thing repeated page after page and chapter after chapter. We do not need to be incessantly reminded that the Scottish Reformers, and indeed all the Reformers, refused to extend to others the toleration they claimed for themselves, and insisted in the same breath that it was a sin to resist the civil magistrate if he was a godly Presbyterian, and a duty to resist him if he was a Popish idolater, because in the one case he was following, in the other case transgressing, the law of God set forth in Scripture; and they were the judges of what Scripture meant. Nowadays every schoolboy, as Macaulay used to say, knows these things; and one may add every schoolboy knows that it was hardly possible that these things should be otherwise. Few indeed were the gentle or prescient souls who could rise to a point of view which our indifference, more perhaps than our charity, makes easy to people living in the twentieth century. Mr. Lang sometimes writes not like an historian addressing a vast body of readers prepared to listen with respect to him, but rather like a man who puts down for his own pleasure his own reflections, usually the expressions of his own disgust, as he follows the recorded deeds and words of the actors in the drama he is observing. He interjects his repartees, he tries to corner and make game of his antagonist, who is most often the triumphant Reformer, till we grow weary of the too obvious sarcasms upon "the godly." Too often the facts make sarcasm superfluous.

Admiring the versatile literary gifts which Mr. Lang has shown for many years past, we must also own to some little disappointment with the character of the narrative in this volume, considered as a piece of literature. He does not seem to make the most of the wealth and quality of the material which the career of Queen Mary sets before him. In that career, which has employed almost as many poets as controversialists, there are six specially dramatic incidents: the murder of David Riccio, the murder of Darnley, the surrender of Carberry Hill, the escape from Lochleven Castle, the battle of Langside, the death-scene in the hall of Fotheringay Castle. No one appreciates the scenic quality of these incidents more than Mr. Lang does; yet he has not used them, as he fairly might have done, to relieve the tedious and revolting tale of incessant intrigues, intricate negotiations, and miserable civil wars that scarce ever come to a pitched battle. So, too, he forgets, or declines to enliven his pages by, such minor bits of picturesqueness as the story of Bothwell's escape in the harbor of Lerwick from the pursuit of Kirkaldy of Grange. He seems to have become so much interested in the process of unravelling the frightful tangle of falsehoods and contradictions which the authorities present to us, as to have rather overlooked the need for making the narrative as interesting to his readers as it can be made, and for presenting not only the minor details, but the broader aspects of events.

As Mr. Lang writes quite as much for the expert student as for readers in general, he certainly deserves the amplest acknowledgment of what he has done for the expert. He has taken the utmost pains to get at the truth, gives us copious references, states his conclusions with conciseness and lucidity. Like every other competent and conscientious man who has worked over the same ground as Mr. J. A. Froude, he finds that writer hopelessly careless and inaccurate, and sometimes so inexcusably careless that one is tempted to apply a harsher name to his divergences from truth. He gives some striking instances of Froude's perversions of the very accounts cited. Unlike Froude, Mr. Lang is not able to find a single hero among the crowd of personages he has to deal with. Of Queen Mary he would like to say the best that could be said. But he feels, as all candid minds must feel, that the only possible best that can be said is not defence, but palliation. Everything was against the unhappy girl, and, with all her offences, she was true to her religion, she never lost either courage or a sense of her own dignity. Elizabeth, equally unscrupulous, excites a far stronger feeling of repulsion. False and shifty as Mary of Scotland was, she was not more shifty and false than most of those among whom her wretched lot was cast. for many of whom far less excuse could be given. Seldom in any country did any class show viler features than the Scottish nobility of Mary's day. Treachery, rapacity, cruelty, hypocrisy meet us at every turn; there is hardly one of the prominent figures, from the Regent Murray downwards, whose career can be contemplated without disgust. When one gets down to the smaller gentry, there is, if not more of the softer virtues, at any rate less perfidy and a far stronger patriotism. The preachers, the unfailing butt for Mr. Lang's ridicule, were, with all their intolerance and arrogance, at least honest and consistent; and in the absence of a regular political constitution or of other available modes for the expression of public opinion, it was not strange that they should endeavor to rouse and should claim to deliver the sentiment of the body of the people. There was, indeed, a Parliament and a sort of Constitution, but the principles of the national polity were far less definitely settled than was the case in England; and the Parliament was, even more frequently than in England, used as the tool of the faction dominant for the moment.

In two concluding chapters Mr. Lang gives a sketch of the state of the Highlands, where the Celtic clan system remained in full force, and of the social condition of the Lowlands. It is a somewhat meagre sketch, considering the width of the field to be surveyed; still, there are in

it several points of interest. Not only the Border, but many other parts of the country, were the scene of feuds and vendettas kept up from generation to generation. The people were extremely poor, and lived far more rudely than their contemporaries in England. Everything was backward, except education; for the number of persons who seem to have known Latin, and even some Greek, was large, considering the times, and Scottish scholars were already, like Scottish soldiers of fortune, wandering over Europe. There seem to have been few exports, except herring, at least if the laws which forbade corn and coal to be sent out of the country were really enforced. Nevertheless, and despite the incessant disorders and civil wars, the country throve and population increased. It had nearly a century of strife and suffering to undergo after James the Sixth succeeded to the throne of England before settled days arrived, and there were few signs whence any one could conjecture the prosperity which it was ultimately destined to attain. But its history had already taken that characteristic which made it unlike the history of England during the next two and a half centuries, viz., the predominance of ecclesiastical questions over purely political questions. The fierce struggles of the Reformation time turned the minds of the Lowland Scots into a theological channel, and it is only in our days that this propensity seems to have departed from the nation of John Knox and Andrew Melville.

LEE'S QUEEN VICTORIA.

Queen Victoria: A Biography. By Sidney Lee. The Macmillan Co.

There have been few more difficult tasks in biography than that which faced Mr. Sidney Lee when he undertook to prepare a memoir of Queen Victoria. In the first place, there was an immense mass of literary and journalistic material to be sifted. Then, it was necessary to preserve such a sense of proportion that the book would become neither a glorified Court Circular on the one hand nor a history of nineteenth-century British politics on the other. There was the further problem of dealing in a scientific spirit with the character of a personage whom her subjects had come not only to idealize, but almost to idolize.

In the present volume, which is an expansion of the notice appearing in the 'Dictionary of National Biography,' Mr. Lee has escaped from these dangers with remarkable skill. He has collected his information with diligence and judgment from many quarters. The footnotes refer us to such unexpected authorities as Lockhart's 'Life of Scott' and Mrs. Gaskell's 'Life of Charlotte Brontë.' Something is even gained from Charles Sumner's impressions of the Queen's utterance at the opening of the Parliamentary session of 1839, and from the observations taken of her at Ascot, before her accession, by N. P. Willis, who regretted that it would be the fate of so "pretty and interesting" a girl to be sold in marriage for political purposes without regard to her own wishes. But the multiplicity of memoranda never obstructs the easy flow of the narrative. The chronicle of royal progresses, etc., is by no means as tiresome as it might have been, and the details of national politics are introduced only to such a degree as was necessary to make intelligible the Queen's relation to public questions. So brief, for instance, is the account of the genesis of the Crimean war that it has no mention of Stratford Canning. To use the author's own illustration, he has subordinated the scenery to the actor. But Mr. Lee has been most conspicuously successful in resisting the temptation to write as a courtier. He says truly of Gen. Grey and Sir Theodore Martin, the Prince Consort's biographers, that they write from the Queen's point of view, and occasionally ignore the evidence of writers with whom the Queen was out of sympathy. This charge can scarcely be brought against Mr. Lee. His book appears in a sense to be issued under royal sanction, for he expresses his debt to the King for the use of an autograph and various portraits, but he depicts Her Majesty as a human being with the weaknesses to which our nature is prone. His tone is not at all as critical as that of the anonymous author of the famous *Quarterly Review* article; his comments are, nevertheless, not lacking in frankness.

Mr. Lee makes it clear that Queen Victoria displayed no special ability outside political management. "She was not conspicuously endowed with artistic taste." "She was not a good judge of painting." "Her personal interest in literature was not strong, and it diminished in later years; but she respected its producers and their influence." The names of her favorite writers make a motley list—Tennyson, Dickens, Samuel Smiles, George Macdonald, Florence Montgomery, and Marion Crawford. On some social questions she was violently prejudiced. Mr. Lee tells us that she was thoroughly and almost blindly antipathetic to the movement for the greater emancipation of women, and adds that "she never realized that her own position gave the advocates of Women's Rights their greatest argument; and when that point of view was pressed on her attention in conversation, she treated it as an irrelevance." She was opposed to the marriage of widows. It is curious to learn that, in spite of her close friendship with Tait and Benson, she was not in personal sympathy with bishops as a class, and that the tone and manner of Episcopal sermons were rarely simple or homely enough to suit her. She was "irritated" by extreme Ritualism, and showed her Scotch Presbyterian chaplains a cordiality which was rare in her attitude towards English clergy.

The record here given of Queen Victoria's influence on contemporary politics proves that her participation in affairs of state was much greater than was commonly supposed. Though not an absolute sovereign, she was a hard-working one. Up to the last she required to have all important papers submitted to her; she signed hundreds of documents daily, and would never countenance the proposal that she should employ a stamp; she discussed the qualifications of all persons nominated for high office; and she read most of the speeches made by cabinet ministers in the country, sending them autograph notes of congratulation when they especially pleased her. Mr. Lee does not hesitate to admit the Queen's strong political partisanship, and her frequent attempts to make national affairs move in the direction of her personal preferences, though he recognizes also the good sense with which she submitted to public opinion when she found that she could not have her own way. The story of the Queen's career, especially in its earlier periods, emphasizes the danger to which a country may be exposed in its foreign relations owing to dynastic alliances and sympathies. Another cause of trouble was the constant intervention of the Prince Consort in matters with which he had no right to meddle. As against the mischief done by these attempts at asserting personal authority, must be set the fact that on some occasions the self-assertion of the Queen and her husband had valuable results. After the Indian Mutiny, her alteration of the draft proclamation was of the highest importance, and the Prince Consort's recasting of Palmerston's *Trent* dispatch averted the risk of war between England and America. Mr. Lee quotes here Walt Whitman's note expressing American gratitude for an act which prevented a war that would have been unquestionably followed by a recognition of the Southern Confederacy by all the leading European nations.

Mr. Lee speaks in guarded terms of the Queen's attitude toward British politics after the Prince Consort's death, but the very reserve of his language makes the implied indictment the more severe. At the outset of her career it was the Tories with whom she was at war; long before its close she became an industrious opponent of the party of reform. The biographer himself holds that "her activity was in the main advantageous," but the evidence he has collected goes a long way to prove that, both in the things she did and in those she left undone, her influence upon English life during the last generation was in many respects far from wholesome. She neglected those social duties which were most incumbent upon her, and went out of her way to increase the popularity of policies of aggression and dishonor. It is difficult to read with patience the story of her infatuation for Disraeli, who, as Mr. Lee recounts, won her favor largely by amusing and flattering her, and the dislike and ingratitude she showed to Gladstone, who, apart from his services to the country, had suffered more than any other man of his time through persistent devotion to the interests of the Crown. Those who remember the Bulgarian atrocities will need no help to a judgment of the character of Her Majesty's influence when they learn that Mr. Gladstone's protests against them "exasperated" her and tightened the bond between her and Lord Beaconsfield, and that his Midlothian campaign in particular was denounced by her in her private letters as shameless and disgraceful. Private letters, perhaps, do not matter much, but the Queen was guilty of nothing less than a reckless misuse of her high position when she publicly fomented the agitation for war with Russia in behalf of the patron and employer of the Bashi-Bazuks. Mr. Lee confirms the general belief that Beaconsfield artfully encouraged her imperialistic tendencies, and that especially she received "immense satisfaction" from his ingenious device of creating her "Empress of India"—a title which Parliament was assured would be employed only in India and concerning Indian affairs, but which she used in signing all documents, Eng-

lish as well as Indian, within three years. We are told, by the way, that the Queen at first objected very strongly to the use of the word "Commonwealth" for the new Australian federation, as she identified the word with Cromwell and his republican form of Government.

Without discussing the permanence of the British monarchy, Mr. Lee affords material for estimating the changes made during the last reign in the monarch's prerogative. The personal authority of the Crown over the army was almost entirely dissolved by the deliberate action of Parliament; the Home Secretary superseded the sovereign in granting pardon to convicted criminals; the Prime Minister acquired in great measure the right of bestowing titles and honors; the Queen's discontinuance of the ancient practice of opening Parliament, and her frequent sojourns abroad, weakened the theory of her importance in the Government; and her neglect of Ireland, "which must be assigned to her personal feeling and care for her personal comfort at the cost of the public advantage, almost sapped the influence which the Crown can legitimately exert on the maintenance of a healthy harmony among the component parts of the United Kingdom." On the other hand, Queen Victoria's personal influence was far greater at the end of her life than at her accession. This was largely due to the length of her reign, which "rendered in course of years her personal experience of government far wider and far closer than that of any of her Ministers."

Every student of the public life of Great Britain in the nineteenth century—and, indeed, every student of political institutions in general—will have reason to be thankful to Mr. Sidney Lee for a book which is likely to remain for a long time the standard authority on the subject of which it treats. Its practical value is much increased by an unusually complete index and table of contents.

ROMAN EXCAVATIONS AND COLLECTIONS.

Storia degli Scavi di Roma, e Notizie intorno le Collezioni Romane di Antichità, da Rodolfo Lanciani. Vol. I. (A. D. 1000-1530). Rome: E. Loescher & Co. 1902.

The story of the resurrection of ancient Rome from her ruins is no less fascinating and romantic than that of the centuries of her glory and her downfall. But the details of this later story have been accessible to the student of history and of art only in small bits, and these scattered through many volumes, while original documents and archives are to him hopelessly sealed treasure-houses. Commendatore Lanciani has long enjoyed the reputation of being the man best acquainted with the documentary history of the long series of excavations that have yielded (and often, alas! destroyed) the clew to what is left of the art and the buildings of ancient Rome. A full quarter of a century ago he began the search through the libraries and the archives of various countries for all material that could bear upon this subject. Along with his study of the literature has gone that of the extant remains. The resultant material has been employed by him from time to time in a series of books and articles, some in English, some in Italian, some popular in character, and some technical, but all alike, in whichever language, written in a bright and graceful style quite removed from the ponderosity affected by, or afflicting, the ordinary writer on archæological themes. Commendatore Lanciani has, indeed, a talent and a taste for "hitting it off" with deft phrases and dramatic touches that are traditionally French rather than Italian. They remind one of the genial narrative traits of those delightful men of the Midi—"une espèce de mirage," says the inimitable Daudet. Some particularly strenuous archæologists have even gone so far as to affirm that Commendatore Lanciani is like Tacitus in being a better rhetorician than historian. But in the present volume, at least, we have no appearance of French kickshaws, but solid meat—or perhaps one might better say bones, though they are by no means dry bones. For here is the first instalment of the skeleton of a charming body of history.

Lanciani's most imposing work thus far has been his fairly monumental archæological map of the city of Rome, in more than twoscore large sheets, happily completed a year or two ago. To critics who have questioned his arrangement and disposition now and then of certain structures, he has promised to make his reasons clear in the long-promised history of the excavations, and he expresses the hope that his work will also be of service in tracing the provenience of many works of ancient art that have long adorned the museums of Europe. The collected material for this work now fills ninety-five thick volumes of manuscript, of which the first half alone contain some eighty-five thousand copied extracts, notes, and plans. And the essence of this is to be included in five annual volumes of print—truly a prodigious task of arrangement and condensation. One is reminded of the characterization by Catullus of the work of Nepos—

> "ausus es unus Italorum
> omne ævum tribus explicare cartis,
> doctis—Iuppiter!—et laboriosis."

The author has good reason for remarking that although his material can by no means be regarded as complete, he must sometime cease to collect and begin to publish, or his labors will meet a fate like that of the volumes of Don Ferrante.

The topographical field of the history is not confined to Rome alone, but extends over a very considerable adjacent area, from Alsium to Antium, from Ostia to Tivoli and Palestrina, from Veii to Tusculum and Nemi. Its chronological limits are from the beginning of the eleventh century to the overthrow of the papal dominion in 1870, the initial volume carrying the account as far as the reign of Clement VII. (1530).

The earliest excavations appear to have been executed in the great Thermæ in the search for bath-tubs of porphyry, or other rich material, to serve as coffins for the bones of saints and martyrs now transferred from the extra-mural cemeteries to city churches. Nor did some of the Popes disdain such final resting-places for themselves. Indeed, the bath-tubs furnished the pattern for coffins of much later date. But when it was found that actual sarcophagi could be disinterred from ancient cemeteries, and their former occupants evicted in favor of good Christians, these sarcophagi came into fashion, and excavations were conducted to find them. Perhaps the change to this more seemly fashion of entombment was also helped by the failure of supply of bath-tubs.

The necessary rebuilding of churches after the destruction that accompanied the Norman occupation of the city directed attention to the immense amount of admirable building material that lay ready at hand in the ancient ruins. So in the eleventh century began the work of dreadful havoc that raged with truly barbaric madness for more than half a millennium among the monuments of Rome's greatness. It has also had periods of recrudescence at intervals within quite recent times, like those which mark the slowly diminishing throes of a dying volcano. Every student will remember the fallen column half sawn asunder that lies within the precincts of Hadrian's temple of Venus and Rome, and preserves the precious memory of that doughty champion of antiquity who, not so many decades ago, proved his archæologic doctrine orthodox by apostolic blows and knocks, scattering to flight with his own hands and feet the vandalic workmen, who, after all, were but carrying out the orders of their superiors. Indeed, it is less than half a decade since one could see—perhaps they are still visible—big blocks of marble in the Roman Forum with the painted numbers upon them that marked them for use in the revamping of the Church of Sta. Maria in Cosmedin.

The ravages of the Barberini Urban that provoked even Pasquin to his well-known protest, "quod non fecerunt barbari fecerunt Barberini," do not come within the range of Lanciani's first volume, but there were barbarian Popes before Urban. They were doubtless properly Catholic in doctrine, and some of them one must charitably believe endued with innocency of life in other respects, but the perusal of this detailed record of their pernicious activity in excavation would tend to make the reader believe that there was none that did good. Occasionally some pontiff, for a reason of his own, solemnly forbade the devastation of ancient ruins, as did Pius II. by his bull *Cum almam nostram urbem*, in 1462; but that might well have been only to give himself a better chance, for Pius pulled down the eastern colonnade of Octavia's portico for use in building the pulpit of the benediction in St. Peter's, and plundered for the same purpose the Colosseum, the Baths of Caracalla, the northern parts of the Forum, the remains of long-suffering Ostia, and various other regions both within and without the city. And yet Pius II. (Æneas Silvius Piccolomini) was a student of archæology, and a writer on archæological subjects! Even the keen and businesslike Raphael, to whose appointment in 1515 as commissary of antiquities in succession to Fra Giocondo we owe the initiation of a great scheme for the scientific investigation and publication of the remnants of antiquity then existing, was unable to stop the ravenous devastation. Pope, Senator, and builders combined to make a clean sweep. What could be used as building-stone was dug up and carried off. Pieces of marble or travertine too small for this, or not of convenient shape (at times even statuary), were broken up and burned into lime on the floor of the ancient structures they had once adorned.

Yet even these centuries of destruction

were not all of them without cheerful features. Scholars began to study and to write as early as the fifteenth century, and collections of antiquities could be formed at comparatively little expense and with marvellous rapidity in an age in which so many virgin excavations were constantly going on. It is, indeed, the story of the origin of these famous collections that will attract the attention of many readers who have no especial interest in the problems of Roman topography on which this volume throws so much light. Almost every page has an item of marked interest, and in more than one instance popular misconceptions of the later history of important sites can be corrected from these notes. The six indexes (of ancient topography, of mediæval and modern topography, of churches, of museums, galleries, and libraries, of incidental matters, and of names) are not sufficient in fulness for such an encyclopædic work. For example, it is only under *Via Appia* that one finds a reference to that most amazing story of the discovery of the marvellously beautiful and perfectly preserved body of "Tullia, Cicero's daughter," over which all Rome went mad; it is only under *Domus Titi Imperatoris* that reference is made to the finding of the Laocoön: and so with other single objects. It would also add greatly to the interest of the work if some of the early sketches, plans, and other drawings of the ruins could be reproduced in it.

We have called the book a skeleton rather than a body of history, for in large measure it is, and perhaps must be, in order to embody the immense mass of valuable material, an annalistic arrangement of notebook extracts, with more connected sketches introduced here and there. The resulting book owes its engrossing interest more to the subject-matter than to the form, which lacks integral coherence about as much as the dictionary does. It is also not free from some of Lanciani's genial tendency to facile guesses and inferences, and the accuracy of the numberless extracts must evidently be taken for the most part on trust. But the work is immensely interesting, and will doubtless, with its succeeding volumes, earn by good title a place among the most permanently valuable books on the subjects it covers.

Samuel Richardson. By Austin Dobson. (English Men of Letters.) The Macmillan Co.

It may be supposable without offence that there are intelligent people in the world possessing some literary curiosity, to whom Samuel Richardson is only a famous name of rather vague association with English fiction. Such persons, coming to Mr. Dobson's book for justification of the fame, may be seriously disappointed. They may even henceforth think of Richardson, not as a great though unfamiliar novelist, but as an eighteenth-century printer who wrote several thousand letters and three novels now devoid of interest except to students of literature; who was vain, jealous, servile, spiteful, and not entirely beyond suspicion of a scandalous hypocrisy; whose fame was made in the beginning by a lot of silly hysterical women, and continued into a tradition by some hardly less hysterical Frenchmen.

Mr. Dobson has not made these harsh statements plainly (for his book is one of evidence and argument rather than a narrative with comment), but the burden of his evidence and the gist of his arguments may easily lead the comparatively ignorant to such conclusions. Though his attitude towards his author is distinctly unsympathetic, his method is perhaps most responsible for an apparent disparagement, both of the man and of the writer. It is not a synthetic method. He has made no effort to construct a character, nor cared at all about the impression of the whole. His chief solicitude is to exhibit, not the large aspects of his subject, but an immense amount of minute detail, and he sometimes abandons himself to a sort of antiquarian rage for magnifying matters of no importance or interest except to persons whose tastes and curiosities are similar to his own. For biography and literary criticism this method is not the best, because the heart of the matter is sacrificed to the unessential, if not the immaterial. In this matter, the essence, of course, is Richardson's important place in the history of literature, the originality of his work, and the extraordinary depth and precision of his intuitions in many directions.

Mr. Dobson grants his right to historical precedence, and once comes out quite handsomely about his originality. Having mentioned several reasons for the instant success of 'Pamela,' he concludes:

"But more than these things—more, even than its unconventional freshness, its appearance in a dead season of letters, its appeal to a new audience, and its proclamation of a mission—was the indisputable fact that it was itself a new thing . . . It was, we repeat, a new thing—destined, as its author foresaw, to inaugurate a new species of writing—the novel of sentimental analysis."

The question of Richardson's debt for 'Pamela' to Marivaux's 'Vie de Marianne' is, we think, settled in the negative by Mr. Dobson's array of evidence. Another dispute connected with the first novel is still open, for Mr. Dobson does not deny Fielding's authorship of 'The Apology for the Life of Mrs. Shamela Andrews,' but only doubts it enough to rebuke a writer "who has recently prefaced a new edition of Richardson's works and refers to the 'Apology' as 'Fielding's famous parody of Pamela.'" This is not the only disputed point on which Mr. Dobson's mind is not made up. He is very uncertain as to whether Richardson was most an artist or a moralist. Having expressed the opinion that the sequel to 'Pamela,' prolonging narrative as it did without fresh complications, was a mistake, he goes on: "Richardson, moralist first and novelist afterwards, did not clearly perceive this"; but later, when considering 'Clarissa,' we hear "that Richardson showed himself more of an artist and realist than the moralist he professed to be."

The question of the sincerity of Richardson's profession that he wrote to advance the cause of religion and virtue, is exhaustively considered. Many citations show that some contemporaries had suspicions as dark as those of subsequent critics, and Mr. Dobson does not find Richardson's own defence very conclusive against the accusation of being so "abnormally interested in certain forms of wrongdoing that he exhibited a more prurient preoccupation with undesirable details than is generally exhibited by a moralist." Probably one could not be an effective moralist unless one were deeply interested in vice; and to have their sincerity questioned seems to be the price that determined moralists who are also determined novelists have to pay for their fame. As moralists, they may direct the creative impulse, but as artists they are controlled by it. So far as they can explain their motives they are probably sincere, and one must charitably strain such explanation to cover that part of their work which they do without knowing why or how.

The chapters given to Richardson's correspondence are very entertaining, and go to show the novelist's dependence on the opinions and suggestions of his friends, who, after the appearance of 'Pamela,' persistently instigated his further production of fiction. Mr. Dobson has dipped deep into the unpublished letters in South Kensington Museum and pulled out plums. The "corresponding people" are mostly women, some of them very lively. Mrs. Pilkington, having heard that 'Clarissa' is not to have a happy ending, and having communicated the sad news to Colley Cibber, who becomes violently inconsolable, writes to the author: "Spare her virgin purity, dear sir, spare it! Consider if this wounds both Mr. Cibber and me (who neither of us set up for immaculate chastity), what must it do with those who possess that inestimable treasure?" Mrs. Belfour (Lady Bradshaigh) writes less frankly, but with great excitement on the same subject. Lady Bradshaigh was among the silliest of women, and lived to the age of eighty. Miss Sarah Westcomb, a priggish young person, interrupts her edifying discourse to score the "beautiful Gunnings," and Mrs. Donellan has no scruples about ingratiating herself by barefaced abuse of Richardson's rival, Fielding. The most attractive of these worshippers is Mrs. Klopstock, the wife of the author of the 'Messiah.' Her letter describing her own falling-in-love and married life is exquisitely ingenuous and tender.

It is in the exhibition of Richardson's hatred of Fielding, dislike for Pope, and, indeed, for all reputable literary contemporaries, that Mr. Dobson's unsympathetic view shines out clearly. Doubtless Richardson had a contemptible fear that the prize of distinction won so late in life might be wrested from him, but he was old and nervous and thoroughly a person of the middle class, and, more than all, the novel was his discovery. Mr. Dobson makes little allowance for very natural failings, takes pains to point out his author's avidity for flattery of the grossest sort, and dwells upon his childish joy in the notice of persons of superior social position. He, indeed, devotes two or three pages to arguing that Richardson's great acquaintances were not nearly so great as he imagined. Mr. Dobson's literary criticism is of the accepted order, and, as in characterization, he lays more stress on obvious defects than on distinguished merits.

Letters from the East, 1837-1857. By H. J. Ross. London: Dent & Co.; New York: E. P. Dutton & Co. 1902. Pp. xiv, 332.

From a son-in-law of Lady Duff Gordon it somehow seems only right to receive vivid and pointed letters, and in a man whom Sir Stratford Canning picked out as

having a future in Eastern politics, business ability and clear observation might safely be expected. So these letters, while without any literary pretensions, are singularly direct and picturesque, and the writer himself is an excellent example of the men whose practical genius built up English trade in the Levant, and whose Oriental sympathies and insight watched English interests there as consuls.

The book begins with a reminiscence of Disraeli at Malta in 1832, accompanied by N. P. Willis and "dressed in a silk dressing-gown with a guitar suspended by a broad riband round his neck," and ends with a picture of Mr. Ross in his old days in his Florentine villa, telling tales of the East and cultivating orchids. The pity is that the tale-telling did not reach more permanent form, and that all we now have of it is this tiny bundle of letters stretching loosely through a couple of decades. These record his wanderings, partly as merchant, partly as consular officer, through Asia Minor, down as far as Bagdad and Egypt and up to the Crimea. The time is that golden period for the fortune-maker immediately preceding and following the Crimean war. He was lucky, too, in place. He was at Mosul during Layard's first excavations; went through the Tiyary mountains after the Nestorian massacre, forgotten now, but full of trouble in its day; was thereafter in business at Samsoon under the stimulus of the Crimean war; later, had charge of the auctioning off of the baggage animals gathered for the English army, travelling for the purpose from Samsoon across the mountains into Syria.

In all the letters there is a singular richness of contemporary and permanent value; little of the commonplace; even less that time has disproved. Few letters could stand this test better. The war in the Crimea, with its criminal blundering and neglect, and, finally, the extraordinary arising to the crisis in the end, so characteristic of England; the paper character of the *Hatti Humayun*, and the change of the Turkish attitude with the withdrawal of the allied armies; the certain wealth of the country under any decent government, and the absolute necessity of consuls scattered through it if any reforms were to be carried out—all stand out clearly, especially the last. Mr. Ross magnifies the consular office and evidently with right. Some things here would almost seem to be written in the light of the Armenian disasters which followed Mr. Gladstone's cheese-paring withdrawal of the consuls placed there under the Treaty of Berlin. On only one point a difference must be marked. In the fifties, apparently, there was little if any of the pan-Islamic spirit which is now so growingly powerful. The Turks of Asia Minor would hardly now invite occupation of the country by England.

But there are lighter things. We have Paul Botta most libellously portrayed with opium and mad reports; the Rev. Percy Badger parading the streets of Mosul in many-colored raiment, and showing the natives how the English clergy dress; the last of the knights of Malta in a green coat and silk stockings; and Mrs. Digby, the divorced wife of Lord Ellenborough, living in mingled state at Damascus, and trying her last matrimonial experiment with an Arab Sheykh. From first to last, this is a brilliant and delightful book.

A History and Description of English Porcelain. By William Burton, F.C.S. Containing twenty-four plates in colors, together with eleven plates of marks printed in colors and gold, and numerous illustrations. London: Cassell & Co.; New York: A. Wessels Co. 1902.

It is very unusual to meet with an intelligent book on the ceramic art, or any special department of it. The great number of handbooks and descriptive treatises, lists of "marks and monograms," of treatises on the "arts of clay," and on the decorative treatment of clay vessels, is not yet sufficiently great to include more than two or three books written with abundant knowledge and still in a thorough and considerate fashion. Such a book we have now in Burton's account of English porcelain, and, in spite of the unattractive pictures, it is an important book to possess and a most instructive book to study. Even as to the pictures, made either by the three-color process, as yet only half-understood by most of those who utilize it, or by the half-tone process, not very perfectly managed, they are authentic. They show to the trained observer what the original pieces must be like. Through the feeble gradations of the black-and-white print, or the really disagreeable combinations of raw primitive colors in the chromatic print, there is to be seen, by those who have become at all familiar with such porcelain, much of the quality and character of the piece. We see where the lips of a statuette are painted too strong and pronounced a red, where the eye-brows are pencilled much too hard and sharp, where the ear-ring clings to the cheek and shows too plainly as a mere relief touched with gold. We see that the border of the Coalport plate is laid on in strong blue with medallions left in white, each of which is filled by a picture of one of the barbaric "jewels" of Russian orders of honor. We see, always with the help of the descriptive text, just what is the character of the Derby plate, painted by Askew, with a realistically treated group of children playing with lambs. All of that we see in the black-and-white prints; as for the colored plates, they tell their story with a visible verity as uncompromising as disagreeable. A richly colored piece of English porcelain is not often a dream of delight to one who has frequented the school of Oriental porcelain or of Levantine glazed pottery, or of eighteenth-century French faïence; the islander's work is apt to be hard and crude, and the respect shown this and that master of ceramic decoration in England no longer seems exaggerated when his achievements are compared with those of ordinary English makers.

Still dwelling on the illustrations and on the wares which they represent, there are one or two exceptional pieces, or varieties, which may be named. Thus, the last plate but one gives a group of ruby and *sang-de-bœuf* vases by Bernard Moore of Longton, a living artist, for a knowledge of whose name and productions we have to thank Mr. Burton. Plate XXIII. and figure 85 give specimens of that *pâte-sur-pâte* work of M. L. Solon, which that famous artist has executed for the Minton establishment during the last twenty years, and in this case at least the colored plate gives a good idea of the appearance and decorative character of the not common method of painting in slip, as well as the hard facts concerning the shape and general color-scheme of the piece. These are recent wares. The magnificent covered vase of Worcester porcelain which is here called a "tea-poy" (by which term the world of collectors denotes generally a little table), and which is shown in Plate XVI., is calculated to raise one's general ideas of the artistic value of English ceramics. Plate XIX. shows two admirable cups and saucers of fine old Bristol ware, collectors' treasures, if there ever were any; and a whole series of the uncolored figures presents perhaps a sufficient representative selection of the table ornaments, the little statuettes and groups with or without elaborate flower accompaniments, rocks and trees, and the like, which are seen here to have been quite characteristic of certain of the many English porcelain factories of old time.

This account of the illustrations may serve to set forth the contents of the work, which will be found upon examination to be very logically arranged. A quite complete system of cross-references, and these not to the text only but also to the illustrations even when they are directly opposite the description, increases the general appearance of careful preparation—a thing which is rare in books on decorative art of any sort. In the present work, however, this is only the completing of what is undertaken in a thorough way, and so conducted from the beginning to the end. The satisfactory assurances with which the undue claims of Lowestoft are brushed aside, the serious criticism given to the much over-praised decoration of the Worcester pieces of supposed Oriental design, and many such rewarding discoveries which await him who will read these pages carefully, are only to be surpassed by the account given in Chapters I., II., and III. of porcelain itself, its peculiarities of material and manufacture, its attempted production in continental Europe and in England, and its many modifications in later times. Read those chapter and follow them up by Chapter XV., in which are described the "Glassy Porcelains of the Nineteenth Century," and you will know more about the chief of all ceramic wares than was known before the appearance of this book to any except some life-long student, such as Mr. Burton himself.

A very brief glossary completes the treatise, because, though there are too few titles given, yet they are greatly needed—their explanation being hardly discoverable in the dictionaries, general or special; and because both terms and definitions are so evidently the work of one who knows the subject practically. There are references from the glossary to the body of the work, and all that could be wished for it is greater completeness on the same lines.

The Diamond Mines of South Africa: Some Account of their Rise and Development. By Gardner F. Williams, M.A., General Manager of De Beers Consolidated Mines, Limited. The Macmillan Co. 1902.

In nineteen chapters, Mr. Williams tells the story of diamonds, diamond seeking, cutting, and polishing, from legendary times down through historical periods, ending with the method of operating the consolidated mines of South Africa of to-day. The first chapter, "The Ancient Adamas," gives

an illustrated description of some of the famous gems for which wars have been waged and dynasties overturned; and the adventures through which these historical diamonds have passed, their travels, loss, and recovery, seem, in the telling, like extracts from the Arabian Nights. The illustrations of the gems in this chapter give a good idea of their shape and actual size, but the facets are not well shown, being quite indistinct.

In chapter ii., "Traditional Ophir Land," Mr. Williams collects and discusses a large body of legend, tradition, and history in attempting to locate King Solomon's mines, the home of Queen of Sheba and the legendary land of Ophir, and his conclusion is probably correct, that the gold poured so lavishly into the coffers of the King of Israel came from southeastern Africa, north of the Limpopo River in modern Rhodesia; Ophir being merely the port on the southern coast of Arabia through which the gold brought by sea to that point was distributed.

"The Pioneer Advance," chapter iii., is a picturesque account of the state of South Africa, the rigidly unchanging character of the sparse Dutch population, set amid Guinea slaves and barbarous native tribes, their deep resentment at British control, their exodus through an unknown wilderness into a country populous with savages ready and strong to resist intrusion. Chapter iv. relates the story of a discovery, apparently unimportant, but with consequences completely altering the destiny of South Africa. In 1867 a diamond was picked up on the bank of the Orange River, weighing twenty-one and a half carats, bought afterwards by the Governor of Cape Colony, Sir Philip Wodehouse, for five hundred pounds sterling; and the finding of this stone was the actual beginning of conditions leading to the final clash between the English and Dutch in Africa, the destruction of two republics, and the addition of their territory to the British empire. By the rush which quickly ensued to the Orange and Vaal Rivers, the slow-moving Dutch farmer, with ideas belonging rather to the fifteenth than to the twentieth century, whose dream of prosperity was completely realized in the possession of troops of children, numerous slaves, and flocks and herds covering every kopje and valley of the desolate veld he claimed as his farmstead, was brought into direct contact with an eager, striving, bustling people, knowing little of and caring less for the deliberate, plodding, Dutch way of attaining Dutch success. It was inevitable that a conflict should come; it was equally inevitable that the fifteenth century should give way to the tumultuous onset of the twentieth. Mr. Williams exhibits the continual difficulties besetting the miners while they clung to the old fashion of open mining—the falling in of the walls (or "reef") surrounding the mines, to be removed at an expense of millions from the diamond-bearing ground by British indomitableness. Especially interesting is his estimate (p. 274) of the character of the two men, Cecil John Rhodes and Barnett Barnato, who were the principal movers in the exceedingly difficult and delicate task of gaining control of the innumerable small claims in the mines, in order to consolidate the whole under one company and head, so that work could be carried on at much less expense and far greater profit. In a few masterly touches both of these strong and in a sense "necessary" men are set before the reader, and their similar and unlike traits of character brought out clearly and simply.

Chapter xix., "An Uplifting Power," shows what an irresistible impulse the finding of diamonds gave to every industry in South Africa. The inflocking of multitudes of gem-seekers necessitated the carrying of supplies of all kinds in ever increasing quantities; from this necessity came railways and better common roads, and by means of these civilization spread from Cape Colony a long way toward central Africa and the equator. A graphic description of the siege of Kimberley will be found in the appendix. It reads like a chaptre from Motley's 'Rise of the Dutch Republic.' The same invincible courage, a like inability to imagine defeat or surrender in spite of apparently inadequate means of defence, animated the defenders of Kimberley as they did the garrisons of Alkmaar and Leyden. The miners were drilled into soldiers, and the mechanics became skilled makers of ordnance. The mounds of tailings from the washing mills were occupied by redoubts, and dynamite mines were planted at their bases. The bombardment began on November 6, 1899, and continued for one hundred and twenty-four days.

Mr. Williams's book contains a mass of authoritative information, historical and technical, arranged in a form very convenient for reference.

Mediæval Stories. By Prof. H. Schück. Translated from the Swedish by W. F. Harvey. Illustrated by W. Heath Robinson. London: Sands & Co.; New York: Charles Scribner's Sons. 1902. Pp. i.-xviii., 1-321.

Mediæval stories are now apparently more popular among us than they have been for centuries. One collection follows another rapidly in varying style; yet nobody shows any disposition to cry enough. And naturally so, for an alluring glamour has ever surrounded ancient fable, and the tales of the Middle Ages reveal to us the charm of the poetic life that men then lived. Properly considered, they are valuable, not merely as a wholesome stimulus to the imaginations of the young (for whose reading they are nowadays chiefly prepared), but also as records worthy of serious consideration by learned men. It is in ignorance or unwisdom that students of literature and history have often treated them with disregard; for they reflect now, as formerly they helped to establish, romantic ideals of conduct which continuously and long affected national tendency, and not infrequently determined political issues.

In preparing the collection before us, Professor Schück, an eminent Swedish critic, was actuated by a desire to restore to the youth of his land some of the famous tales once widely current there, though not of Swedish origin, and chose for his purpose the following, which he freely recast: "Flores and Blancheflor," "Duke Frederick," "Karl and Alegast," "The Journey to Constantinople," "Roland," "The Seven Wise Masters" (a collection in itself of fifteen stories, not all primitive), and "Amicus and Amelius." No reason is manifest, except the translator's convenience, for perpetuating this particular book in English. The stories are excellent; they should be familiar to English readers; they are pleasantly told by Professor Schück, and, on the whole, well translated; but it were preferable for us to have them either in their best available forms or in native English redactions. As it is, the roundabout process of their production has led to an unfortunate situation, which should have been avoided. Names of well-known heroes confront us disagreeably in Swedish disguise. It is a pity for children to become acquainted with the Knight of the Lion by the corrupted name of John instead of Ywain (Owen), or to learn to call Amicus and Amelius the sworn brothers whom we are familiar with as Amis and Amiloun (Amiles); and it is quite indefensible to tell them stories of Karl the Great instead of Charlemagne. Had a volume of the same tales (interesting all of them, and some nowhere else easily accessible in popular form) been collected from purer versions, we should have welcomed it more cordially; still, the book as we have it will do good service, and may be commended to our readers.

Round the Horn before the Mast. By Basil Lubbock. E. P. Dutton & Co.

The success of Mr. W. Clark Russell's marine stories has inspired much writing among the many equipped with a practical or theoretical knowledge of sea life. In most cases the imagination is largely drawn upon to eke out an impoverished store of facts. There are two exceptions to this assertion: the one, Captain Slocum's 'Around the World in a Yawl,' and the other Mr. Lubbock's 'Round the Horn before the Mast.' Each of these offers indisputable evidence of being a truthful recital of personal experiences; condensed from carefully kept records rather than enlarged from slender resources and with painful effort in order to satisfy commercial exigencies.

Mr. Lubbock's book is the work of an Englishman of roving impulse and an adventurous past. After exploring the Klondike, apparently without profit, he comes to San Francisco, where he is filled with a desire to ship before the mast and witness sea life in all its dangers and hardships. To this end he signs on board the four-masted steel barque *Royalshire*, bound from San Francisco for Liverpool. Mr. Lubbock had had no previous experience of sea life beyond that gained on sailing-yachts in smooth waters; consequently he shipped as a green hand or landsman, and with full knowledge of the perils which awaited him in that capacity on a deep-water square-rigger. Among his other accomplishments he appears to include photography, if we may judge from the character of the illustrations which accompany the letterpress. Among these are two or three pictures of ships at sea under full sail, coming bow on. One, which will prove of particular interest to the deep-water sailorman, is a view taken from the after or poop deck representing shifting-sail in preparation for hard weather in rounding Cape Horn.

The narrative of life before the mast on the long voyage from San Francisco to Liverpool leaves nothing unrecorded. For details and incidents we must refer our

readers to the book. There is mentioned, casually, one happening—condensed in a brief paragraph—which would almost furnish a plot for the imaginative sea story as it comes to us in these days. This was a sailor's loss of a full set of false teeth, rolled out of his mouth while aloft on the main upper topsail yard. Some old down-east skippers were so provided, but never before have we heard of a man before the mast venturing aloft with such a necessary and useful personal possession in his mouth. While Mr. Lubbock's book will interest adults, it will prove irresistibly attractive and instructive to youths who have romantic notions in regard to the free and joyous life of him who follows the sea.

The Nation

VOL. LXXVI—NO. 1966. THURSDAY, MARCH 5, 1903. PRICE TEN CENTS.

An Interesting and Timely Book

American Diplomacy in the Orient

By JOHN W. FOSTER

Ex-Secretary of State of the United States and Author of "A Century of American Diplomacy, 1776-1876."

8vo, $3.00 net. Postpaid, $3.20

MR. FOSTER'S book is designed to show the part which the United States has taken, and the position it now occupies, in respect to the political, commercial, and race questions in the Orient. It reviews the early American commercial intercourse with China, the opening of Japan, the political history and annexation of Hawaii, and the relation of the United States to other countries of the Pacific. Mr. Foster pays special attention to the results of the Spanish War in the Far East, and shows the honorable part the United States has borne in the stirring events of the Pacific.

Two Novels of Colliery Life and Its Disturbances

A Daughter of the Pit

By MARGARET DOYLE JACKSON.

Crown 8vo, $1.50.

"Rarely does it fall to the reviewer's lot to have a story of such compelling interest to read."—*Philadelphia Telegraph.*

The Lieutenant-Governor

By GUY WETMORE CARRYL

Crown 8vo, $1.50.

"Its plot is new, its situations dramatic, and it is continually interesting."—*Boston Transcript.* (*Ready March 14th.*)

An Important Biography

William Ellery Channing.

By JOHN WHITE CHADWICK.

With two photogravure portraits. Crown 8vo, $1.75, *net.* Postage extra.

THE career of the great Liberal leader is drawn with the sure touch and full mastery of material that have already given distinction to Dr. Chadwick's portrait of Theodore Parker. (*Ready March 14th.*)

The Constitutional Ethics of Secession, and War Is Hell

By CHARLES FRANCIS ADAMS

Paper, crown 8vo, 25 cents *net.* Postage extra.

Two recent speeches by Mr. Adams, which have aroused much discussion. (*Ready March 14th.*)

The Poets of Transcendentalism

AN ANTHOLOGY

Edited by GEORGE WILLIS COOKE, with an Introductory Essay and Biographical Notes. Large Crown 8vo, $2.00, *net.* Postage extra.

A collection, for the first time, of the best verse produced during the period of American literature which saw the rise of the transcendental movement. (*Ready March 14th.*)

Letters to Washington

Edited by Stanislaus M. Hamilton

PUBLISHED FOR THE COLONIAL DAMES OF AMERICA

The letters cover a period from 1752-1775 and are from men of different historical importance, but all are of positive value to students of history. Large crown 8vo, each $5.00, *net.* The set, $25.00, *net.* *Volume V. ready.*

The Nation.

NEW YORK, THURSDAY, MARCH 5, 1903.

The Week.

On Monday night Congress was in a mood akin to that of Donnybrook Fair, "Wherever you see a head, hit it." The Aldrich bill was the first to receive the compliments of the season, nearly all the Democrats joining in the testimonial. Senator Morgan came out strong as a cunctator, putting in a two hours' speech where it could serve no other purpose than to prevent a vote. Some slight attempts were made to cast blame on Senator Quay and the Statehood bill which have used up so much of the time of the session; but the pen of history, if it concerns itself at all with Mr. Aldrich's bill, will place the responsibility at his own door. He has been a member of the Senate for twenty-one years. He has been Chairman of the Finance Committee a large part of that time. Nothing has prevented him from bringing forward a measure of this kind. If it were a desirable measure, he could have introduced it in his younger days and prepared the way for its passage. But, supposing that Mr. Aldrich received his first enlightenment from the Chamber of Commerce resolution of last December, asking for a measure of this kind, why did he waste his opportunities through the whole month of January? There was plenty of time to have passed this measure if he had begun early, and before the usual ice-gorge of the closing session formed. If the bill is lost he may thank himself for the result.

President Roosevelt's latest letter in explanation of his policy of negro appointments shows that he is determined to hold the impregnable position he has taken. Color shall be no bar to office. Neither shall it be a claim to office. Fitness, as demonstrated by intelligence, character, and capacity, with no exclusion on account of creed or color—what other standard is defensible in a democracy? Mr. Roosevelt is not moved by the clamor which his course in this particular has aroused. He has taken his stand, and, as it is upon a vital principle, he will not retreat. His firmness and courage are admirable, yet we must think him a little innocent for wondering why his effort to be just to an inferior race has excited such an outcry. What has changed, he asks by implication, since the Republican party and the country were committed to the doctrine which he now lays down? The South gives him his answer. It tells him that our treatment of an inferior race across the sea has encouraged certain men to believe that an inferior race may be oppressed in our own land. They would commend to the lips of the negro the chalice which Mr. Roosevelt has helped press to the lips of the Filipino. What the astonished President sees is only our injustice abroad returning to plague us at home.

Secretary Root has made short work of the Isle of Pines filibusters. To the Senate resolution asking about the status of that bit of Cuban territory, and of the American citizens resident therein, the Secretary replies that the island is under the government of the republic of Cuba, and that the Americans living on it are in the same position as other foreigners. The Isle of Pines was turned over to President Palma by Gen. Wood, and under Cuban jurisdiction it remains, with all its inhabitants—Platt amendments and Congressional resolutions to the contrary notwithstanding. That is the law of the matter, as laid down by Mr. Root, and the morals of the business are like unto it. We have no occasion, under any specious plea, of yielding to any artificial movement got up among Americans on the Isle of Pines, and meddling with that bit of property any more than with any other thing that is our neighbor's. To claim it would be a fraud, and to take it nothing but robbery. It is refreshing to have the War Department maintain the only correct position in this affair. That monograph on the Isle of Pines which was prepared under the direction of the Secretary of War, and which set forth the resources of the island so temptingly, led some to fear that the Administration was preparing a Naboth's vineyard to seize. That unpleasant apprehension has now been dispelled by Mr. Root's clear-cut disavowal of any shadow of right in the premises, or of any lurking covetous intent.

What the Cuban Treasury has done to improve its situation since May 1, 1902, may be shown in a brief statement. Gen. Brooke, at the end of his term as Military Governor, turned over to the island's funds nearly $2,000,000. During the two years of Gen. Wood's administration, this surplus was cut down to about $540,000—in other words, his two years showed a deficit of some $1,400,000. Yet in the first eight months after President Palma took office, and that under most trying circumstances, the deficit was turned into a surplus of $1,500,000, so that the available cash on hand is again in the neighborhood of $2,000,000. If such a result, attained on the basis of practically the same revenue and without curtailing the public service, had been achieved by an Anglo-Saxon President, we should have thought it looked very like a genius for finance. The Havana correspondent of the London *Times* has been pointing out these and the other proofs of fitness of the Cubans to govern themselves, despite the widespread impression in Europe and the United States that they were not fit. He dwells on their patience in adversity, their remarkable recuperative power, and the extraordinary way in which they have brought their chief industries through the ravages of war and the following severe depression. The plain truth is that Cuba to-day, with the higher price now ruling for sugar, is less in need of reciprocity with us than we are with her. We take 84 per cent. of her exports, tariff or no tariff, but sell her only about 30 per cent. of her imports, despite our enormous advantage of location. The reduced rates held out to our merchants in the pending treaty are, therefore, a plain offer of a greatly enlarged trade. Is a sullen and entrenched protectionism in Congress to prove again too powerful for the advocates of an enlightened and profitable policy of cultivating foreign trade?

On the ninth of February Senator Rawlins offered a resolution in the Senate calling on the War Department for the records of certain courts-martial in the Philippines where American soldiers had been placed on trial for barbarous practices. The resolution was, on motion of Mr. Lodge, referred to the Committee on the Philippines, of which he is chairman. It was reported back on the 21st with an amendment calling for nothing but a bare summary of the courts-martial. In this form every convenience will be offered for the suppression of disagreeable facts. The course of the Department touching this particular branch of its business has been marked by concealment and duplicity. There is not a more shameful page in our history. Nothing so much needs turning inside out as the court-martial records, unless it be an exposure of the cases of barbarity that never were tried. Of the latter, nothing will be known positively until the last trump sounds. Of the former we shall know only so much as Mr. Lodge and Mr. Root and President Roosevelt think will not hurt the party. There is no other reason for withholding these records. It would be interesting to learn, for instance, what reason, if any, existed for commuting the sentence of Lieut. Preston Brown, who was duly convicted by his brother officers of killing "an unarmed, unresisting Filipino, name unknown, a prisoner of war in his charge," and sentenced to be dismissed from the service of the United States and confined at hard labor for five years. This man's sentence was

commuted by the President to a loss of thirty points in his line of promotion, and he was restored to the service without other punishment. When this travesty of justice was announced it was said that there were "mitigating circumstances." If there were any such, they would undoubtedly be found in the records of the court-martial. If there were none, that defect would be made manifest. The Preston Brown case is only one of a large number of sealed books which ought to be opened.

From all that we can learn, it is clear that Gen. Grosvenor's book venture seriously disabled him as a subsidy-promoter. His own associates were naturally shy of tying their fortunes to a man whose check from J. P. Morgan, in facsimile, was already in great demand in Democratic districts. As one Washington correspondent put it, in spite of all Grosvenor's angry and virtuous denials he "was caught with the goods on," and the fac-simile of his own letter and of his checks "squelched him and silenced his batteries." Certainly, they have been extraordinarily silent ever since the *Evening Post* was able to confute him out of his own mouth. It was obvious, in the result, that in trying to serve himself too carefully, he made it impossible to serve the Shipping Trust. Republican managers shrank back in dismay at the thought of a subsidy engineered by Grosvenor, with his facsimiles certain to flood the country. In this connection, none but the hypercritical will see anything significant in the news from Iowa that Speaker Henderson, whose conversion to the subsidy plan has been made public, is, on retirement, to become "chief counsel for a steamship company." That would be a mere undesigned coincidence.

Party spirit may perhaps condone the action of the Regular Republicans in Delaware in choosing an Addicks man for Senator in order to beat Addicks himself, and to secure both the seats for men who wear their own party label. But decent people who have watched the fight from a distance will condemn such a compromise in the severest terms. To take a tool of Addicks instead of Addicks himself does not make for righteousness. On the contrary, it enables Addicks to claim that his doings have been endorsed by the Republican party. Dispatches from Dover say that he is intensely disappointed at the result, but we do not see why he should be. He had no standing before among the decent people of the State. Now he is recognized in the person of his man Allee, who gets the long term, as the real leader of the party. His views—that is, his dollars—will now receive consideration in many places where they have hitherto been spurned, and there is too much reason to apprehend that he will come back stronger than he is to-day. If Addicks is to be beaten in the next fight he must be beaten by Democrats, not by weak-kneed Republicans.

Union lawlessness did its perfect work in West Virginia on February 25. Armed strikers defied the Federal authorities. "To hell with the Government," they shouted, when told that it was a writ of a United States Court which the Federal officers wanted to serve upon them. Your injunctions do not go here, they maintained, in imitation of John Y. McKane. Under such circumstances there was nothing to do but to enforce the law at all hazards. Parleying with a mob is always dangerous, but parleying with defiant strikers who resist the peaceful operation of the law, with rifles in their hands, would be madness in such a state of frenzied opinion as the United Mine Workers have encouraged in West Virginia. The blood of the slain miners is upon the heads of their reckless leaders —and also upon their weak apologists. Yet even their counsel, Mr. Darrow, would shrink, we dare say, from pointing to the unhappy "environment" of these rioters as their sufficient excuse. The affair became really a battle between an oligarchy setting itself up as superior to the laws of the nation, and the resolute officers of the court. The latter conquered, though at fearful cost. But the lesson they taught is worth any price. Violence by strikers must be put down with a hard hand. It is the prime duty to society.

If the labor union leaders at Schenectady think that, by securing a special dispensation permitting the reinstatement of Potter, they can quiet the storm of protest aroused by his expulsion because of membership in the National Guard, they are likely to find themselves greatly mistaken. The dispatches say that the Vice-President of the International Painters' Union is convinced that the Potter case has "injured the organization more than anything else that could happen to it." Doubtless this is true. His remedy apparently is to settle this particular case. But he ought to see that Potter's reinstatement will be nothing if the spirit which prompted his expulsion is still to prevail. The constitution of the International Painters' Union prohibits its members from belonging to the State militia. While this provision remains and is upheld by the leaders, the reinstatement of a hundred expelled militiamen whose cases become objects of public attention will do no good. It will be too plain that what the labor men seek is not to deal fairly with the State, as patriotic citizens, but merely to avoid punishment, and, perhaps, hostile legislation resulting from their disloyalty. The Painters' Union, like others of its kind, has taken a position which is untenable, as well as wicked. It cannot avoid further attack by a partial retreat.

If John Mitchell is to go the way of all previous labor leaders, and break his neck by running against the stone wall of public opinion, he could not hit upon a surer road to ruin than his reported plan of a universal boycott of non-union goods. His idea is to get up a gigantic combination among trades unions, each of which shall refuse, not only to buy, but to work with, or to allow public authorities to contract for, non-union products. On Thursday there was seen in Chicago the beginning of the execution of this scheme. A delegation of labor leaders, headed by Samuel Gompers, went to the Mayor to protest against the city's using coal mined by non-union labor. This is one wing of the battle which the Mine Workers' Union is waging in order to unionize the mines in West Virginia. The other wing is on the spot, and carries rifles and shoots Federal marshals. What does it matter that Chicago buys its coal by public contract? We have got far beyond the notion that a municipal contract may be awarded to the man who, at the lowest price, will furnish the article desired. Has it the union label? If not, the city authorities are "enemies of labor," and are to be threatened with electoral punishment. And a club is also to be held over the heads of private employers. Their clerks, their artisans, will drop work and leave them in the lurch if one shred or stick of accursed non-union material is put into their hands. The whole world must be pasted over, "Union-made." This will be done, however, only when men have learned to hate liberty and to love tyranny.

A considerable part of the muddle in the New York Legislature over the tax measures is doubtless due to a confusion of terms. Gov. Odell considers any tax, not a direct levy on the property valuation of the counties, an indirect tax. But this is so only in the most technical sense. Originally, the scheme to abolish the direct State tax was announced as a plan to relieve real estate of all but its local burdens. This has been the effect of indirect taxation for the support of government in other States. But a glance at the tax measures now proposed by the Governor will show how far he has wandered from this idea. The proposed mortgage tax, as we have shown, is essentially a burden upon real estate; the bill to place a stamp tax on real property conveyance is, of course, of the same quality; and the amendment of the inheritance tax which has passed the Senate and was the least opposed of the various revenue measures, proposes to compel real property transferred by

inheritance to a lineal descendant to pay its percentage to the State. Such transfers are exempt under the present inheritance-tax law. In other words, the only revenue bills now proposed, for the purpose of carrying out the Governor's determination permanently to abolish direct taxation, are measures putting additional burdens upon real property.

Those members who profess to favor a waterway between Lake Erie or Lake Ontario and the Hudson, but who assert that it ought to be a ship canal, and that the United States Government ought to construct it, will do well to give some attention to the views of Mr. Gustav H. Schwab, expressed in a letter to the *Tribune* of Monday. The argument in favor of the ship canal is that, by means of it, grain could be transported from the Western lake ports without the expense of breaking bulk at Buffalo. The answer of Mr. Schwab, who is an expert in such matters, is that nothing would be gained by this, on account of the conditions which obtain at this port. At present, grain is taken from lake steamers at Buffalo by elevators, and from these loaded upon canalboats by mechanical means. The canalboat, on reaching this port, goes alongside the ocean steamer and transfers its grain by means of a floating elevator. If a twenty-one-foot ship canal permitted the lake steamer to come through to New York, the breaking of bulk which now takes place at Buffalo would be necessary here. The lake steamers, according to Mr. Schwab, could not transfer directly to the ocean carrier, but would have to unload to lighters, and they would then perform the same service as the canalboat. The difference would be that, all charges here being higher than at Buffalo, the latter method would be the more expensive of the two. This practical objection supplements in an important manner the well-known argument, apparently ignored by the ship-canal advocates, that to send lake steamers through a long waterway much more satisfactorily traversed by canalboats would be a flagrant example of economic waste.

The United States Supreme Court made a decision last week which appears greatly to extend the power of the States to protect either natural or urban sites of exceptional beauty. The case before the Court was that of the Westminster Chambers on Copley Square, Boston. When this building was in process of construction, a bill was passed by the Legislature limiting the height of buildings on the square to ninety feet. The owners of the building fought the bill in the courts on the ground, first, that its application to the Westminster Chambers was retroactive; and, second, that it violated the general city ordinance which allows building to a height twice and a half the breadth of the street. The owners were required by legal process to take down the portion of the building which exceeded ninety feet, and this decision of the Supreme Court makes an end of the various stays which have delayed the execution of that order. In deference to the law and in respect to the beauty of Copley Square, the intruding giant must now abate many feet of his inordinate stature. The important feature of the decision is that it recognizes distinctly the right to pass special building laws for a part of a city. The ostensible reason for the law limiting the height of buildings on Copley Square was to prevent the light from being cut off from the Boston Museum of Fine Arts; but there would be no difficulty in establishing reasons as good whenever a city desired to regulate building on parks and public squares. It may still be true that every land owner may excavate on his own plot until he reaches the centre of the earth, but it is certain that he may build toward the heavens only so far as the general convenience allows. Earlier decisions in the matter of bill-posting and building laws have tended to limit such legislation by the ordinary police power.

It is a mere coincidence, but a happy one, that Mr. Charles F. McKim, the distinguished architect, has received the gold medal of the Royal Institute of British Architects, at the very time when ignorant and unfriendly criticism of his White House improvements was still prevalent at Washington. Those who know the range of Mr. McKim's monumental designs, exemplified by buildings as different as the libraries of Boston and of Columbia University, will feel that the distinction was as justly bestowed as the abuse was indiscriminatingly heaped upon him by wiseacres of the House and Senate. His critics, indeed, have apparently come to a better sense of things in refusing to authorize Representative Cannon's extension to the Capitol, which was to have been executed by the amateur architect now superintendent of that building. That action leads us to hope that the time will soon come when American architecture need not look abroad for the recognition that it should have at home. Washington itself, if the rule of hands off be strictly applied to the various officials who have come into the responsibilities of an architect without the requisite training, will become a means of education to our rulers, and the third American recipient of the Royal Institute's medal (Mr. McKim is the second) may be fortunate enough to please both his notable colleagues of the foreign academies, and at home his more difficult Congressional clients.

There is merit in the proposal advanced by Judge Perry of Connecticut for reciprocity between the States in the levying of inheritance taxes. Laws imposing such taxes are everywhere multiplying, and, as they apply generally to non-resident as well as resident estates, a frequent result is the imposition of a tax by two or more States upon the same property. While it may be true that much of the property thus doubly burdened is paying a belated tribute to an authority whose agents were dodged by the owner during his life, that is no justification for double taxation. To remedy that injustice, Judge Perry would copy the methods of Federal tariff makers. He suggests for Connecticut an inheritance tax for non-resident estates, with a provision for remitting such taxes to States that agree to return the courtesy. It is a novel idea and might apply between Connecticut and Rhode Island, and perhaps Massachusetts. It would be difficult, however, to establish such reciprocity with New York. Because of the gravitation of wealth to this city, the State would lose more than it would gain by such an arrangement. Regardless of the justice of the proposal, it would undoubtedly be loath to surrender any of its highly prized indirect revenue.

Whether Hammurabi was or was not "the friend of Abraham" is a question less important to the world at large than to the Kaiser, who asserted the friendship as a fact, and to Professor Oppert, who speaks for the French discoverers of Hammurabi.Professor Oppert's genial criticism of Imperial chronology is expressed in a tone of learned raillery which will be much more effective than abuse. And, in fact, the various incursions of the Emperor into the arts and 'ologies is a spectacle to encourage the Democritean mood. Perhaps the only serious consideration suggested by the Hammurabi incident is that one may hardly be learned and a king. It is one of the gravest disadvantages of that high office that he who is born to the purple can only with the greatest difficulty see the world in its true colors, while from the first the sources of first-hand information are closed to him. Various mediæval writers have set down an ideal "Discipline for a Prince," but it is probable that few princes were ever so brought up by book. Obviously, no heir to a throne has time for such laborious studies as go to the making of a specialist, and what little learning is open to him is conveyed in diluted forms—*in usum Delphini*. No wonder the Emperor slips when he ventures into the maze of Babylonian history. The error was a venial one, for the point was not the friendship of Hammurabi and Abraham, but the apostolic succession of the Kaiser from both. This must be a matter rather of opinion than of demonstration.

PEOPLE AND REPRESENTATIVES.

Congress is, as we write, drawing to its close in something more than the usual muddle. Party passion, feigned or real, cross-purposes between the two houses, arrogant assertion of power by individual Senators, taking advantage of the way in which the rules of the Senate handcuff it—all combined are threatening the failure of most important legislation. And it is legislation, too, for which there is every evidence of a wide and genuine popular demand. If there is anything that has the people's mandate behind it, it is the interoceanic canal. Yet that project is deliberately strangled. In behalf of the Cuban Treaty, there is not, perhaps, the enthusiasm which existed a year ago—with our customary fickleness, we have got "tired" of that subject; yet we do not doubt that, if put to popular vote, a generous measure of reciprocity with Cuba would carry everything before it.

The clearest case of all is the Philippine Tariff bill. If a plébiscite could be had on the proposal to treat the Filipinos decently—and that is all that is involved in buying their products untaxed—the voices in favor would come up like the sound of many waters. This country is not so mean and starveling as might appear from the action of its representatives in Congress. We do not want to split half-pence with a people in distress. All this pitiful talk about a few thousand tons of Philippine sugar injuring any substantial interest in this, the greatest sugar-consuming nation on earth, would be hooted out of a political campaign if it were ever ventured on the open stump. We are not really built so small as to haggle over fair treatment of a feeble folk who have to look to us alone for aid, after having had the ravages of pestilence and famine added to the desolations of war. If the people could get at the small-minded pettifoggers who are obstructing Philippine tariff relief at Washington, they would brush them aside as impatiently as they would a physician stipulating for his fee before saving a child bleeding to death.

Such being the state of the case, why does Congress sullenly refuse to act? Why does Senator Foraker plead in vain for dealing with the Filipinos as we have done with the Porto Ricans? Why is Senator Lodge compelled to admit that it would be "impossible" to pass a bill giving to the Philippines even so incomplete a remission of tariff duties as the House proposed? Why, finally, are we brought to the shame, as a nation, of seeing the President transmit an urgent message to Congress, containing the explicit and alarming statement of facts by Gov. Taft, only to have the Senate resist the humane appeal and the summons to duty? It certainly seems as if the machinery of government had somehow gone wrong. Every representative in either house of Congress professes to be eager to consult the popular will, yet here is a manifest desire of the whole people which their agents at Washington refuse to execute.

It is obvious that the President's message was really directed more to public opinion than to the Senate, where it was nominally sent. Senators were not ignorant of the emergency. No doubt the President had labored with dozens of them in private on this very subject. The facts were all accessible. The crying need of immediate action was known. Yet the Senate fell back with its helpless *non possumus*, and, as a last resort, the President of the whole people spoke up in their name. The response has been all that could have been expected in the time and under the circumstances. From the press a general protest has gone up. The Senate has been urged to act, and not further disgrace the American name by the display of a paltry spirit towards our own needy wards. Expressions from the pulpit have not been wanting; and everywhere in private one hears only words of disgust and indignation that Congress should so misrepresent the people in this matter of national concern.

Why does it? That question strikes near the heart of many of our political troubles. We say comfortably that the people are represented at Washington; but just how strictly true is that? A critical deadlock like the present shows us, what we often fail to see, that many special interests are well represented at Washington, but that the nation as a whole is but poorly represented. Beet sugar has its Senators, tobacco has its representatives; Standard Oil knows its own at the Capitol; steel manufacturers have their spokesmen there, and so have the makers of gloves and pinchbeck jewelry, as well as the Gloucester herring smugglers—but who is the unfettered Senator that stands, not simply for his own State, or some selfish interest in it, but for the good of the nation at large? What Congressman feels that he is under the eye, not of his own district, or of the men in it who have sent him to Washington for their own ends, but of the American people, and that to them he is answerable?

These questions, with their implied answers, let us far into the secret of the obstinate attitude of Congress when the nation appeals to it. The separate interests which are really represented are all the while alert and active; the people who are ostensibly represented are inattentive and indifferent, for the most part, and have to get very angry and clamorous indeed to be heard at all. This is the essence of the situation in which the President finds himself caught. He has the people behind him; but Congress is controlled by private interests. He marks out a policy of national importance, but finds his measures done to death by the representatives of the parish and the pocketbook.

THE ALDRICH BILL.

The debate on the Aldrich bill for placing the Treasury surplus in the national bank depositories has taken so wide a range and has led to the proposal of so many changes, that a review of the whole subject may be useful to those who have not followed it closely.

The system of keeping the money of the Government in its own vaults dates from the year 1840. Prior to that time the public funds had been deposited in banks and drawn out by checks like that of private individuals and corporations. From 1791 to 1811, and from 1816 to 1833, the deposits had been placed in two banks chartered by Congress; during the alternate periods they had been kept in State banks designated by the Secretary of the Treasury. The abandonment of the deposit system was due to the bank war in President Jackson's Administration. The Jackson party had overthrown the Bank of the United States, and, as the Government had no vaults of its own, it was compelled to use those of the State banks. When the panic of 1837 ensued and these banks suspended, it became necessary either to charter a new Bank of the United States or to provide independent facilities for receiving, storing, and paying out the Government's money. This was the burning question of Van Buren's Administration. The Democratic politicians could not charter a new Bank of the United States without admitting that they had blundered in destroying the old one. So they established the independent Treasury, which, with some slight modifications, has lasted to the present day. Daniel Webster was one of the opponents of that measure. His speech on the Sub-Treasury bill is still read as a rhetorical masterpiece, in which a dry and forbidding question in public finance has been invested with the charms of his oratory:

> "Money," he said, "is designed to circulate, not to be hoarded. All that Government should have to do with it is to receive it to-day, that it may pay it away to-morrow. It should not receive it before it needs it; and it should part with it as soon as it owes it. To keep it—that is, to detain it, to hold it back from general use, to hoard it—is a conception belonging to barbarous times and barbarous governments."

These words are as true now as when they were spoken, and are even better appreciated now than then. They contain the whole philosophy of the Aldrich bill, which seeks to accomplish the main part of what Webster contended for. The only differences are due to changes of time and circumstances. Nobody now proposes a new Bank of the United States, but nearly everybody agrees that it is absurd, harmful, and even dangerous to treat the Government's collec-

tions of revenue as a miser's hoard, depleting the money market and depriving the community of some part of its means of transacting business. Upon this subject there is no difference of opinion except as to matters of detail.

The rigid provisions of the Sub-Treasury law were relaxed in 1864 so that the Treasury might deposit that part of its surplus funds which was derived from internal revenue (not customs duties) in national banks upon receiving from such banks United States bonds as collateral security. The reason for making a distinction between internal and customs revenue was that the latter was payable in gold and the former in currency. Although this distinction ceased to have any significance when specie payments were resumed in 1879, it has remained on the statute-book. The Aldrich bill rightly proposes to abolish it. It proposes also to modify the clause requiring from the banks United States bonds as security for such deposits, by accepting other collaterals, such as the bonds of States, cities, and corporations of a specified grade, and requiring interest for the deposits at not less than 1½ per cent. per annum. The question whether collaterals might not be dispensed with altogether and a higher rate of interest obtained, has not been considered in the Senate, but has been brought up by the Banking Committee of the House, which favors the latter plan. This would save time, labor, and the cost of transportation of the securities, besides bringing a larger return to the Treasury. As the Government has a prior lien on all the assets of national banks for dues to itself, it would be impossible for a loss to occur if the Secretary of the Treasury were a man of even moderate business sagacity.

At this juncture the bankers of Chicago have sent to Washington a protest against the exaction of any interest on Government deposits. They say that if the Aldrich bill passes in its present shape, the result will be the immediate surrender by the banks of the deposits they now hold, and a consequent contraction of bank notes. The reason why this result would follow, they say, is that the banks cannot afford to carry as investments either Government bonds or the other bonds that the Aldrich bill provides for. They add that if they were required to put up Government bonds as security and pay 1½ per cent. interest for the deposits, they would lose money. This may be true, but it does not follow that there would be a loss on the other bonds named in the bill. If money is not worth 1½ per cent. in the West, under the terms of the Aldrich bill as a whole, the stringency cannot be great. It would be just as well to let the deposits flow back to the Treasury. We venture to predict that New York will take all that Chicago surrenders on those terms.

It is, nevertheless, true that the bill would lead to the selling of Government bonds and the buying of the other kinds to a pretty large amount. The price of the former would be depressed, and that of the latter augmented, but the demand for Governments is so steady and the supply so limited that this effect would be slight and only temporary. The amount of Treasury deposits in the banks now is $130,000,000 but no such amount of Government bonds could be thrown on the market by the shifting process, since every bank must hold a fixed amount of bonds under its charter requirements. The shifting process would be slow in any event.

Mr. Fowler has presented a statement to the House showing that the money in the Treasury, over and above the customary working balance of $50,000,000 and the amount already deposited in the banks, is less than $22,000,000. As we are facing a probable payment of $50,000,000 on account of the Panama Canal, there is not much danger of a contraction of the money supply, even if the bill does not pass now. What may happen during the next nine months cannot be foreseen. People have their eyes on the demand for the next crop-moving season rather than upon any present exigency. Of course, there ought not to be any Treasury surplus to dispose of; of course, the taxes ought to be cut down to the measure of the necessary expenditures. But tax reduction requires time, even when Congress is ready to take it up for practical legislation. Such is not the case now, and meanwhile the surplus may accumulate to an aggravating extent.

THE OBVERSE OF PROSPERITY.

Universal prosperity is, in some respects, like universal protection. If all are efficiently protected, nobody is protected. No one industry, that is to say, then has a tariff aid which gives it a competitive advantage. And if everybody's wages, salary, rents, freights, prices, go up equally, and their necessary expenses in the same proportion, no one is, relatively and in so far, better off than when all were equal lower down on the scale. There are, of course, other considerations, such as steadiness as well as remunerativeness of employment, which enter into the question; but in so far as prosperity consists merely in advancing income all around, with outgo increased in like proportion, the more widely and even-handedly its blessings are diffused, the more dubious do those blessings appear to be. Is it not the fact to-day that, with all classes benefiting and, as far as they are able to, benefiting equally by the continued good times, the times themselves begin to look less good? With every form of labor and manufacture and enterprise at the top notch, men look ruefully at each other, wondering who is going to fall first, and how far.

This is one form of the prevailing suspicion that prosperity is not all that it is cracked up to be. We handle more money, but we have no more to the good. Enlarged outlay eats up increased earnings. Corporations feel this as well as the individual; and we know of large building concerns, and even railway companies, whose presidents say that they hope prices and wages will break soon. One reason they do is because they perceive the risk of capitalizing their present undertakings at so high a level as the present. Building in this city, for example, costs to-day, we think it safe to say, considering the rise in wages and the higher price of materials, 20 per cent. more than in 1895. But that means that when we return to something like the conditions of eight years ago—as we shall do unless history is going to cease to copy fair its past—real-estate owners will have to take 20 per cent. less rent than they obtain to-day. If they do not, new buildings with cheaper capital and labor and materials will drive them out of the market. It is a clear view of this possibility which makes far-sighted and clear-headed men a little nervous to-day about investing more money at so high a level of capitalization that future sacrifices are certain to be necessary. They would prefer a gradual sinking to a further mounting only to fall the harder. "Well, the break can't come too soon to suit me," is the sentiment one hears expressed in a surprising number of unexpected quarters.

This thing has wider bearings. It touches the entire industrial situation of the United States. President James J. Hill shrewdly stated an apparent paradox, the other day, when he said that our very prosperity was our present chief peril, from the point of view of international trade. The foreign markets which we conquered in the desperation of our recent adversity, we are letting slip from our fingers in the complacency of our existing prosperity. The point is driven home by the Chief of the Bureau of Foreign Commerce, in his recent annual review. High prices and profits at home have made our great manufacturers neglect the foreign trade, comparatively. Domestic demand has been so enormous that everything else has been forgotten. Such vast sums as Jones & Laughlin at Pittsburgh, for example, are spending on their steel plant, are intended primarily to catch up with the home trade. Similar outlay and improvements and extensions elsewhere are certain to result in an immensely expanded production in the near future, which will not only overtake, but outstrip, the needs of the home market. It is that impending glut, along with the choked outlet abroad, in connection with which President Hill expresses a prescient fear.

Ah, but when the domestic glut comes,

we shall cheerfully resume our invasion of foreign markets. We shall again "dump" our surplus goods upon the doomed Europeans. But the process may not be so easy the second time. This is the truth which Chief Emory enforces. Europe has not been asleep, meanwhile. She does not intend to fall helpless before the "American peril" the next time. While we have been revelling in our wonderful home market, European manfacturers have been fortifying themselves against our next attack. They are bringing their plants up to date. They have taken of the best of our labor-saving and electrical machinery, and are now preparing to beat us with our own weapons. Not even our boasted tariff weapons are they neglecting to furbish up for their own use, as any one will be convinced who looks carefully at the recent tariff legislation of Germany and Austria and Russia. Those countries are confident that they will be in an impregnable position when our next frontal attack is made. In time of depression they feared us; but now that we have waxed fat on prosperity, they snap their fingers at us. These are some of the considerations which cause President Hill to dread lest a glut at home, falling in with a congested outlet abroad, may shake our industrial prosperity to its base.

To these aspects of the seamy side of prosperity, the moralist, as distinguished from the financier and the politician, could certainly add many more. The lavish habit of flush times; the lax standards for which wealth is made the sufficient apology; the premium put upon the gambling spirit; the substitution of debonair recklessness for prudence; the strengthened tendency to lean upon the Government and to curse every Administration as imbecile which does not guarantee a chicken in the pot—all these and the other moral obverses of prosperity might well be commended to the thoughtful. We may yet come, with Calhoun, to thank God for hard times as the necessary corrector of evil customs and the salutary nurse of the more rugged civic virtues.

THE NEGRO AND THE TRADE UNIONS.

The seventh number of the Atlanta University publications has just been issued under the title of 'The Negro Artisan,' edited by W. E. B. Du Bois. Of its 192 pages, 23 relate to the trade unions and negro labor. That this was a coming question, and one not easy of solution, was perceived long ago; but it was generally supposed that the economic importance and growing competition of the negro in handicrafts would open for him the door to the unions, and that the color line would gradually disappear. It is, therefore, a surprise to learn from Mr. Du Bois's investigations that the record of the American Federation of Labor toward black mechanics has been one of retrogression, and that the color line has been deepening there in recent years despite the efforts of its President, Samuel Gompers.

At the close of the civil war a wave of sympathy for the freedmen swept over the North. It affected the wage earners equally with other classes of society. In 1866 the National Labor Union officially called upon all workers "of whatever nationality, creed, or color, skilled or unskilled, . . . to join hands to the end that poverty and all its attendant evils shall be abolished." This declaration was followed by a similar one from the National Labor Congress of the following year. The next deliverance on this subject came from the Knights of Labor at their national convention in 1876, whose creed recognized no distinction of "race, creed, or color." Notwithstanding this liberal and rotund sentiment, very few Northern negroes gained admittance to trade unions, since the proceedings of the Knights were secret, and three blackballs sufficed to exclude from membership in any local Assembly. In the South, where negro artisans were more numerous, they were able to organize unions of their own, but at the annual convention held at Richmond in 1886 District Assembly 49, from New York, brought a negro delegate who proved to be the innocent source of so much trouble in hotels and theatres and on the floor of the convention that the Grand Master Workman, Mr. Powderly, had to call upon the chief of police for protection. He also made a very stirring appeal in the columns of the Richmond *Dispatch* for the rights of the black man, but the only practical response that he received was a letter from a Richmond lady offering him (Powderly) the position of coachman in place of a black one who had left her, "because," she said, "you are so much in sympathy with the negro."

The decline of interest in the negro as a trade unionist dates from this year, 1886. The Knights of Labor also began to "decline and fall off," the same year, and the American Federation of Labor began to supplant them as a national organization. President Gompers early took the position that no union affiliated with the Federation had a right to debar negroes from membership. He was not able, however, to secure obedience to this rule. It was found to be necessary in the South to have unions for whites and blacks separate from each other in most cases. Then a difficulty arose in the central bodies chartered by the Federation, which refused to receive delegates from local unions of negroes. The National Federation was unable to insist that they be received, because such insistence would have caused disruption of the central bodies. All that President Gompers could accomplish was to secure charters for central labor unions and Federal labor unions composed wholly of colored men. This was accomplished at the convention at New Orleans last November. Two additional rules of a retrograde nature are mentioned by Mr. Du Bois, but they appear to have come in force by tacit agreement, rather than by open vote. One is that a union which expressly excludes negroes by Constitutional provision may affiliate with the American Federation of Labor. The railway trackmen, telegraphers, and others are cited as being in this category. The other is that a union already affiliated with the Federation may amend its laws so as to exclude negroes. This was done by the stationary engineers at their Boston convention in 1902. As the Federation took no action in these cases, its assent is presumed.

Nevertheless, there are some unions of a national or international character which have a considerable negro membership. The largest of these is the United Mine Workers, with a black membership of 20,000 in a total of 224,000; the tobacco workers, black 1,500; the barbers, black 800; the carpenters, black 1,000. Of course, there are many more blacks in the trades named who are non-unionists, or are not affiliated with unions recognized as regular by the Federation of Labor. The Journeymen Barbers' International Union has a difficulty in Little Rock, Ark. There is a white union and a colored one there. The white union will not meet the colored one, but insists that the latter shall obey the rules established by the former. The colored union declares that it was first in the field and refuses to be "bossed." The trouble is still unsettled, and it is not the only one of its kind, nor is it confined to the South. A similar case is reported in Pennsylvania, where a local white secretary says: "We have to recognize them to hold our prices and short hours, but we find it very hard to get along with them."

It is a noticeable fact that the line of greater or less exclusion of negroes runs parallel with the greater or less degree of skill required in the respective trades. Thus, there are very few negroes found among the carpenters and joiners. In the South they have separate unions. In the great cities of the North, it is almost impossible for a negro to be admitted to the local unions, and there is no appeal from their decision. Among the teamsters, however, there are many negroes, and there is no difficulty in gaining admission, while the Hod Carriers' Union has a majority of negro members; and, as we have seen, the negro membership among the United Mine Workers and the Journeymen Barbers is large. The Longshoremen have no objection to negro members. The masons and bricklayers also have a large

colored membership in the South, and often in mixed unions. In the North, however, where there are very few colored men qualified, it is very difficult for them to gain admission. In Washington city they are not admitted at all.

If any generalization is to be drawn from the facts collected by Mr. Du Bois, it is that the trade unions will in the long run be governed by their pecuniary interests. At the outset they share the feeling of race prejudice which so largely prevails, both North and South, but they will not allow this feeling to shipwreck the greater aims of unionism. An official of the Broommakers' Union writes:

> "I am informed that some organizations refuse membership to the negro. I consider it a serious mistake, as white labor cannot expect the negro to refrain from taking better places unless we will assist him in bettering his condition."

In this sentence, probably, we find the reason why the unskilled or half-skilled trades are more open to "negro equality" than any other. The less skill required, the greater the number of possible competitors, and the greater the inducement to take the negro into partnership as a worker. When the colored men come in single files they are excluded, but when they come in battalions they are admitted to the unions. And so it must be, unless the race question is to end in bloodshed among the wage-workers themselves. The negro is making progress as an artisan. The employers have no objection to him as a worker, but rather welcome him. Therefore, his competition will be a progressive factor in the industrial world, and the question is, whether his competition shall be controlled as far as possible under union rules, or whether it shall come in conflict with unionism and take sides with the employer. When this issue becomes a serious one, it is hardly doubtful that race prejudice will yield to pecuniary interest.

A YEAR OF THE CARNEGIE INSTITUTION.

To thoughtful Americans the most interesting of recent publications will be neither the latest story of marital infelicities nor the newest historical novel, but the first "Year-Book" of the Carnegie Institution of Washington. Mr. Carnegie's trustees make so complete a report that it is possible to study the actual condition and the prospects of this unique organization for research. Conservative management is plainly in evidence. The recommendations for appropriations from the annual income of $500,000 are made by eighteen small advisory committees composed of distinguished exponents of the various sciences. These committees all seem impressed with the inadvisability of duplicating the work of existing institutions, or of allowing the Carnegie fund to become an alms for causes which are able to provide for themselves. This refreshing sanity of view appears in the first declaration of the committee on geology, which is of the opinion "that research in geology is fairly well provided for by existing agencies."

Perhaps the most striking advantages of this method of coöperative investigation are illustrated in the plan of the Committee of Proposed Explorations and Investigations, for "a Biological Survey of that portion of the Old World lying north of the tropics, and technically known as the Palæarctic region." This investigation is to coördinate the mass of observations in natural history since Aristotle, treat the vexed question of the relationship between life of Northern America and Northern Europe and Asia; solve the large problem of former glacial deposits and their influence on the present distribution of life; and consider the whole matter of the historic expansion of fauna, besides many topics of more limited interest. All this is work with which no other institution is fully fitted to cope; and in a day when science tends to lose itself in mere heaping up of minute inquiries, such a plan for generalization is peculiarly inspiring.

The most ambitious programme is that of physics for a fully manned laboratory at Washington, an annual grant of $150,000 to spend at that centre, and of $100,000 to distribute to institutions and investigators throughout the country. Only an expert can judge of the propriety of such aspirations. To a layman the request for the permanent appropriation of one-half the entire income to a single science, even though it be the broadest of all, seems of a boreal coolness. With a modesty dictated by the historic view, the palæontologists seek only a journal and a few fellowships; but those who deal chiefly with fossils necessarily lack something of modern financial initiative. Similarly, the geologists ask for fellowships, and emphasize the coöperative nature of the institution by offering to lend instruments to properly accredited exploring parties. These gentlemen also exemplify a shrewdness usually denied to specialists in refusing to set subjects for research, preferring that candidates for fellowships should show their worthiness by themselves suggesting promising lines of investigation. The botanists, even if they get their "desert botanical laboratory," will hardly succeed in making the desert blossom like the rose, but they will throw new light on a kind of plant life now insufficiently understood. To complete this hurried survey, the Committee on Anthropology points out the researches into the language, religions, and customs of certain Indian tribes which must be promptly made, if at all. The phonograph—for songs and ritual—plays an interesting part in the recommendations. Those who have taken their idea of Indian religion from 'Hiawatha' will be shocked to learn that "all the [Indian] rituals are regarded as personal property, and may not be transferred except on payment of goods or money." Clearly, Mr. Carnegie's trustees must not shrink from subornation of piety.

Within the fields represented by the eighteen committees, this year-book presented by President Gilman and his associates gives abundant evidence of original and discriminating activity. But to many the largeness and evident promise of the Carnegie Institution will not disguise a certain one-sidedness. Among eighteen advisory committees, chiefly drawn from professors of the technical sciences, the single representative of the historical or humane studies is the Committee on History, unless, indeed, anthropology and psychology be included among the humanities. In the past year $185,000 was appropriated to various branches of research; of this, history got $5,000. There is an obvious disproportion here. The Carnegie Institution cannot afford to assume that the study of man's achievements in art, literature, and statecraft should occupy a position wholly subordinate to the investigation of the physical phenomena of the world. May it not be that such an institution as the American School at Athens, which, in its recent excavations of the Argive Heræum, has given us a glimpse of an artistic period hitherto unknown, and has rescued noble marbles for the pleasure of the world—may not such an institution be as worthy of assistance as a laboratory which studies the microscopic forms in sea water?

The chemists of the Institute have recommended that investigators in their subject be supplied with assistants. Would not a similar principle suggest that the numerous museums of America, which have valuable collections but funds quite insufficient to supply skilled curators, should be given the very little money that would make their resources available? Here is a field ready for the Carnegie Institution, and a field in which a very little money would produce very fruitful results. There are not a few museums where one or two supplementary salaries of $1,000 or $1,500 would double the efficiency of the staff. It may be that literary, philological, and artistic investigation is already "fairly provided for by existing agencies," but the representatives of these subjects should at least have an opportunity to join in this self-denying ordinance of the geologists. Until representatives of the humane arts and sciences have a hearing in the Carnegie Institution, its organization must be regarded as incomplete.

THE SACREDNESS OF THE TREE.

Tree-planting associations and Arbor Days are good things. It is well that

the brutally commercial spirit which considers a tree as merely so much lumber should be checked, and that the love for trees as things of beauty should be cultivated. But there are always two possible extremes between which lies the truth, and now and then one sees signs of a sentimental and almost superstitious reverence for the tree, as such, which is even absurd. It may not be an especially fine tree; it may obviously be in the wrong place; it may have grown of itself or it may have been unintelligently planted; but, once in existence, it is to be religiously respected, and to cut it down or even to move it becomes a kind of crime. It may so shade a house as to render it unhealthy for the indwellers, it may mask a beautiful prospect or disorganize a landscape composition; but it is vandalism to touch it. Let a man so much as propose to lop away the lower branches of a pine-grove, thereby opening up a noble view of mountain between the pillared trunks, and making of the needle-strewn floor a perfect playground, and he is met by the shocked protests of the very neighbors who will, a little later, learn to appreciate the far higher beauty which he has created out of mere natural wildness. Cannot we learn that the axe, too, is a good tool in the hands of an artist, and that even a beautiful tree may be, as *dirt* has been defined, "matter in the wrong place," and to be got rid of?

We have lately had a striking instance of the possible inconvenience of this survival of primitive tree-worship in the discussion of a site for Saint-Gaudens's wonderful equestrian group of Gen. Sherman. Three sites were proposed for it. In the order of preference of the artist and his architect these are: first, on Riverside Drive, before Grant's Tomb; second, the round-point at the southern end of the Mall in Central Park; third, the site, finally selected, in the Plaza at Fifth Avenue and Fifty-ninth Street. The selection of the first of these sites seems to have been prevented by jealousies with which we have, at present, no concern; but the Park Commissioners refused the second, for reasons which it may be worth while to discuss.

It might be argued, with some plausibility, that the Sherman group is not of the kind of sculpture best suited for the ornamentation of a public park, that park sculpture should be rather decorative than monumental, and that, above all, it should not be military. This, however, is a counsel of perfection. Sculpture of the purely ideal and decorative kind we do not possess, and, at present, do not seem likely to possess, and we must make the best use possible, for decorative purposes, of such memorial sculpture as people are willing to pay for. The Sherman group is superbly decorative, apart from its subject, and would richly ornament any place in which it might be put, while it would be seen to the best advantage in such a site as that proposed.

At the round-point there are four well-grown and handsome elms which it might be necessary to remove to make room for the statue and its pedestal, and this sacrifice the Commissioners were unwilling to make. They seem, also, to have thought that the statue would interfere with the effect of the Mall as a piece of landscape architecture by closing the southern end of the vista. Now there is much good designing in Central Park, but the approach to the Mall is not an example of it. The splendid double avenue which terminates magnificently, at its northern end, in the Terrace, is suddenly narrowed at the south by these four trees, and seems to leak away into the general surroundings and lead to nothing. What is distinctly wanted is just what the Sherman group would have supplied—an object of importance from and to which the vista should lead, yet an object relatively small enough not to obstruct the view. Even were no such work of art available to mark the axis of the walk, it would still be an improvement to do away with the four trees; but they are there, and the sacredness of the tree forbids that the mistake of their planting should ever be corrected.

Whatever may be the fitness or unfitness of an equestrian monument for the ornamentation of a park, no one can deny that such a monument is an appropriate ornament for an open space in a city such as is the Plaza, and to the Plaza the Sherman is to go. It is an honorable site—though the great height of the buildings which partially surround it is somewhat of a drawback; a site which might satisfy any artist were it properly prepared for the statue. Ah, but there are the trees! There are trees in the Plaza, and they must not be sacrificed. It is true that the statue will never be properly seen—but what of that? It is true that the man who should propose to plant trees in rows either side the Colleoni at Venice would be thought a lunatic—but the trees are here, and the statue shall be set between them because it is inconceivable that they should be disturbed. It is true that these are not particularly fine trees, and that far finer ones could be grown in fifty years. It is true that the Sherman group is not merely a work of art, but such a splendid and consummate work of art as has not, perhaps, been produced in four hundred years. What then? The Tree is sacred and must not be touched. The statue may suffer—the whole effect of the square may suffer—but the tree, like the American flag, must never come down.

Not that it would be necessary to use the axe. To move trees of almost any size, and to replant them safely, is, today, as has often been proved, a mere matter of expense. Money will do it, and when the city is offered a monument to one of the greatest of soldiers, which is also the masterpiece of a great sculptor, it might surely spend the money necessary to clear for it a proper site so that it may be seen and appreciated. The Plaza is not a breathing-space in a congested district where a bit of green to rest the eyes may, conceivably, be more important than any statue. It is at the very entrance of the Park, to which it would make the better contrast and preparation if it were itself bare of trees. The statue which is to be erected is so important that all else in the square will properly be its setting, and the setting ought to be appropriate to the jewel and to show it off to the best advantage. The sculptor and his architect, Mr. McKim, are both members of the commission which has been preparing plans for the beautification of Washington, and no better men could be chosen if such a commission were to be appointed for New York. Common sense would seem to point out that they, with, perhaps, one other eminent artist—architect or landscape gardener—should be invited to draw plans for such alterations in the planting and arrangement of the Plaza as would make it a fitting frame for the noble work of art which it is to contain. Alas! we seldom do the sensible thing, and it is to be feared that tree-worship will be allowed to prevent our taking advantage of a golden opportunity.

MIDWINTER LOAFING IN JAMAICA.—I.

MANDEVILLE, January 31, 1903.

It was no longer ago than Wednesday of last week that I was making my way from Cambridge to Long Wharf in Boston, over streets and walks covered with glare ice on which a heavy rain was pouring; and yet I have already been almost a week in the tropics. It is my happy lot to live among people who may fairly be called strenuous; and, whether it be that strenuousness is contagious, or temperamental, or that low temperatures and high-strung nerves go together, certain it is that high temperatures relax nerve-tension and are a better antidote for brain-fag than the venders of "Moxie" might like to have us believe. A friend whose good judgment I trust, suggested a brief trip to Jamaica; and, feeling the need of a break more than I like to admit, I followed his suggestion without ado. Kingston, although little over five degrees west of Boston, is almost twenty-five degrees south—that is, not very far from a third of the distance from pole to equator; and the voyage, accordingly, takes you through a considerable part of the gamut of ordinary climatic changes, and necessitates a corresponding variety of clothing, perhaps an ulster or a wind-proof Swedish leather jacket for the first day or two, and the lightest Bombay coat for the last days and for use on the island itself.

The voyage out, on the steamer *Admiral Farragut* of the United Fruit Company, was so strictly according to schedule as to be quite devoid of noteworthy incident,

First you have the more or less boisterous North Atlantic, and deserted dining-tables; then, at 35 degrees North, or thereabouts, smoother seas and milder breezes bring out the convalescents to their steamer-chairs; and anon glum silence gives place to song, as does the blackness of the northern water to the true sapphire blue of the tropics. At the same time, it may be noted, fasting gives place to excessive and extremely unintelligent eating. Compared to the tracks of the Liverpool liners, this is a lonely part of the ocean. We saw few ships; but passed, within easy hailing distance, the *Dewey*, which alternates with her sister ship the *Farragut* in the weekly sailings from Boston to Jamaica. By day there was little to see over the rail save the flying fish and the frequent patches of Sargasso weed. The color of the seaweed is a rich yellowish brown, and is very beautiful on the blue, though whether by reason of contrast or of harmony I cannot say. But at night, of course, there was the change in the face of the heavens that could not fail to interest star-gazers; and it may be well, in passing, to remind the traveller that nearly all of the celestial sphere may here be seen within twelve hours by observing the aspect presented just after the very brief evening twilight, and again that presented just before dawn. Most generally striking is doubtless the nearness of the North Star to the horizon. To my mind, Orion rather loses than gains in impressiveness by its greater altitude when crossing the meridian; while, on the other hand, the Scorpion, always tantalizingly low for Bostonians, can here be seen complete, even to the extremity of the magnificent "tail," and thus gains so much as to outrival in splendor the (to us) unfamiliar but much-vaunted Southern Cross.

On Sunday morning the Bahamas were in sight, and in the late afternoon we passed the eastern end of Cuba, Cape Maysi, so close as to distinguish the palms, and with daylight enough to see the verdure-clad mountains, rising from our point of view somewhat in the manner of terraces, each more distant ridge higher and higher, the often sharply serrated outlines of the loftiest being picturesquely thrown upon the background of the evening sky.

One night more of the unremitting twin-screws, and we sight the lighthouse of Port Antonio, which is our outward journey's end. Port Antonio is the principal port of the island after that of the capital, Kingston, and is some six or eight miles west of what we may call the northeast corner of the island, and lies at the head of a broad bay divided into two harbors by a lofty peninsula, and sheltered from the north by a smaller island. The west harbor is the one commonly used, and was entered by us, with the slowness of extreme caution, through a narrow channel between the small island and the peninsula. We were made fast at a little before seven on Monday morning, and the captain took out his watch and remarked facetiously that we were three minutes ahead of time. The run was about sixteen hundred miles, and was made in a few hours less than five days—quite fast enough for those who left home expressly to "go slow."

The Hotel Titchfield, conducted by the United Fruit Company, is situated on the summit of the peninsula just mentioned, and so gets the full benefit of every breeze that blows. And that is saying much; for, although we are a little nearer the equator than is Bombay, the climates of the two places are as different as two varieties of tropical climate well can be. By day there is the sea breeze (they call it "the Doctor"), and by night there is the breeze from the mountains; and between them one need not suffer from the heat. We Hyperboreans must, of course, avoid overexertion in the sun—say, between half-past ten and half-past three; but the danger of sunstroke, which is so considerable in India, seems to be nothing here.

The temperature at the coast is wonderfully equable, the largest monthly range at Kingston between June, 1880, and May, 1890, having been from 86.4° F. to 66.8°, or less than 20 degrees, and the mean range being only 17.1. On the other hand, great diversity of climatic conditions may be had by seeking the various altitudes of this extremely mountainous island. Its area is some forty-two hundred square miles, of which more than one-eighth lies at an elevation of over two thousand feet, and about a third at a level of between one and two thousand. Here at Mandeville the altitude is twenty-one hundred or more, and the place is much frequented as a sanatorium. One of my table companions is a Bostonian who, only a few minutes before the *Farragut's* sailing time, was taken to the steamer from his bed, where he had been suffering from the graver sequels of pneumonia; and in his case the mildness and dryness of the air have approved their salubrity to a striking degree. Further attractions of Jamaica for the afflicted in body are the mineral springs; these abound, but the two most noted are the Bath of St. Thomas-the-Apostle (hot sulphur springs, with a temperature of about 126° F.) and the Milk River Bath. Ample details about these and other matters that concern the island as a health resort are given in a recently published volume entitled, 'Jamaica, the New Riviera,' by James Johnston, M.D. The work is fully and well illustrated, and is serviceable as a general compend for visitors, and may be had by sending a postal order for three shillings to the author, whose address is Brown's Town, Jamaica.

For pleasurers the chief resources are walking, riding, driving, cycling, fishing, and swimming. I lost no chance for the unwonted experience of a dip in the sea in January; the bathing in ocean water at a temperature of 70° or more and the early morning walks appealing strongly to my taste. The macadam roads, barring the steepness of the hills in the mountainous districts, are exceptionally good, and fit for the bicycle, and, of course, also for recreation in the carriage (for which the usual word is "buggy") or in the saddle. There are good golf links here and at Kingston, and tennis clubs everywhere; and the Jamaican waters ought to be uncommonly attractive to yachtsmen. For cruises hereabouts, Kingston, with its excellent harbor, convenient supplies, and hospitable Royal Yacht Club, is a good starting point.

The journey hither by rail from Port Antonio takes us first westward along the coast, then southward across the mountains to Spanish Town, and finally westward and northwestward for about half the length of the main line that runs from Kingston in the southeast to Montego Bay in the northwest. At first we have many charming glimpses of the ocean; and one may see occasional "Tam O'Shanters," rocks rising for some feet above the level of the water, which has eroded the subjacent limestone in such wise as to leave a curious turban-shaped mass resting upon a slender neck-like support. The result is decidedly picturesque. Tons of once good but unmarketed cocoanuts lie rotting in great heaps, and a planter who travels with us charges the railways with unfair discrimination. For a large part of the line across the mountains, the gradients are as steep as 1 in 30, and the prospects from the heights are wide and fair.

Most of us tourists are in compartments of the third class; and there one may learn how to eat an orange without any other implement than a sharp jack-knife, and yet with entire gustatory satisfaction and neatness withal. A charming young woman once told me that the only way to eat an orange was to lock yourself in your room and eat it; and who might dare to guess how many myriads of oranges have been most unwillingly and yet resolutely declined at the tables of generous entertainers, by guests whose only reason for refusal was sheer dread of the possible embarrassments incident to their deglutition? But, with the confidence born of use, the Jamaican goes boldly to work. He pares the orange as you would an apple, in spiral zones, taking care to cut off all of the colored surface of the peel which contains the disagreeably pungent oil, and leaving everywhere enough of the white and tasteless inner portion of the peel to cover the pulp completely. This white peel serves as a kind of edible napkin, and, after you have sliced off a small segment of the sphere near and around the pole, it serves also as a juice-proof cup. Holding it right side up, you may bite into the cup without awkwardness, and enjoy its luscious contents without loss. If we could only have the fruit, as I did, half-a-dozen for a "quattie" (three cents), all tied by their stems into a bunch, and garnished with a dainty sprig of orange leaves, this knowledge might really be worth the knowing. C. R. LANMAN.

THE CHOISEULS.

PARIS, February 11, 1903.

The second volume published by M. Gaston Maugras on the Duke and Duchess de Choiseul is much superior in interest to the first, as it deals with phases of their life of a more private character, and contains more inedited documents. After having been for many years the real master of the destinies of France, Choiseul fell from power, purely in consequence of his proud attitude towards Madame du Barry, the mistress of Louis XV., who succeeded Madame de Pompadour. Choiseul had always found an ally in Madame de Pompadour, who was a very intelligent person, but he could not be reconciled to Madame du Barry, whose origin was of the lowest, and whom he considered a real adventuress. On the 24th of December, 1770, Choiseul received by the hands of M. de la Vrillière the following letter:

"I order my cousin, the Duke de Choiseul,

to place the resignation of his charge of Secretary of State and of Superintendent of the Post-office in the hands of the Duke de la Vrillière, and to retire to Chanteloup till further orders on my part.—LOUIS."

The Duke was taking his after-dinner nap when this letter reached him. He read it, went to sleep again, and, as soon as he woke, ordered his carriage to be in readiness for Chanteloup, his country-house. He had served the King for twelve years; he was never to see him again, and did not ask for a parting interview. He contented himself with writing to Louis XV. a dignified and proud account of his long administration.

The public understood at once that Choiseul had been sacrificed to the new favorite, and the emotion in Paris was intense. Choiseul's hôtel was literally besieged by the numerous friends who rushed to bid adieu to the great Minister. His departure took the proportions of a triumph; the streets were lined with people, and when the Duke and Duchess left for the Barrière d'Enfer, alone in their coach, with only Gatti, their doctor, they were accompanied all through Paris by popular acclamations. Madame de Gramont, the sister of Choiseul, was the first to rejoin him, with Lauzun, his nephew. Soon after, the exiles were joined by their intimate friend the Abbé Barthélemy and by some of their relations.

The Duchess of Choiseul left in Paris her intimate friend Madame du Deffand, her letters to whom record all the details of the life led by the exiles at Chanteloup:

"I am happy," wrote Madame de Choiseul, "and what more can I say? . . . We have very tranquil nights, and we spend all the morning in adorning ourselves with pearls and diamonds, like princesses in a novel. I have never been so well *coiffée* and so occupied with my dress as here. . . . I want to become young again, and, if possible, pretty. I will try at least to persuade Grandpapa [the name familiarly given to the Duke de Choiseul by Madame du Deffand, who called the Duchess herself ironically Grandmamma] that I am both; and as he has few objects of comparison, he will be easily taken in."

Life was very full at Chanteloup with writing, reading, amusements, and occupations of all sorts. Numerous visitors came in turn, and it soon became the fashion to make a visit to Chanteloup. The King's permission had to be asked, but after some time it could be obtained more easily than at first. Madame de Choiseul was very anxious to have a visit from Madame du Deffand, but could not induce her to leave Paris. "I must represent to you, dear Grandmamma," wrote Madame du Deffand, "that I am seventy-four years old, that I have to be escorted. You know all that, it is true; but what you do not know, perhaps, is that my head gets weaker. No memory, no possibility of any application, no understanding, no gaiety, no imagination. . . . Such is the state of your grandchild." Madame de Choiseul replies to her old friend:

"You always tell me the same thing, my dear grandchild, so I will always answer the same thing. You think that I love you out of complaisance, and that I wish to see you because I am polite. No, no! I love you because I love you. . . . I wish to see you because, rightly or wrongly, I love you. . . . If your head gets weaker, it will be more like mine, for I never had any. . . . If you are seventy-four years old, it is just the reason why you should live in a château, where you will find, as it suits you, either company or solitude."

I cite only a few lines of this charming letter from a most charming and excellent person; and truly it is but a sample of all her letters. The new volume of M. Maugras may be said to be a triumph for the memory of this admirable person, a model of all the virtues in the lightest society and the most frivolous time.

The château of Chanteloup deserves a description. It is situated in a beautiful country, overlooking the valley of the Loire. It was originally composed of a great central house with two pavilions at the extremities, from which ran two fine galleries with arcades ending also in pavilions. Choiseul, during his long exile, added two aisles, and thus formed a large court of honor. M. Maugras gives the most minute details regarding the inner apartments and their furniture, which was composed exclusively of those charming specimens of the art of the 18th century which are now bought at extravagant prices by collectors. There were some remarkable pictures on the walls, by Bassano, Canaletto, Boucher, etc. One of Boucher's pictures, "Apollo Pursuing a Shepherdess," was painted in 1730 at the time of Choiseul's marriage. The Duke was represented as Apollo, the Duchess as the shepherdess. There were several views of Rome, painted when the Duke was Ambassador in the Holy City.

Chanteloup, I repeat, became a sort of Mecca. "It was," says Horace Walpole, "a new spectacle for France to see a fallen minister remain an object of veneration and of love; it was a new thing also to see the King becoming unpopular, or, what is synonymous in this country, out of fashion. Louis XV. was becoming almost isolated at Versailles; there was always a crowd at Villers-Cotterets, the country house of the Duke d'Orléans, at Chantilly, the country-place of the Condés, and at Chanteloup. Chancellor Maupeou, who had dissolved the Parlement of Paris and made, by a sort of *coup d'état*, a new Parlement (which the people called the Parlement Maupeou), was dissatisfied with the leniency of Louis XV. in allowing everybody to pay a visit to Chanteloup. "At my age," said Louis XV. to the Duke d'Aiguillon, "people only want rest."

Maupeon advised Madame du Barry to buy the magnificent portrait of Charles I., by Van Dyck. She sold it afterwards to the King, and had it placed in the gallery through which Louis XV. went every morning to mass, so that he should meditate on the results of weakness. When Choiseul had to leave the Cabinet, he retained his office, which was very important in a pecuniary point of view, of Colonel-Général des Suisses (it stood him in 100,000 livres a year). After some time he was notified that this office had been taken away from him. The King's orders were transmitted to him one evening, when he was sitting quietly in the salon of Chanteloup, with the usual company. By way of compensation the King gave the Duke 110,000 francs in pensions. The post of Colonel-Général was given to the Count d'Artois. The Duke had to make great economies in his domestic arrangements. He sold his gallery of pictures. He had left his ministry two millions in debt (he had never touched for his own use the large sum which was dedicated to the secret service, as many of his predecessors had done); he had spent a great part of his wife's fortune. The sale of the pictures produced 443,000 livres only. "If," wrote Grimm, "they had belonged to an obscure man, they would not have fetched more than 25,000 livres." If they were sold at the present time, it is difficult to say how much they would fetch, but the sum would certainly be vastly superior to that obtained in 1772. The Duchess sold her diamonds, and, in order to protect the remainder of her personal fortune, she had to procure a sentence, at the request of her husband, of "séparation de biens," pronounced by the Châtelet of Paris on the 21st of May, 1772.

Madame du Deffand at last consented, after many tergiversations, to go to Chanteloup. She writes from there:

"The life led here suits me perfectly; one has the greatest liberty, it is the tone of the house. No compliments, no getting up for anybody; one stays in his own room or goes to the salon. You talk to whomever you like, you breakfast at all hours. At five or six o'clock, shooting or walking; supper at eight o'clock—excellent food, eighteen or twenty people at table. The first-comers seat themselves as they like; one arrives when one likes; there is no waiting for anybody. On leaving the table the mail is distributed; each one reads his own in private. News is exchanged. Cards begin; one plays, or not. . . . The conversation is very animated and agreeable, as there are many witty and companionable people."

Mme. du Deffand was afraid of being scolded by Walpole for undertaking the journey to Chanteloup; he wrote to her a severe letter, and she almost excused herself to him. She left Chanteloup after a stay of five weeks, and travelled back to Paris by very short stages. She had, she said, the malady of old age, which drives people back to their own domicile. "It is this dreadful malady which tore me away from Chanteloup. . . . I never loved Grandmamma so much, I never was so happy. . . . I have exchanged the golden age for the iron age."

The Baron von Gleichen was an old friend of the Choiseuls and made them a visit. M. Maugras enters into infinite details on all these visits, on the little incidents of the life of the exiles, on their theatrical representations, on the relations of Madame de Choiseul with her sister-in-law, Madame de Gramont. Notwithstanding all the visits they received and their numerous correspondents, life was beginning to become rather tedious to the exiles. Curiously enough, Madame du Deffand had suddenly a sort of divination: she predicted to her grandmamma that she should soon see her again, but not at Chanteloup—in Paris, in the Hôtel de Choiseul, rue de Richelieu; and so she adds: "Keep this letter, in order that it may remind you of my prediction." The Duchess answers her: "This is too strong; it savors of inspiration. What! I shall see you this very winter, and we are already in the middle of March? If you have told the truth, I shall be afraid of you. I shall believe that you are intimately in league with either God or the Devil." A month after, the prediction became a reality. Louis XV. fell ill of smallpox, and died on the 10th of May, 1774. This date marked the end of the exile of the Choiseuls.

Correspondence.

WE ARE THE SAINTS.

To the Editor of The Nation:

Sir: In your remarks upon the comment of the Paris *Temps* regarding the "general moral slump" in the treatment of the inferior races, you interpret the same as "a necessary reflex of the wave of Imperialism and conquest which has swept over the whole world within the last decade." That there is some close connection between the two phenomena seems, indeed, very probable. But, as myself anti-Imperialist, may I be allowed to suggest that the deeper question yet remains, Whence the wave of Imperialism? Shall we explain the slump by the wave, or the wave by the slump, or both by some *tertium quid?*

To me the cause seems to lie far down in a general frame of the post-Darwinian, more especially post-Weismannian, mind. It belongs to the *Zeitgeist* and the scientific spirit; it follows from the perception, whether real or imagined, of the lordship of heredity in history and in life. Time was when the doctrine that God had made of one blood all the nations was taken seriously, when the backward races were looked upon as younger brothers of the family. Only give them opportunity—freedom, education, true religion—and they would speedily approve themselves coheirs and coequals. But all this has passed away. Rightly or wrongly, modern science proclaims, *Blood will tell.* Though the children of men be as the sands of the seashore, it is only the remnant shall be saved. Only the elect belong to history; all the rest are rejected as dross from its fierce-heated furnace. All the *extra-organic* agencies of civilization, though by no means valueless, though they may and should secure the best possible result from given material, from certain definite potentialities, are yet powerless against the prepotence of the germ-plasma. They are hemmed within the narrow circle of the present generation; they may induce, but not ingrain, qualities or make them transmissible.

It seems impossible that the widespread acceptance of such dogmas should not harden the fibres of the general mind. The savant regards the plight of the organically inferior races as practically hopeless. Easier to loose the bands of Orion than the fetters which inheritance has forged for the racial soul. The hope of the future lies in perfecting the Strong, not in strengthening the Weak. The Nature-process may seem harsh and cruel and unholy, but it scorns our petty categories; it is beyond good and evil; it is beyond right and wrong. When such ideas, consciously or unconsciously, begin to rule in the head, it is well to be on guard against a stern and haughty and unsympathetic heart; Imperialism and Nietzsche are not far away. But pity supreme will yet assert itself, and in some way effect a reconciliation of science and humanity.

William Benjamin Smith.

Tulane University, New Orleans,
February 23, 1903.

[It may be instructive to recall the attitude of the apostle of heredity and natural selection towards the backward races. In chapter ii. of Mr. Darwin's 'Journal of a Voyage' (the scene is Brazil), one reads:

"As it was growing dark we passed under one of the massive, bare and steep hills of granite which are so common in this country. This spot is notorious from having been, for a long time, the residence of some runaway slaves, who, by cultivating a little ground near the top, contrived to eke out a subsistence. At length they were discovered, and, a party of soldiers being sent, the whole were seized with the exception of one old woman, who, sooner than again be led into slavery, dashed herself to pieces from the summit of the mountain. In a Roman matron this would have been called the noble love of freedom; in a poor negress it is mere brutal obstinacy."

"While staying at this estate, I was very nearly being an eye-witness to one of those atrocious acts which can only take place in a slave country. Owing to a quarrel and a lawsuit, the owner was on the point of taking all the women and children from the male slaves, and selling them separately at the public auction at Rio. . . . I may mention one very trifling anecdote, which at the time struck me more forcibly than any story of cruelty. I was crossing a ferry with a negro who was uncommonly stupid. In endeavoring to make him understand, I talked loud and made signs, in doing which I passed my hand near his face. He, I suppose, thought I was in a passion and was going to strike him; for instantly, with a frightened look and half-shut eyes, he dropped his hands. I shall never forget my feelings of surprise, disgust, and shame at seeing a great powerful man afraid even to ward off a blow directed, as he thought, at his face. This man had been trained to a degradation lower than the slavery of the most helpless animal."

In chapter xxi.:

"On the 19th of August we finally left the shores of Brazil. I thank God I shall never again visit a slave country. . . . Near Rio de Janeiro I lived opposite to an old lady who kept screws to crush the fingers of her female slaves. I have stayed in a house where a young household mulatto, daily and hourly, was reviled, beaten, and persecuted enough to break the spirit of the lowest animal. I have seen a little boy, six or seven years old, struck thrice with a horse-whip (before I could interfere) on his naked head, for having handed me a glass of water not quite clean. I saw his father tremble at a mere glance from his master's eye."

In chapter ix.:

"This posta was commanded by a negro lieutenant, born in Africa; to his credit be it said, there was not a ranche between the Colorado and Buenos Ayres in nearly such neat order as his. . . . A short time before, a body of Indians had travelled past in the night; if they had been aware of the posta, our black friend and his four soldiers would assuredly have been slaughtered. I did not anywhere meet a more civil and obliging man than this negro; it was therefore the more painful to see that he would not sit down and eat with us."

We have no fear that our last extract will appear an anti-climax south of Mason and Dixon's Line, where to be shocked at cruelty is both more intelligible and more pardonable than to be pained by caste distinctions at table, even when voluntarily observed in deference by "inferiors."—Ed. Nation.]

To the Editor of The Nation:

Sir: Darwin ('Origin,' pt. 2, chap. 21) says:

"But since he [man] attained to the rank of manhood, he has diverged into distinct races. . . . Some of them—for instance, the negro and the European—are so distinct that, if specimens had been brought to a naturalist without any further information, they would undoubtedly have been considered by him as good and true species."

The importance of the subject (since no one may to-day doubt that racial lowering is the unpardonable sin against Nature, and consequently that such measures as have any tendency thereto are, however lofty their motives, in the gravest catalogue of political error) will, I trust, warrant my asking what weight and bearing you attach to an unchallenged statement, of the nature of this of Mr. Darwin, in the question of negro officeholding, etc., etc., so warmly advocated in your last issue.

Yours respectfully, B. S.

Philadelphia, February 26, 1903.

[Mr. Darwin is arguing from the confessed brotherhood of man against the doctrine of fixed species, and raises no question of superior or inferior in the "distinction." The "weight and bearing" of his "unchallenged statement" on his own behavior towards races distinct from the European is shown in the extracts given above. That "racial lowering" which has produced our parti-colored Southern population went on in a state of slavery, was never deemed reprehensible by those responsible for it, and was a sin not against Nature, but against human nature, being effected through lust and force. Nature knows no forward or backward races, fauna or flora.—Ed. Nation.]

THE BETTER THOUGHT OF THE SOUTH.

To the Editor of The Nation:

Sir: In view of the prominence which the *Nation* has given recently to the discussion of the "race problem" in the South, will you kindly publish this paragraph from the letter of February 24 of the Charlotte (N.C.) *Observer's* Raleigh correspondent?

"An unfavorable report was made in the [North Carolina] Legislature to-day on a bill providing that each race can be separately taxed to increase its school facilities, and allowing the taxation of each race separately for its schools."

This is probably the end of the agitation of this measure, which was begun in the State several years ago, but which has been opposed vigorously and consistently by the Governor of the State, the State Superintendent of Public Instruction, and the leading educators and public men of the State.

G. S. W.

Westminster, Md., February 24, 1903.

ONE FRIENDLY WORD FOR THE FILIPINOS.

To the Editor of The Nation:

Sir: With reference to the letter entitled "One Complexion for All Rebels," in your issue of January 22, I should like to be allowed to say that at least one American officer at the seat of the war wrote letters which gave a very different account of the Filipinos from that which Lord Percy gave of the fighters for American independence. I may say that my corre-

spondent is one of the most distinguished officers in the United States Army, and that, after winning new distinction in the struggle with the Filipinos, he was entrusted with an important civil post. This is what he said:

"Future history, posterity, will never justify or condone our course over here unless we make it patent to the world, and to the natives themselves, that our coming has been a blessing to them; and I am not sanguine as to this. The great moral peril, in my opinion, of the republic is the temptation to exploit for our own benefit the inferior races. I hope, however, or try to hope, that our policy may be shaped by the best Americans instead of by the composite American; that the stream may rise, or seem to rise, a little higher than its source. The natives here are a kindly race, with the impulses, good as well as bad, common to our human brotherhood and sisterhood. Their position is a very pathetic one. Remembering your generous sympathy for the struggles and perplexities of the Italians, I am tempted to write at length about the Filipinos; but it would require a pamphlet instead of a letter, and I forbear. It is a hopeful sign that the United States has made a vigorous beginning in the establishment of schools, and that the natives seem anxious to learn."

I may add that the English officers who have returned from South Africa all speak with friendliness and even with enthusiasm of the Boers.—Yours respectfully,

EVELYN MARTINENGO CESARESCO.

SALÒ, LAGO DI GARDA, February 17, 1903.

THE SUPREMACY OF THE BRITISH PARLIAMENT.

TO THE EDITOR OF THE NATION:

SIR: My friend Mr. Albert Dicey, in his work on Constitutional Law, the sixth edition of which I have been reading, treats the power of the British Parliament as perfectly sovereign and unlimited. So do other writers on the subject. But is this absolutely correct? At the head of the statute-book stands the Great Charter, which, though Parliament repeatedly confirmed it, is not an Act of Parliament, but a fundamental covenant between the Crown and nation. "The Great Charter," says Stubbs, "is the act of the united nation, the Church, the Barons, and the Commons for the first time thoroughly at one." Is not, then, the authority on which the Charter rests one external and superior to Parliament? Is not the Charter still binding? Much of it, of course, is obsolete. Not so the famous article forbidding the infliction of any penalty on a layman without the judgment of his peers, which is plainly disregarded when the Crown is allowed, in exercise of an assumed prerogative of proclaiming martial law, to inflict upon freemen the punishment of death or other penalties by military tribunals. The question is at least curious.

GOLDWIN SMITH.

FITZGERALD AS A PROPHET.

TO THE EDITOR OF THE NATION:

SIR: In your issue of February 19, 1903, you printed a note from Mr. Alfred L. Ripley, who quoted this remark made by Edward FitzGerald in 1840, on Carlyle's 'French Revolution': "I don't know a book more certain to evaporate away from posterity than that, except it be supported by his other works." Mr. Ripley says amen to this in these words: "Few literary prophecies can show more complete justification than this, sixty odd years after utterance."

One would like to ask what Mr. Ripley considers a test of evaporation? During the past six or seven years I have seen seven new issues of Carlyle's 'French Revolution,' some of them printed in popular form and having a large circulation. There have doubtless been editions which I have not seen. An examination of publishers' sales throughout the English-speaking world since 1895 would probably show that the 'French Revolution' has outsold during this period any other historical work, old or new, printed in English. For any work to show such vitality sixty-five years after its first appearance, can hardly be taken as a sign that it has "evaporated." Most authors would be content if they could be assured of such "evaporation."

Mr. Ripley may like to know, further, that recently 'Sartor Resartus' has been reprinted in popular editions, selling at a few pence a copy, and has been sold by the hundred thousand in Great Britain.

Let us get all the delight we ought from quaint FitzGerald, but don't let us make a prophet of him, or somebody will be reminding Mr. Ripley that FitzGerald found 'Pendennis' stupid, and the songs in "The Princess" poor, and "In Memoriam" far below the volumes of 1842, and that he regarded Crabbe as a great poet and had an unusual admiration for Barton. FitzGerald's forte as a critic was genuineness, not infallibility. His likes and dislikes were a part of himself; they were not regulated by rules laid down in literary histories.

But perhaps Mr. Ripley attaches an esoteric meaning to "evaporation" which does not appear from his letter.

WILLIAM ROSCOE THAYER.

CAMBRIDGE, MASS., February 23, 1903.

Notes.

In preparation at the Clarendon Press, Oxford, are 'Oxford Art Collections,' being reproductions of drawings by the old masters preserved in the collections of the University and of Christ Church, with introductions and annotations by Sidney Colvin; 'The Letters of Horace Walpole,' edited by Mrs. Paget Toynbee, in sixteen volumes, with numerous portraits; 'Elizabethan Critical Essays (1570-1603),' edited in two volumes by G. Gregory Smith; 'The Mediæval Stage,' by E. K. Chambers, also in two volumes; 'The Early History of Baptism,' by Clement F. Rogers; 'Sources of Roman History,' by A. H. J. Greenidge and A. M. Clay; 'French Versification,' by L. K. Kastner; 'Napoleonic Statesmanship: Germany,' by H. A. L. Fisher; and the third series of Dr. Moore's 'Studies in Dante.'

Forthcoming from D. Appleton & Co. are 'The History of Puerto Rico,' by R. A. Van Middledyk, with an introduction by Prof. M. G. Brumbaugh; Lavignac's 'Musical Edution,' translated by Esther Singleton; and 'The Autobiography of Joseph Le Conte.'

Henry Holt & Co.'s spring announcements embrace a translation of Auguste Fournier's 'Napoleon I.,' under the editorship of Prof. E. G. Bourne of Yale, and equipped with a critical bibliography of Napoleonic literature; 'An Atlas of European History,' by Prof. Earle W. Dow of the University of Michigan; 'Variations in Animals and Plants,' by Dr. H. M. Vernon of Oxford; Tarde's 'Law of Imitation,' translated by Elsie Clews Parsons, Ph.D.; and an Italian grammar by Prof. Mary V. Young.

The rather remarkable announcement comes from Copenhagen that two editions of the writings of the Icelandic poet and novelist Gestur Pálsson are to appear shortly—one, containing only the poetical works, in Reykjavik; the other, including, in addition to the complete original works in poetry and prose, a number of translations from different languages, in Winnipeg. This fuller edition will be in four volumes, of about 250 pages each, and it will be published by a number of Icelanders in Winnipeg, the possible profits to be used to erect a suitable monument over the author's grave. Pálsson was in some respects perhaps the most original of the recent Icelandic writers. He excelled in the short story, the form by which he is best known to foreign readers, his vein being as a rule satirical. He was born on the west coast of Iceland in 1852, his father being a poor peasant. From 1875 to 1882 he studied at the University of Copenhagen, and on his return home he became editor of a weekly newspaper published at the capital. In 1890 he went to Winnipeg as editor of an Icelandic paper published there, and died the following summer. The attention of all interested in modern Icelandic literature is directed to the unselfish effort of these Winnipeg Icelanders to honor the memory of their brilliant countryman.

Consolidation is announced of the firms of E. & J. B. Young & Co. and Thomas Nelson & Sons, under the corporate name of Thomas Nelson & Sons.

The sixth volume of Hearne's 'Remarks and Collections' (Oxford Historical Society) contains, in addition to the usual antiquarian lore, a number of particulars of interest to those who are concerned about the history of Maryland. It appears that Hearne made the acquaintance at Oxford of Benedict Leonard Calvert, younger brother of the fifth Lord Baltimore (and later Governor of Maryland), then a student at Christ Church. Finding him a young gentleman of estimable character, scholarly attainments, and a very creditable respect for antiquities, Hearne conceived a strong regard for him, and obtained from him many particulars about the Calvert family, some of which seem to have escaped the notice of biographers. In particular, he copies out a pedigree of the family, drawn up for him by young Calvert, by which we can correct some errors that have crept into the books, and (in one case at least) found admission even into the 'Dictionary of National Biography' and the 'New International Encyclopædia.'

'The Boy's Iliad,' by Walter C. Perry (Macmillan), is a well-told story in simple, flowing language, which retains the Homeric ring and flavor. A novel and commendable feature is that the strictly Homeric tale is rounded out by a narrative of the incidents which precede and follow the story of the Iliad, such as the education of Achilles, the episode of Penthesilea, and

the ruse of the wooden horse. The illustrations are attractive, and there is a good index which mingles instruction with pleasure by careful marking of quantities. The book will appeal to boys and girls under twelve, and possibly somewhat older; and they will easily penetrate the disguise under which Aias and Aineias and Aiakides present themselves.

Part VIII. of Prof. R. F. Harper's 'Assyrian and Babylonian Letters' appears as one of "The Decennial Publications of the University of Chicago." The first part appeared in 1892. His intention, as announced, is to publish the cuneiform texts of all the letters contained in the Kouyunjik collections of the British Museum, which have been catalogued by Bezold, in perhaps sixteen small volumes, and to follow this by a similar publication of translations and notes, with a glossary, occupying as many volumes more. It is a monumental work, but, unlike monumental works of the olden time, it appears in small and handy volumes (octavos, 6x9) of about 150 pages each. Each page contains the text of one letter, with the name of the scribe as a page heading. There are very elaborate and modern indices, four in all, and double-page headings for the volume and for the series. The letters are arranged according to the names of the scribes by whom they were written. This volume brings us down to letter 876. The series, which represents much hard, dry, mechanical labor in copying the most difficult description of manuscripts, is a welcome addition to the material available to the Assyriologist for linguistic study, and the promised volumes of translations should make it valuable for politico-social and historical investigators.

The list of books written by Japanese in European languages is already a respectable one, and two recently issued from the press of Z. P. Maruya & Co. in Tokio are worthy of notice. The interesting work of Mr. I. Hitomi, entitled 'Le Japon: Essai sur les Mœurs et les Institutions,' has reached its second edition. Its 200 pages contain choice and condensed information concerning the political history, religion, fine arts, literature, music, and manners of the author's countrymen. He has a scholar's knowledge of the traditions and the mediæval and modern story of Japan, besides being fairly well acquainted with European literature and with the ideas of Occidentals, but he lacks or declines to use criticism of authority. Hence his credulity as to the origins of the Japanese and of ancient history in the archipelago is almost childish. In an appendix are some useful tables and figures. Mr. Kuré, the compiler of a useful little book (pp. 78), entitled 'History and Theory of Statistics,' says in his introduction: "I have chosen English, as it is the most popular and important foreign language in our country." Making use of the best British and German authorities, he discusses the history of the science, or perhaps we should say the method, of statistics, its contents and procedure, points out the snares and dangers of unscientific handling of figures and reports, and thus furnishes for his countrymen a useful handbook which will aid them in a line of intellectual industry increasingly in favor in Japan.

A compact duodecimo of 300 pages bears the title 'Handbuch der Bibliographie' (Vienna: Hartleben; New York: Lemcke & Buechner). The author, Friedrich Johann Kleemeier, has aimed at a brief introduction to the practical knowledge of books and to cataloguing. He surveys in sixty pages the origin and spread of the art of printing; next takes up the book in the elements of its manufacture, gives a section to collating and another to incunabula; passes to illustrations; and yields nearly half his space to the forming of collections, arrangement, cataloguing, repairs, etc. A convenient appendix is a Latin-German index of early city imprints, from Aarhusium (Aarhuus) to Zwolla (Zwolle), and there is another of abbreviations pertaining to books. The "Literatur" or bibliography proper fills fifty pages, and is no slight recommendation of this business-like manual.

Descendants of Stephen Hopkins of the *Mayflower* will be interested in Mr. George Ernest Bowman's unbiassed discussion of the identity of the daughter Damaris in the January numbers of the *Mayflower Descendant* (Boston). Mr. Bowman plausibly argues that the Damaris brought over died early, and was succeeded by a namesake born on this side of the water.

Those who are curious to judge for themselves the new reputed portrait of Dante, by Orcagna, in the Cappella degli Strozzi, in Santa Maria Novella, Rome, will find a good copy of it in the Roman weekly "review of reviews," *Minerva* (issue of February 8). The profile is to right, and the head above the lower part of the forehead is concealed by a hat.

The work of the U. S. Hydrographic Office is described in the *National Geographic Magazine* for February by its chief, Commander Southerland. A brief sketch of the history and organization is followed by an account of the surveys by the navy, the tangible results of which are 1,250 charts available for permanent issue. By this means not only have our maritime interests been benefited, but the efficiency of the navy has been increased by educating the officers' powers of observation and familiarizing them with coast work. During the last fiscal year 24 naval vessels have been engaged in practical surveying operations in many parts of the world. At three of the branch stations night lectures on navigation are given to shipmasters, and notices affecting navigation are issued at the rate of about fifty a week. The Pilot Chart of the North Atlantic Ocean for February, 1903, accompanies the article. Mr. W. E. Curtis gives a sketchy and not entirely accurate account of Bosnia, Bulgaria, and Servia, the impressions of a recent visit to those countries. His references to Russia's part in the recent history of these Balkan states seem out of place in a scientific magazine whose editor and nine of his associates are United States officials. There is a reassuring statement from the Weather Bureau in regard to the rapid decline of the water level of Great Salt Lake during the past few years which has caused much apprehension to the people of northern Utah. It is due wholly to the failure of precipitation during a dry cycle of sixteen years which may terminate next year, and not to the artificial irrigation of 609 square miles.

The *Geographical Journal* for February begins with an account of explorations in Western China, by Capt. Ryder, to find the best route for a projected railway between Burmah and the province of Yunnan. This region, though rich in mineral wealth of every kind, and possessing land capable of bearing two crops annually, has not recovered from the devastation caused by the Mohammedan rebellion thirty years ago. Everywhere are to be seen "half-deserted towns and ruined villages." There was little opposition on the part of the Chinese to the survey, but Capt. Ryder received this significant warning from a coolie: " 'Sir, take my advice; get out of China as quick as you can. This year will be a bad year for foreigners in China.' This was in January: the troubles in North China [1,500 miles distant] commenced in May." Carl Lumholtz gives a too brief summary of his five years' researches in northwestern Mexico, mainly under the auspices of the American Museum of Natural History of New York. But we shall have occasion shortly to speak of his published work on this subject. Among the book reviews is a most appreciative notice of Dr. Furness's 'Home Life of the Borneo Head-Hunters,' by Dr. A. C. Haddon, head of the Cambridge Anthropological expedition to Borneo, who says that "to one who has travelled over the same ground, it recalls many similar experiences, and deserves unqualified praise for accuracy alike of fact and impression."

In the *Annales de Géographie* for January is a summary of the recent investigations of plankton, those animal or vegetable organisms which live on the surface of salt or fresh water, or at a depth more or less great, but without touching the bottom. They are economically valuable in that "their abundance is one of the factors determining the productive power of the ocean for all species, and particularly those which are edible." In an illustrated description of a section of the valley of the lower Amazon it is said that the rubber industry is driving out agriculture, and "giving to an absolutely new region the aspect of an old country falling into decay. . . . The cultivation, formerly so prosperous, of rice, indigo, coffee, cotton, is almost abandoned," and the pure food products, grain, manioc, farina, are so neglected that "the people are now liable, a thing incredible, to be visited by veritable famines, as was the case in 1901." Other articles are upon the new English and German pilot charts, in which high praise is extended to the rich and varied work of our Hydrographic Office, on the trans-Mantchurian railway, and the oscillations of the west coast of Brittany. There is also a colored map in three sheets showing the new boundary between Chile and Argentina.

Mr. Robert T. Swan's fifteenth report on the custody and condition of the Public Records of Massachusetts has the same title as its predecessors to widespread attention. It is particularly valuable for its summary of the statutes defining the reciprocal duties of the Commission and the custodians of records (even when these are church records, in the contingency of a dissolution). In a body of fresh information we are told that the town of Medford has an index of its records from the year 1673, and a card index of "the record of every birth, intention of marriage, and death," with a reference to "every baptism and marriage on the records of the First Parish, beginning in 1712," to gravestone inscriptions in old cemeteries, and to family Bibles and genealogies. Since the establishment of the

Commission, no town has lost all its records, and but two volumes for which there are no substitutes have been destroyed by fire. The "State Standard Ink" formula has been adopted by the United States Treasury Department, and the authorized type-writer ribbons have withstood a very severe test of exposure to sunlight.

Dr. Livingstone is accused by Kruger in his Memoirs of having aided the Kaffirs in their struggles with the Boers by having in his house "a complete workshop for the repairs of firearms and a multitude of war materials, which Livingstone kept stored up for Secheli's use." The falsity of this charge is convincingly proved by the Rev. J. S. Moffat, brother-in-law of the great missionary, and for many years a South African official, in an interesting letter to the London *Times* full of personal reminiscences. Referring to the Sand River convention of 1852, forbidding the supply of arms or ammunition to the natives, which Kruger says Livingstone violated, Moffat asserts: "To my certain knowledge, the Boers have done a very large share in arming the natives themselves." It surely ill becomes Mr. Kruger "to try to asperse the memory of a man whose one object in life was to do his duty to the sorrowful and oppressed races of the dark continent."

The death of the chief Ultramontane *politicus*, Dr. H. J. A. M. Schaepman of Holland, at Rome, January 21, removes from the Lower House of the States-General the most conspicuous member of the Catholic wing of the anti-revolutionary (fusion) party, which won a victory at the polls in the summer of 1901, overthrowing the old Liberal party and installing Dr. Abraham Kuyper, an ultra-Calvinist, as Dutch Premier. Apart from Dr. Schaepman's acknowledged political ability, both as orator, campaign manager, and organizer of forces in the House, he enjoyed a unique reputation in the Dutch-speaking world for his exquisite prose style, his poems, and his numerous literary productions, which were remarkable alike for their clearness, strength, and finish. Born in 1844, he received his doctorate at Rome in 1869, and entered the Catholic Seminary at Rysenburg as professor in 1869, and the House of Representatives in 1880. The later years of his life, as professor in the seminary at Rysenburg and as editor of *Our Watchman* and *Het Centrum* (The Centre), were marked by intense activity. He was one of the prominent figures during the coronation festivities of 1898, having already been admitted into and decorated with the insignia of most of the Dutch royal orders. One volume of his poems is in the fourth edition. Since 1901, he had been house-prelate and prothonotary in the papal household. The Dutch-Americans as well as the Netherlands bemoan the fact that, his writings being in Dutch, his literary light is hidden under a bushel.

—The appeal of the March *Century* is primarily to the man of affairs. Ray Stannard Baker opens the number with the first paper of a series on "The Great Northwest," following the same general lines as his series of last year on the Southwest. Ernest Blumenschein replaces Maxfield Parrish as the illustrator. Jacob A. Riis writes of the "Gateway of Nations" (Ellis Island), while Gustave Michaud and Prof. Franklin H. Giddings discuss the question "What Shall We Be?" in view of the various elements constantly pouring through this gateway. The English language and the traditions of the English law, we are told, will remain. The thought and the social life of the people must be largely influenced by the admixture. But the outlook is hopeful. "The proportions will be such as to make a people strong and plastic—with possibilities of action and expression, of grasp upon the garnered experience of the race, and of daring outreach into the things that as yet have never been, such as no people has yet shown." Will Payne writes of the Chicago Board of Trade, describing the exciting operations of the grain market, and arguing strongly for the general advantage to be gained from the speculative dealing in grain, which makes of wheat "a liquid asset everywhere in the United States." For this reason, and this alone, we are told, the grain grower can borrow on his wheat from 75 to 85 per cent. of its current price, while on the land upon which it was grown he cannot obtain more than 50 or 60 per cent. The "so-called" Tobacco Trust is described by George Buchanan Fife, and Herman Justi makes a plea for the organization (as distinguished from consolidation) of capital as the best means of dealing fairly and successfully with organized labor.

—Henry Augustus Rowland being a name upon which attention will inevitably be arrested in any extensive future history of the development of human knowledge, the future reader of that history may ask, "How came such a tree to grow to such proportions in such a soil?" Well, it happened that the duty of tending that tree fell upon a university president of such singular discernment as not to take fright at meeting with a real live man, a man obtrusively and naïvely real and personal; and so the tree was supplied with the desirable fertilizer, and quite indispensable vacancy, without which its growth might have been vigorous, but never could have attained to largeness and symmetry. Had Rowland been a growth of French soil, the publication of his complete works would have been undertaken by the Government, and would have been executed in such style as seemed worthy of a nation in the van of civilization. Let us hope that some complete publication may somehow be made yet. Meantime we receive from the Johns Hopkins University a cheapish reprint ('The Physical Papers of Henry Augustus Rowland') of his experimental works, some of them too much abridged to answer all the purposes of the critical student. The volume contains, besides, some public addresses and other writings which we are thankful to find thus made available. Those works by which Rowland most stirred physical thought, and upon which his place among those American physicists who, since Rumford, have influenced fundamental conceptions (if any other such there be), must mostly depend, are omitted. It is said, in excuse for this strange method, that Rowland himself did not desire the republication of those papers. We are not told why; but Rowland certainly did not depart from the usual type of genius in that his judgment was less sure than that of ordinary men. Those who knew him would not be surprised to hear that he had passed through a phase in which, like Pascal, he thought mathematics an idle amusement. But this should not have influenced the editors.

—'Tolstoy as Man and Artist,' by Dmitri Merejkowski (G. P. Putnam's Sons), embraces also an essay on Dostoyevski. The book is critical as well as biographical, and, if it were more readable, would attract a great deal of notice, for, to mention only one point, the picture drawn of Tolstoy is quite different from that which the ordinary reader of 'War and Peace' and 'The Kingdom of God is within You' have formed. We will not go so far as to say that Merejkowski seeks to represent Tolstoy as a humbug, but there are many pages in his book which will be painful to those to whom Tolstoy is seer and prophet, *e. g.*, when he is referred to as "lying on his back and wailing in the high grass, as you and I and all the rest of us." We are very much disinclined to be drawn into any "appreciation" of Merejkowski, for we are not at all sure as to what the intention of his volume is. It is obscure, involved, contradictory, and exaggerated, and at the same time argumentative, if not contentious—a bad assemblage of qualities for critical writing. Dostoyevski is contrasted with Tolstoy as "the artist most contrary" to the latter "in the literature of all ages and natures." This is a specimen of our author's exaggeration. Certainly the two writers do not belong to the same school, but, as this critic very well knows, they are akin; in the next line he declares they are "not alien." On the whole, the volume is disappointing. It arouses expectations, but does not satisfy them.

—The last Quarterly Statement of the Palestine Exploration Fund contains the second report of the excavation of Gezer. Mr. Macalister has uncovered an ancient megalithic temple consisting "of a row of seven monoliths, with an eighth standing apart, and flanked by stumps of two others"; the first megalithic monument ever unearthed. The large stones in this monument vary in height from seven to almost eleven feet. The holy stone *par excellence* is not one of these giants, but a stone about the height of a man, five feet five, the upper end somewhat pointed and rubbed smooth by the kissing, anointing, or other handling of the worshippers. The form of this stone and that of some of the larger stones which support and, as it were, honor it, indicates the ideas of nature worship connected with this temple, and the abundant votive objects found in and about these stones make clear the character of that worship. Mr. Macalister also found in connection with this temple what seemed to be evidences of child sacrifice. He traces the history of this temple, if such a primitive, uncovered place of worship may be called a temple, from a prehistoric period, 2000 B. C., or earlier, on to about 600 B. C. From present evidence it seems to have been a sanctuary of the early Semitic inhabitants, worship at which continued after the Hebrew conquest, although the size of the temple diminished—an evidence of diminished importance. After the captivity, the site lost its sanctity—evidence again of the thoroughgoing monotheism of the post-exilic period. Among the other interesting discoveries reported are the remains of a primitive population, troglodytic at the outset, which, from skull measurements and other indications, would seem not to have been Semitic. To them is to be ascribed the commencement of those remarkable caves, at some places of

almost incredible number and extent, which are so striking a feature in this part of Palestine. A characteristic point of difference between these earliest known inhabitants and their Semitic successors is that the former burned their dead, whereas the latter practised burial from the outset. This accords, also, with the latest results obtained in Babylonian excavations. It is worth noting that these earlier inhabitants used exclusively stone for weapons and utensils. Copper seems to have come in with the Semites. Iron appears at the time of the great upheaval which brought in the Israelites, and threw on the shores of Palestine the Philistines and other invaders from the north and west, 1400-1000 B. C. Mr. Macalister's excavations give us the most extended record yet obtained from any Palestinian site, beginning probably about 3000 B. C. and continuing to about the beginning of the Christian era.

—What are called the oldest documents in Indo-European have lately been deciphered and published by Dr. J. A. Knudtzon, with explanatory notes by Bugge and Torp. The pamphlet, entitled 'Die Zwei Arzawa-Briefe,' is likely to provoke considerable discussion, nor are all its results certain; but it seems to have established one most important historical fact, equally interesting to scholars in the Babylonian and in the Indo-European field. Though too technical to be described in detail, the chief points in this remarkable find are as follows: Among the clay tablets of el-Amarna in Egypt are two which, with the exception of some passages, contain linguistic elements not of Babylonian-Assyrian character, but apparently of Indo-European origin. The tablets, one at least, seem to have been sent to "Arzawa," a country corresponding to Eastern Cilicia or Southern Cappadocia (in Knudtzon's opinion), and ruled over by a King Tarhundaraba (*cf.* Tarquin, etc.). The interpretation of the letters is possible only on the assumption of the Indo-European character of the language, which seems to be related to Lycian, Armenian, and even Hittite, the group that Bugge now calls "Anatolian." Among many exegetical ventures of more dubious nature, this Arzawa tongue is fairly well established as Indo-European in having the verbal form *esto* (Latin *esto); n* as sign of the first person preterite (Greek *ν*); the accusative in *m* and the genitive in *s* (Greek and Latin); the imperative in *k* (Lithuanian); the superlative in *ma (human,* Latin *summum);* and the personal pronouns, *mi, min, ti, tin,* respectively genitive and accusative of the first and second persons, besides *mu* (Greek μοι) and *imi* (Greek ἐμέ). In its genesis this newly discovered Arzawa language offers a pretty parallel to Albanian; for its vocabulary has been changed, but on the new foreign words are still fitted the old inherited endings. The discovery, finally, suggests a deal more than it explains in respect of the earliest relations between the Indo-Europeans in "Anatolia" and their Semitic conquerors, and will probably revive interest in the Hittites and "Anatolians" themselves, while putting into new form the more concrete question as to the prehistoric relations of the Cretans and Greeks with their Eastern neighbors.
